Energy Research Abstracts

Abstracts 22978-25033

Office of Scientific and Technical Information
UNITED STATES DEPARTMENT OF ENERGY

The Office of Scientific and Technical Information

The Office of Scientific and Technical Information (OSTI) in Oak Ridge, Tennessee, provides direction for the Department of Energy's scientific and technical information (STI) program and maintains a centralized base of support to assist Departmental elements in planning, developing, and implementing STI activities. DOE-originated and worldwide literature and software on advances in subjects of interest to DOE researchers are collected, processed, and disseminated using computerized databases, publications, and other media.

This information collection, containing over three million citations, represents a major national resource of scientific and technical information. In addition to information from DOE and its contractors, DOE acquires information through its international partnerships with the International Energy Agency's Energy Technology Data Exchange (ETDE), a consortium comprised of members from North America and Europe, Japan and Korea; the International Atomic Energy Agency's International Nuclear Information System, representing 80 countries; bilateral agreements with foreign governments; exchange agreements with other U.S. government agencies; and contracts with private information organizations and professional societies.

The subject scope of this information extends beyond energy, covering basic scientific studies in such areas as radiology, atomic and nuclear physics, radiation and nuclear chemistry, superconductivity, supercomputers, the environment, health and safety, waste management, nuclear medicine, and arms control.

Major DOE databases are available within the United States through DIALOG Information Services and STN International and outside the United States through formal governmental exchange agreements. DOE and DOE contractor offices can access the databases online through the Integrated Technical Information System (ITIS) maintained by OSTI.

Energy Research Abstracts

Coverage

Energy Research Abstracts (ERA) provides abstracting and indexing coverage of all scientific and technical reports and patent applications originated by the U.S. Department of Energy, its laboratories, energy centers, and contractors, as well as theses and conference papers and proceedings issued by these organizations in report form. Audiovisual materials, computer media (magnetic tapes, diskettes, etc.), and engineering drawings are included in this definition. *ERA* also covers other energy information prepared *in report form* by federal and state government organizations, foreign governments, and domestic and foreign universities and research organizations, *provided* that the full text of the document has been received by OSTI. Foreign report information is obtained through the International Energy Agency's 18-nation Energy Technology Data Exchange, the International Atomic Energy Agency's International Nuclear Information System, or nation-to-nation agreements. The purpose of this publication is to announce documents produced or obtained by DOE that are not so readily available as journal articles, books, or patents.

Scope

The scope of *ERA* encompasses DOE's research, development, demonstration, and technology programs resulting from its broad charter for energy sources, supplies, safety, environmental impacts, and regulation.

The citations presented in *ERA* are available for online searching as records within the Energy Science and Technology Database (EDB). The current-year records are available on the Integrated Technical Information System (ITIS).

Availability

DOE and DOE contractors can obtain *ERA* (regular issues and annual indexes) by using VISA, MasterCard, or OSTI deposit accounts. Contact the Office of Scientific and Technical Information, P.O. Box 62, Oak Ridge, TN 37831, Attention: Information Services. For further information, call (615)576-8401. *ERA* is also available at authorized GPO Depository Libraries. (List is provided on the inside back cover.)

ERA (regular issues and annual indexes) is available to the public on a subscription basis from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Managing Editor, Leota S. Kane
Technical Editor, Barry C. Steele

Information Sources

The citations presented in *Energy Research Abstracts* are a subset of the worldwide energy information provided to the Office of Scientific and Technical Information (OSTI) through exchange agreements with foreign sources and through exchanges or contracts with U.S. organizations.

The **Energy Technology Data Exchange (ETDE)** was established by the International Energy Agency to promote cooperation among members in conducting appropriate energy-related research and development programs through the development of a formal central information sharing system. In accomplishing the objectives of the ETDE, members select, abstract, and index relevant research information published in their countries in accordance with Exchange standards. OSTI serves as the central receiving and processing center for this information, which it then disseminates to national centers in the participating countries. The following countries are currently members of the ETDE:

- Australia
- Brazil
- Canada
- Denmark
- Finland
- France
- Germany
- Italy
- Japan
- Norway
- Poland
- Republic of Korea
- Spain
- Sweden
- Switzerland
- The Netherlands
- United Kingdom
- United States

The **International Nuclear Information System (INIS)** was established to promote the exchange of information on nuclear science and technology. Its operation is similar to that of the ETDE, with the INIS Secretariat being located in Vienna, Austria. Currently, 79 countries and 15 international organizations are members of INIS. OSTI serves as the INIS national center for the United States.

In the exercise of its rights and responsibilities under the agreements to which it is a party, the **Office of Scientific and Technical Information** both receives information from the above sources and submits U.S.-produced information to them. In addition to materials generated by the Department of Energy, this U.S.-produced information is gathered from other government agencies as well as under contract with private information processing companies. All input is computer processed and entered into a database for online retrieval. The database serves as well for the production of numerous OSTI publications.

How To Read A Citation

The principal data elements included in these citations are:

1. **Abstract number** within volume.
2. **Report number** identification for report-type literature.
3. **Title and subtitle** (non-English title may appear in parentheses, if applicable).
4. **Author(s).** First 10 names in the data record are printed, then "et al." is listed.
5. **Author affiliation.** Only first one is listed, in parentheses after author(s) to which it applies.
6. **Collaboration,** if present.
7. **Corporate author(s)** identifying corporation responsible for document.
8. **Date of publication.** If not known, a processing date is in brackets.
9. **Number of pages** or page range. Prices are based on total pages unless special pricing applies.
10. **Language** of document if non-English.
11. **Monograph title** if citation is an analytic (part, chapter, or paper) of a larger monograph.
12. **Sponsoring organization.**
13. **Contract or grant number.**
14. **Secondary identifying number;** may be a conference number.
15. **Conference title, location, and date,** if applicable.
16. **Order number.** The "DE" order number may be used for ordering from NTIS or OSTI, as appropriate. The "TI" prefix is valid only at OSTI.
17. **Sources of availability** from which a copy of the document may be obtained; usually appear as abbreviations. (See information on following page.)
18. **Drop note** or explanatory statement.
19. **Abstract.**
20. **Subject descriptors.** Listed only if no abstract or only a brief statement is included.

Canada Mortgage and Housing Corp., Ottawa, ON (Canada). 1990. (CONF-900724-Vol.1: Indoor Air '90: 5th international conference on indoor air quality and climate, Toronto (Canada), 29 Jul - 3 aug 1990). In Indoor air '90: The fifth international conference on indoor air quality and climate. Volume 1: Final report. 786p. Order Number DE90017786. Source: NTIS.

Air pollution in houses caused by combustion of coal is more serious than that by combustion of natural gas and methane (primarily by SO_2 and NO_2). The gas concentration after cooking is higher than that before cooking, and it is higher in kitchen than in bedroom and outdoor. There were mutations in the extract from TSP in $30m^2$ air in the bedroom, kitchen and outdoor, where coal and natural gas were used. The supernatant saliva activity of children whose family uses coal is significantly lower than that of pumping streams.

How To Order from the Availability Sources

TO OBTAIN A REPORT

Report literature, usually identified by an alphanumeric identifier at the beginning of a citation, is available from the sources listed in the citation (see example of element 2 on page iii). Often the sources are listed as abbreviations. Corresponding addresses are provided at right from which documents with these abbreviations may be ordered. When "OSTI" is given, **DOE and DOE contractors may order these documents from OSTI.** (However, check with your library or information organization which may require that orders go through them to OSTI.) OSTI prices are based on total pages unless special pricing applies. The public should order from NTIS or from one of the other agencies listed in the citation. NTIS price codes may continue to appear in some records. To expedite processing, an order form is provided in the back of this publication. NOTE: The order numbers provide quicker access for report ordering. Use the order number where possible.

How To Use the Indexes

Five indexes are provided for approaching the content of each issue of *Energy Research Abstracts*. Descriptions of entries in these indexes follow.

Corporate Author Index
The corporation, organization, or institution responsible for the issuance of the document is listed in this index. The entries are arranged alphabetically and provide the title and citation number of the reference. For example, the listing for the "Report" sample citation would appear as shown at right.

Wisconsin Univ., Madison (USA). Dept. of Physics
[Development of a hydrogen and deuterium polarized gas target for application in storage rings]: Progress report, 15:18494 (R;US)
Wisconsin Univ., Madison (USA). Lab. of Genetics
Organization of the R chromosome region in maize: Final progress report, June 1, 1983–May 31, 1986, 15:18255 (R;US)

Personal Author Index
Each author's name listed on a document cited in this issue is indexed. An index entry provides title and citation number; for secondary and other names, a cross-reference is given to the primary author name where the full index entry is located.

Hadley, D.L., *See* Lee, A.D., 15:17651
Haeberli, W., [Development of a hydrogen and deuterium polarized gas target for application in storage rings]: Progress report, 15:18494 (R;US)

Subject Index
This index lists the main subject descriptors assigned to each record by indexing professionals. A secondary or qualifier term is used where necessary to describe materials, objects, and processes. Document titles may be enhanced with additional informative phrases where necessary. An excerpt from this index appears at right.

HYDROGEN ISOTOPES
See also DEUTERIUM
HYDROGEN 4
TRITIUM
Neutron-Rich Isotopes
Study on the strong neutron-rich nuclei of lightest elements, 15:18686 (RA;SU;In Russian)

Contract Number Index
DOE technical reports are listed by contract number. Each entry also provides the primary corporation or organization cited for that contract number. A typical entry is shown.

FG02-88ER40438 **Wisconsin Univ., Madison (USA). Dept. of Physics**
15:18494 DOE/ER/40438–T1
FG02-88ER60664 **Rogers and Associates Engineering Corp., Salt Lake City, UT (USA)**

Report Number Index
Technical report literature is indexed by the alphanumerical identifier of the report. Patent documents and conferences are included for convenience. Each entry lists the citation number, the source of availability of the document, an indicator of presence at a GPO depository library, order number, and distribution category. A typical entry is:

DOE/ER/40438–T1	15:18494	NTIS, OSTI	E 1.99: DE89007246	MF-411

Subject Contents

The subject content of *Energy Research Abstracts* is arranged as shown below. The two-digit and four-digit category numbers printed here illustrate the category number assignment used in the database records.* The following list includes all of the 38 first-level and the 313 second-level categories. Because each issue of *ERA* publishes citations only for those documents announced during the past semimonthly period, some subject categories may not be present in every issue.

Numerical Listing of Categories

01 COAL LIGNITE, AND PEAT

Energy Research Abstracts

01 COAL, LIGNITE, AND PEAT

Refer also to citation(s) 23725

22978 (NEDO-C–9301) **Subsidies for promotion of coal production/utilization technology. Second Clean Coal Technology (CCT) Conference.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Jul 1993. 242p. (In Japanese). Order Number DE95790769. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

The paper summarizes the first and second Conferences of Clean Coal Technology (CCT) as follows: as for significance and positioning of CCT, it is important to see how CCT is related to the purpose of making a clean use of coal. CCT should be related not only to the utilization, but to all the stages of production, distribution and utilization. As international cooperation concerning CCT, it is important to make a wide variety of menu for a policy for coal clean use which is largely expected to spread. In that case, it is important to transfer technology having hardware and software in one body and train persons for it. As to technology development and a role of NEDO, CCT now seeks a new idea on the R and D and the technology development. Further, NEDO should play a principle role in the long-term technology development in the basic and introductive field of CCT.

0103 Preparation

22979 (CONF-941089–Vol.2, pp. 665-674) **Precombustion desulfurization using Microcel™ and multi-gravity separator.** Yoon, R.H. Studies conducted at the Center for Coal and Minerals Processing (CCMP) indicate that surface-based processes such as froth flotation are inefficient in removing pyrite from fine coal. This shortcoming has been attributed to the fact that pyrite can become hydrophobic under certain conditions and to the inability of flotation to reject middling particles. To overcome these deficiencies, a new processing scheme has been developed at CCMP which involved the use of the Microcel™ flotation column in combination with a centrifugal flowing-film separator, called a Multi-Gravity Separator (MGS). The flotation column removes ash-forming minerals such as clay, while the MGS is effective in removing pyrite. Preliminary test data obtained with high-sulfur coals shows that this processing scheme can nearly double the pyritic sulfur rejection with little loss in clean coal yield. This article discusses the underlying principles of the new circuit and provides test results obtained using eastern U.S. coals.

22980 (DOE/PC/91043–T13) **An investigation of the role of water on retrograde/condensation reactions and enhanced liquefaction yields. Final report.** Miknis, F.P.; Netzel, D.A.; Wallace, J.C. Jr.; Butcher, C.H.; Mitzel, J.M.; Turner, T.F. Western Research Inst., Laramie, WY (United States). Feb 1995. 117p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91043 ; FG22-91PC91310 ; FG05-89ER75506. Order Number DE95015452. Source: OSTI; NTIS; GPO Dep.

While great strides have been made in developing the technology of coal liquefaction processes in recent years, many unsolved problems still remain before a viable and economical process can be achieved. The technological problems that still exist can be solved through a more fundamental understanding of the chemistry associated with each stage of the coal liquefaction process, starting with any pretreatment steps that may be carried out on the coal itself. Western Research Institute, under the a contract from the US Department of Energy, has conducted a study of different methods of coal drying as pretreatment steps before liquefaction. The results of that study are the subject of this report. Coals that were dried or partially dried thermally and with microwaves had lower liquefaction conversions than coals containing equilibrium moisture contents. However, chemically dried coals had conversions equal to or greater than the premoisturized coals. The conversion behavior is consistent with changes in the physical structure and cross linking reactions because of drying. Thermal and microwave drying appear to cause a collapse in the pore structure, thus preventing donor solvents such as tetralin from contacting reactive sites inside the coals. Chemical dehydration does not appear to collapse the pore structure. From the study of the kinetics of the chemical dehydration of coals, it was possible to quantify the amount of water on the surface, the amount readily accessible in pores, and the amount more strongly bonded in the internal structure of the coals. The results indicate that high-rank coals have proportionally less surface and easily accessible water than the lower rank coals.

22981 (DOE/PC/92543–T10) **Micro-agglomerate flotation for deep cleaning of coal. Quarterly progress report, January 1, 1995–March 31, 1995.** Chander, S.; Hogg, R. Pennsylvania State Univ., University Park, PA (United States). Apr 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92543. Order Number DE95015535. Source: OSTI; NTIS; GPO Dep.

The development of practical technologies for the deep cleaning of coal has been seriously hampered by the problems of carrying out efficient coal/mineral separations at the very fine sizes (often finer than 10 mm) needed to achieve adequate liberation of the mineral matter from the coal matrix. In froth flotation, selectivity is substantially reduced at fine sizes due, primarily, to overloading of the froth phase which leads to excessive carryover of water and entrained mineral matter. Oil agglomeration, on the other hand, can provide good selectivity at low levels of oil addition but the agglomerates tend to be too fragile for separation by the screening methods normally used. The addition of larger amounts of oil can yield large, strong agglomerates which are easily separated but the selectivity is reduced and reagent costs can become excessive. We are investigating the use of a hybrid process - Micro-agglomerate flotation which is a combination of oil-agglomeration and froth flotation. The basic concept is to use small quantities of oil to promote the formation of dense micro-agglomerates with minimal entrapment of water and mineral particles, and to use froth flotation to extract these micro-agglomerates from the water/dispersed-mineral phase. Since the floating units are agglomerates (about 30-50 mm in size) rather than individual coal particles (1-10 mm) the problems of froth overload and water/mineral carryover should be significantly alleviated. There are, however, complications. The process involves at least five phases: two or more solids (coal and mineral), two liquids (oil and water) and one gas (air). It is necessary to maintain precise control over the chemistry of the liquid phases in order to promote the interfacial reactions and interactions between phases necessary to ensure selectivity. Kinetics as well as thermodynamic factors may be critical in determining overall system response.

The oil- and gas-fired turbine combined-cycle penetration of industrial and utility applications has escalated rapidly due to the lower cost, higher efficiency and demonstrated reliability of gas turbine equipment in combination with fuel economics. Gas turbine technology growth has renewed the interest in the use of coal and other solid fuels in combined cycles for electrical and thermal energy production to provide environmentally acceptable plants without extra cost. Four different types of systems utilizing the gas turbine advantages with solid fuel have been studied: direct coal combustion, combustor processing, fuel processing and indirect cycles. One of these, fuel processing (exemplified by coal gasification), is emerging as the superior process for broad scale commercialization at this time. Advances in gas turbine design, proven in operation above 200 MW, are establishing new levels of combined-cycle net plant efficiencies up to 55% and providing the potential for a significant shift to gas turbine solid fuel power plant technology. These new efficiencies can mitigate the losses involved in gasifying coal and other solid fuels, and economically provide the superior environmental performance required today. Based on demonstration of high baseload reliability for large combined cycles (98%) and the success of several demonstrations of Integrated Gasification Combined Cycle (IGCC) plants in the utility size range, it is apparent that many commercial IGCC plants will be sites in the late 1990s. This paper discusses different gas turbine systems for solid fuels while profiling available IGCC systems. The paper traces the IGCC option as it moved from the demonstration phase to the commercial phase and should now with planned future improvements, penetrate the solid fuel power generation market at a rapid pace.

22983 (CONF-950801–4) **Impact of organic-mineral matter interactions on thermal reaction pathways for coal model compounds.** Buchanan, A.C. III (Oak Ridge National Lab., TN (United States). Chemical and Analytical Sciences Div.); Britt, P.F.; Struss, J.A. Oak Ridge National Lab., TN (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 210. national meeting of the American Chemical Society; Chicago, IL (United States); 20-25 Aug 1995. Order Number DE95014282. Source: OSTI; NTIS; GPO Dep.

Coal is a complex, heterogeneous solid that includes interdispersed mineral matter. However, knowledge of organic-mineral matter interactions is embryonic, and the impact of these interactions on coal pyrolysis and liquefaction is incomplete. Clay minerals, for example, are known to be effective catalysts for organic reactions. Furthermore, clays such as montmorillonite have been proposed to be key catalysts in the thermal alteration of lignin into vitrinite during the coalification process. Recent studies by Hatcher and coworkers on the evolution of coalified woods using microscopy and NMR have led them to propose selective, acid-catalyzed, solid state reaction chemistry to account for retained structural integrity in the wood. However, the chemical feasibility of such reactions in relevant solids is difficult to demonstrate. The authors have begun a model compound study to gain a better molecular level understanding of the effects in the solid state of organic-mineral matter interactions relevant to both coal formation and processing. To satisfy the need for model compounds that remain nonvolatile solids at temperatures ranging to 450 C, model compounds are employed that are chemically bound to the surface of a fumed silica (Si-O-C_{aryl} linkage). The organic structures currently under investigation are phenethyl phenyl ether ($C_6H_5CH_2CH_2OC_6H_5$) derivatives, which serve as models for β-alkyl aryl ether units that are present in lignin and lignitic coals. The solid-state chemistry of these materials at 200–450 C in the presence of interdispersed acid catalysts such as small particle size silica-aluminas and montmorillonite clay will be reported. Initial focus will be on defining the potential impact of these interactions on coal pyrolysis and liquefaction.

22984 (DOE/MC/27391–4057) **Scale-up of mild gasification to a process development unit. Progress report, November 21, 1994–February 20, 1995.** Doane, E.P.; Carty, R.H.; Foster, H. Kerr-McGee Coal Corp., Oklahoma City, OK (United States). Mar 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-92MC27391. Order Number DE95014923. Source: OSTI; NTIS; GPO Dep.

The overall objective of this project is to develop the IGT Mild-Gasification (MILDGAS) process for near-term commercialization. The specific objectives of the program are to: design, construct, and operate a 24-tons/day adiabatic process development unit (PDU) to obtain process performance data suitable for further design scaleup; obtain large batches of coal-derived co-products for industrial evaluation; prepare a detailed design of a demonstration unit; develop technical and economic plans for commercialization of the MILDGAS process. The project team that is performing the initial phases of the PDU development are: Kerr-McGee Coal Corporation (K-M Coal), the Institute of Gas Technology (IGT), Bechtel Corporation (Bechtel), and Southern Illinois University at Carbondale (SIUC). The MILDGAS process is a continuous closed system for producing liquid and solid (char) co-products at mild operating conditions up to 50 psig and 1300°F. It is capable of processing a wide range of both eastern caking and western noncaking coals. The 1 ton/hr PDU facility that is to be constructed is comprised of a 2.5-ft ID adiabatic gasifier for the production of gases, coal liquids, and char; a three-stage condensation train to condense and store the liquid products; and coal feeding and char handling equipment. The facility will also incorporate support equipment for environmentally acceptable disposal of process waste. This quarter, Roberts and Schaefer (R&S) of Salt Lake City, Utah was awarded the contract to perform the detailed design for the gasification, liquids recovery and overall plant design coordination. They began work in December of 1994 and a meeting was held between R&S, Bechtel, and IGT to discuss control methods, detailed equipment design, the heavy liquids filter, and possible modifications to the first and second stage cyclones.

22985 (DOE/METC/C–95/7185) **Innovative gasification technology for future power generation.** Mahajan, K. (Dept. of Energy, Morgantown, WV (United States)); Shadle, L.J.; Sadowski, R.S. USDOE Morgantown Energy Technology Center, WV (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). Ever tightening environmental regulations have changed the way utility and non-utility electric generation providers currently view their fuels choices. While coal is still, by far, the major fuel utilized in power production, the general trend over the past 20 years has been to switch to low-sulfur coal and/or make costly modifications to existing coal-fired facilities to reach environmental compliance. Unfortunately, this approach has led to fragmented solutions to balance our energy and environmental needs. To date, few integrated gasification combined-cycle (IGCC) suppliers have been able to compete with the cost of other more conventional technologies or fuels. One need only look at the complexity of many IGCC approaches to understand that unless a view toward IEC is adopted, the widespread application of such otherwise potentially attractive technologies will be unlikely in our lifetime. Jacobs-Sirrine Engineers and Riley Stoker Corporation are working in partnership with the Department of Energy's Morgantown Energy Technology Center to help demonstrate an innovative coal gasification technology called "PyGas™," for "pyrolysis-gasification". This hybrid variation of fluidized-bed and fixed-bed gasification technologies is being developed with the goal to efficiently produce clean gas at costs competitive with more conventional systems by incorporating many of the principles of IEC within the confines of a single-gasifier vessel. Our project is currently in the detailed design stage of a 4 ton-per-hour gasification facility to be built at the Fort Martin Station of Allegheny Power Services. By locating the test facility at an existing coal-fired plant, much of the facility infrastructure can be utilized saving significant costs. Successful demonstration of this technology at this new facility is a prerequisite to its commercialization.

22986 (DOE/PC/90011–T30) **Direct catalytic conversion of methane and light hydrocarbon gases. Final report, October 1, 1986–July 31, 1989.** Wilson, R.B. Jr.; Posin, B.M.; Chan, Yee-Wai. SRI International, Menlo Park, CA (United States). Jun 1995. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-86PC90011. Order Number DE95015620. Source: OSTI; NTIS; GPO Dep.

This project explored conversion of methane to useful products by two techniques that do not involve oxidative coupling. The first approach was direct catalytic dehydrocoupling of methane to give hydrocarbons and hydrogen. The second approach was oxidation of methane to methanol by using heterogenized versions of catalysts that were developed as homogeneous models of cytochrome-P450, an enzyme that actively hydroxylates hydrocarbons by using molecular oxygen. Two possibilities exist for dehydrocoupling of methane to higher hydrocarbons: The first, oxidative coupling to ethane/ethylene and water, is the subject of intense current interest. Nonoxidative coupling to higher hydrocarbons and hydrogen is endothermic, but in the absence of coke formation the theoretical thermodynamic equilibrium yield of hydrocarbons varies from 25% at 827°C to 65% at 1100°C (at atmospheric pressure). In this project we synthesized novel, highly dispersed metal catalysts by attaching metal clusters to inorganic supports. The second approach mimics microbial metabolism of methane to produce methanol. The methane mono-oxygenase enzyme responsible for the oxidation of methane to methanol in biological systems has exceptional selectivity and very good rates. Enzyme mimics are systems that function as the enzymes do but overcome the problems of slow rates and poor stability. Most of that effort has focused on mimics of cytochrome P-450, which is a very active selective oxidation enzyme and has a metalloporphyrin at the active site. The interest in nonporphyrin mimics coincides with the interest in methane mono-oxygenase, whose active site has been identified as a μ-oxo dinuclear iron complex.We employed mimics of cytochrome P-450, heterogenized to provide additional stability. The oxidation of methane with molecular oxygen was investigated in a fixed-bed, down-flow reactor with various anchored metal phthalocyanines (PC) and porphyrins (TPP) as the catalysts.

22987 (DOE/PC/90054–T13) **Novel nanodispersed coal liquefaction catalysts: Molecular design via microemulsion-based synthesis. Technical progress report, October–December 1993.** Boakye, E.; Radovic, L.R.; Osseo-Asare, K. Pennsylvania State Univ., University Park, PA (United States). Dept. of Materials Science and Engineering. Sep 1994. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90054. Order Number DE95014749. Source: OSTI; NTIS; GPO Dep.

Three different synthesis protocols were used to synthesize nanosize molybdenum sulfide particles in the microemulsion system polyoxyethylene(5)nonylphenyl ether (NP-5)/cyclohexane/water: (a) acid-solubilized microemulsion plus tetrathiomolybdate (ASMPT), (b) tetrathiomolybdate-solubilized microemulsion plus acid (TSMPA) and (c) microemulsion plus microemulsion (MPM), i.e., acid-solubilized microemulsion plus tetrathiomolybdate-solubilized microemulsion. The particle size was found to depend on the synthesis method, especially at water-to-surfactant molar ratios (R) greater than 2.5. At R=3.5-4.5, the average particle size increased according to the synthesis method in the order: ASMPT < MPM < TSMPA. Furthermore, for each synthesis protocol, the average particle diameter increased with the water-to-surfactant molar ratio (R). These trends are rationalized by considering: (a) the increase in the rate of exchange of materials between the inverse micelles as R is increased, and (b) the different effects of the electrolytes (i.e., sulfuric acid and ammonium tetrathiomolybdate plus sodium hydroxide) on microemulsion stability.

22988 (DOE/PC/90054–T17) **Novel nanodispersed coal liquefaction catalysts: Molecular design via microemulsion-based synthesis. Final technical report, October 1990–December 1994.** Osseo-Asare, K. (and others); Boakye, E.; Vittal, M. Pennsylvania State Univ., University Park, PA (United States). Coll. of Earth and Mineral Sciences. Apr 1995. 301p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90054. Order Number DE95015961. Source: OSTI; NTIS; GPO Dep.

This report described the synthesis of Molybdenum Sulfides in microemulsions by acidification of ammonium tetrathiomolybdate. Molybdenum Sulfides have been shown to be potential coal liquefaction catalysts. The importance of particle size, temperature effects, and coal surface chemistry to impregnation are discussed.

22989 (DOE/PC/91029–T7) **Refining and end use study of coal liquids. Sixth quarterly technical progress report, December 19, 1994–March 26, 1995.** Bechtel National, Inc., San Francisco, CA (United States). [1995]. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93PC91029. Order Number DE95015618. Source: OSTI; NTIS; GPO Dep.

Bechtel, with Southwest Research Institute, Amoco Oil R&D, and the M.W. Kellogg Co. as subcontractors, initiated a study on November 1, 1993, for the U.S. Department of Energy's (DOE's) Pittsburgh Energy Technology Center (PETC) to determine the most cost effective and suitable combination of existing petroleum refinery processes needed to make specification transportation fuels or blending stocks, from direct and indirect coal liquefaction product liquids. This 47-month study, with an approved budget of $4.4 million dollars, is being performed under DOE Contract Number DE-AC22-93PC91029. A key objective is to determine the most desirable ways of integrating coal liquefaction liquids into existing petroleum refineries to produce transportation fuels meeting current and future, e.g. year 2000, Clean Air Act Amendment (CAAA) standards. An integral part of the above objectives is to test the fuels or blends produced and compare them with established ASTM fuels. The comparison will include engine tests to ascertain compliance of the fuels produced with CAAA and other applicable fuel quality and performance standards. The final part of the project includes a detailed economic evaluation of the cost of processing the coal liquids to their optimum products. The cost analyses is for the incremental processing cost; in other words, the feed is priced at zero dollars. The study reflects costs for operations using state of the art refinery technology; no capital costs for building new refineries is considered. Some modifications to the existing refinery may be required. Economy of scale dictates the minimum amount of feedstock that should be processed.

22990 (DOE/PC/91058–T14) **Rate enhancement for catalytic upgrading coal naphthas. Final of final technical progress report, July 1991–September 1994.** Davis, B.H. Kentucky Univ., Lexington, KY (United States). Center for Applied Energy Research. [1995]. 210p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91058. Order Number DE95015623. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to remove sulfur, nitrogen, and oxygen from naphtha derived from coal liquefaction. The project is concerned with the development of hydrotreating catalysts. This period, a ruthenium sulfide catalyst has been studied.

22991 (DOE/PC/91304–T13) **Low severity upgrading of F-T waxes with solid superacids. Quarterly report, January 1995–March 1995.** Tierney, J.W.; Wender, I. Pittsburgh Univ., PA (United States). Dept. of Chemical and Petroleum Engineering. 6 Apr 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91304. Order Number DE95015605. Source: OSTI; NTIS; GPO Dep.

In this quarter we studied the effect of hydrogen pressure, and of sulfur and nitrogen containing compounds on the isomerization and hydrocracking of n-hexadecane using a $Pt/ZrO_2/SO_4$ catalyst. The reactions were carried out at 300°C and hydrogen pressures between 50 and 500 psig. Increasing hydrogen pressure resulted in increased conversion and increased hydrocracking. Nitrogen containing compounds had a greater inhibiting effect on the conversion of n-hexadecane than sulfur-containing compounds. The reaction of diphenylmethane in air at 25°C and in the presence of sulfated zirconia was studied as a possible means to characterize the protonic acidity of solid superacids.

22992 (DOE/PC/92108–T8) **Technology development for cobalt F-T catalysts. Quarterly technical progress report No. 8, July 1, 1994–September 30, 1994.** Singleton, A.H. Energy Research and Development International, Inc., Pittsburgh, PA (United States). 18 Apr 1995. 197p. Sponsored by USDOE, Washington,

DC (United States). DOE Contract AC22-92PC92108. Order Number DE95014321. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to investigate the influence of various promoters, additives, and supports on minimizing the methane selectivity and increasing the water-gas shift (WGS) activity of cobalt (Co) Fischer-Tropsch (F-T) catalysts. The ultimate goal of this investigation is to identify and demonstrate a catalyst preparation procedure that will be scaled up for the reproducible synthesis of commercial quantities of supported Co catalysts with desired activity, selectivity, and lifetime for use in F-T synthesis in three-phase slurry bubble column reactors. Accomplishments for this quarter are: Four new catalysts were formulated and prepared during this period under both subtasks 1.2 and 1.3 and five more catalysts were prepared by Calsicat; The characterization of all the catalysts in order to determine their physical properties (BET surface area, pore volume, pore size diameter, particle size distribution), as well as the cobalt reducibility, extent of reduction, and dispersion) was continued; Seven new catalysts have been tested for their F-T synthesis performance; An investigation of the effect of pre-treatment (i.e. calcination in static air versus flowing air, direct reduction without prior calcination) of a selected number of catalysts upon their performance for F-T synthesis was continued during this period.

22993 (DOE/PC/92109–T8) **Direct aromatization of methane. Quarterly technical progress report No. 9, October 1, 1994–December 31, 1994.** Altamira Instruments, Inc., Pittsburgh, PA (United States). 30 May 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92109. Order Number DE95015615. Source: OSTI; NTIS; GPO Dep.

Further experiments have been performed on the assisted pyrolysis by the addition of a free-radical initiator, as well as on the initiation of pyrolysis by a solid surface using a variety of catalysts. The reaction has been studied in the temperature range of 850-1100°C, methane flow rates of 475-1000 Scc/min, and ethane flow rates of 21-42 Scc/min. Significant reduction in the pyrolysis temperature was observed in both cases, with measurable amounts of methane being converted at temperatures as low as 850°C. When ethane was added as a free-radical initiator, the major pyrolysis products were ethylene and propylene at temperatures below 950°C. At higher pyrolysis temperatures, the selectivity shifted toward benzene and acetylene which became the main analyzable products at 1050°C and 1100°C.

22994 (DOE/PC/92119–T7) **Microbial recovery of metals from spent coal liquefaction catalysts. Final and quarterly report, July 1994–September 1994.** Sandbeck, K.A.; Cleveland, D. Geo-Microbial Technologies, Inc., Ochelata, OK (United States). [1995]. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92119. Order Number DE95015515. Source: OSTI; NTIS; GPO Dep.

Research is reported on the recovery of molybdenum and nickel from spent coal liquefaction catalysts. Mo release from spent coal liquefaction catalysts has been shown to be dependent upon many parameters, but release is dominated by microbial growth. The microbial Mo release is a rapid process requiring less than one week for 90% of the releaseable Mo to be solubilized from whole washed (THF) catalyst. It could be expected that the rates would be even greater with crushed catalyst. Efforts were centered on optimizing the parameters that stimulate microbial growth and action and further efforts centered on catalyst pre-treatment prior to microbial bio-leaching. Recent experiments suggest that hydrogen peroxide promises to be an effective pre-treatment wash. Hydrogen peroxide was also found to be an effective and economical agent for metals solubilization per se and could promote solubilization without subjecting the catalyst to microbial growth.

22995 (DOE/PC/92121–T9) **High conversion of coal to transportation fuels for the future with low HC gas production. Progress report Number 10, January 1–March 31, 1995.** Wiser, W.H.; Oblad, A.G. Utah Univ., Salt Lake City, UT (United States). Dept. of Chemical and Fuels Engineering. Apr 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92121. Order Number DE95015478. Source: OSTI; NTIS; GPO Dep.

An objective of the Department of Energy in funding research in coal liquefaction, is to produce a synthetic crude from coal at a cost lower than $30.00 per barrel (Task A). A second objective is to produce a fuel which is low in aromatics, yet of sufficiently high octane number for use in the gasoline-burning transportation vehicles of today. To meet this second objective, research was proposed for conversion of the highly-aromatic liquid product from coal conversion to a product high in isoparaffins, which compounds in the gasoline range exhibit a high octane number (Task B). Experimental coal liquefaction studies conducted in a batch microreactor have demonstrated potential for high conversions of coal to liquids with low yields of hydrocarbon (HC) gases, hence small consumption of hydrogen in the primary liquefaction step. Ratios of liquids/HC gases as high as 30/1, at liquid yields as high as 82% of the coal by weight, have been achieved. The principal objective of this work is to examine how nearly one may approach these results in a continuous-flow system, at a size sufficient to evaluate the process concept for production of transportation fuels from coal. A continuous-flow reactor system is to be designed, constructed and operated. The system is to be computer-operated for process control and data logging, and is to be fully instrumented. The primary liquid products will be characterized by GC, FTIR, and GC/MS, to determine the types and quantities of the principal components produced under conditions of high liquids production with high ratios of liquids/HC gases. From these analyses, together with GC analyses of the HC gases, hydrogen consumption for the conversion to primary liquids will be calculated. Conversion of the aromatics of this liquid product to isoparaffins will be investigated. Results to date on both tasks are presented.

22996 (DOE/PC/92529–T10) **Transient studies of low temperature catalysts for methane conversion. Quarterly technical progress report, January 1, 1995–March 31, 1995.** Notre Dame Univ., IN (United States). Dept. of Chemical Engineering. [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92529. Order Number DE95015604. Source: OSTI; NTIS; GPO Dep.

Previous results showed that a 3% Rh/TiO_2 catalyst was active during synthesis gas formation at temperatures significantly lower than those previously reported in the literature. In order to better understand the nature of the surface interactions between reacting gases and the catalyst surface, a series of transient experiments were conducted. The experiments consisted of pulses of methane and oxygen/methane mixtures diluted in helium carrier gas. In addition, temperature programmed desorption (TPD) studies were carried out on the fresh and used (post-run), Rh/TiO_2catalyst. The purpose of this study was to learn about the effect of the long residence time reaction on the surface activity of the catalyst. The objective of the pulse experiments was to determine the role of surface and lattice oxygen during methane activation process.

22997 (DOE/PC/93053–T3) **Cooperative Research Program in coal liquefaction. Technical report, May 1, 1994–October 31, 1994.** Consortium for Fossil Fuel Liquefaction Science, Lexington, KY (United States). [1994]. 227p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93PC93053. Order Number DE95016283. Source: OSTI; NTIS; GPO Dep.

Progress reports are presented for the following tasks: coliquefaction of coal with waste materials; catalysts for coal liquefaction to clean transportation fuels; fundamental research in coal liquefaction; and in situ analytical techniques for coal liquefaction and coal liquefaction catalysts.

22998 (DOE/PC/93069–4) **Development of precipitated iron Fischer-Tropsch catalysts. Quarterly technical progress report, 1 January 1995–31 March 1995.** Bukur, D.B.; Lang, X.; Reddy, B. Texas A and M Univ., College Station, TX (United States). Dept. of Chemical Engineering. 23 May 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-94PC93069. Order Number DE95016676. Source: OSTI; NTIS; GPO Dep.

During the reporting period we completed synthesis of about 100 g of catalyst with nominal composition 100 Fe/3 Cu/4 K/16 SiO_2 (S-3416-2), and of another batch (173 g) of the same catalyst (S-3416-3). Also, we synthesized two additional batches of catalyst with nominal composition 100 Fe/5 Cu/6 K/24 SiO_2, in the amounts of 240 g (S-5624-3) and 200 g (S-5624-4). These amounts are sufficient for all planned tests with these two catalysts for the entire

duration of this contract. The synthesized catalysts were characterized by atomic absorption, and BET surface area and pore size distribution measurements.

23000 (SAND–95-1124C) **Hydrotreating of coal-derived liquids.** Stohl, F.V.; Lott, S.E.; Diegert, K.V.; Goodnow, D.C.; Oelfke, J.B. Sandia National Labs., Albuquerque, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950801–3: 210. national meeting of the American Chemical Society, Chicago, IL (United States), 20-25 Aug 1995). Order Number DE95013034. Source: OSTI; NTIS; GPO Dep.

The objective of Sandia's refining of coal-derived liquids project is to determine the relationship between hydrotreating conditions and Product characteristics. The coal-derived liquids used in this work were produced in HTI's first proof-of-concept run using Illinois No. 8 coal. Samples of the whole coal liquid product, distillate fractions of this liquid, and Criterion HDN-60 catalyst were obtained from Southwest Research Inc. Hydrotreating experiments were performed using a continuous operation, unattended, microflow reactor system. A factorial experimental design with three variables (temperature, (310°C to 388°C), liquid hourly space velocity (1 to 3 g/h/cm^3(cat)), pressure (500 to 1000 psig H_2) is being used in this project. Sulfur and nitrogen contents of the hydrotreated products were monitored during the hydrotreating experiments to ensure that activity was lined out at each set of reaction conditions. Results of hydrotreating the whole coal liquid showed that nitrogen values in the products ranged from 549 ppM at 320°C, 3 g/h/cm^3(cat), 500 psig H_2 to <15 ppM at 400°C, 1 g/h/cm^3(cat), 1000 psig H_2.

23001 (DOE/PC/93220–T6) **Production of elemental sulfur and methane from H_2S and CO_2 derived from a coal desulfurization process. Quarterly technical progress report, January 1, 1995–March 31, 1995.** Jiang, X.; Khang, S.J. Cincinnati Univ., OH (United States). Dept. of Chemical Engineering. [1995]. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93220. Order Number DE95015616. Source: OSTI; NTIS; GPO Dep.

During the sixth quarter of the project, simulations were carried out to investigate the feasibility of producing elemental sulfur and methane from hydrogen sulfide and carbon dioxide by using the overall reaction of H_2S and CO_2 based on the following equation: $4\ H_2S + CO_2 = 2\ S_2 + CH_4 + 2\ H_2O$. The results indicate that two reaction zones are required to realize the above reaction. The first reaction zone should be composed of multiple stages to recover the elemental sulfur without the equilibrium limitations. With optimum temperatures in each zone, the conversion can be increased significantly. The simulation also indicates less amounts of by-products, such as COS, CS_2 and SO_2. The limitation on the extraction of sulfur is directly related to the sulfur vapor pressure.

23002 (DOE/PC/92104–T10) **Advanced thermally stable jet fuels. Technical progress report, April 1994–June 1994.** Schobert, H.H. (and others); Eser, S.; Song, C. Pennsylvania State Univ., University Park, PA (United States). Coll. of Earth and Mineral Sciences. Jul 1994. 103p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92104. Order Number DE95015516. Source: OSTI; NTIS; GPO Dep.

Research continued on coal-based, thermally stable, jet fuels. Significant progress has been made on the detection of polycyclic aromatic hydrocarbons present in highly stressed fuels, using high-performance liquid chromatography (HPLC) with diode-array detection. Gas chromatography is not able to detect compounds with $\geq$6 fused aromatic rings, but such compounds can be identified using the HPLC method. The concentration of such compounds is low in comparison to aromatics of 1-3 rings, but the role of the large compounds in the formation of solid deposits may be crucial in determining the thermal stability of a fuel. The unusual properties of fluid fuels in the near-critical region appear to have significant effects on their thermal decomposition reactions. This issue has been investigated in the present reporting period using n-tetradecane as a model compound for fuel decomposition. Temperature-programmed retention indices are very useful for gas chromatographic and gas chromatography/mass spectrometric analysis of coal and petroleum derived jet fuels. We have demonstrated this in the identification of components in two JP-8 fuels and their liquid chromatographic fractions. The role of activated carbon surfaces as catalysts in the thermal stressing of jet fuel was investigated using n-dodecane and n-octane as model compounds. In some cases the reactions were spiked with addition of 5% decalin to test the ability of the carbon to catalyze the transformation of decalin to naphthalene. We have previously shown that benzyl alcohol and 1,4-benzenedimethanol are effective stabilizers at temperatures $\geq$400°C for jet fuels and the model compound dodecane. The addition of ethanol to hydrocarbon/benzyl alcohol mixtures has a significant effect on the thermal stabilization of jet fuels above 400°C. Ethanol appears to function by reducing the benzaldehyde formed during the degradation of the benzyl alcohol. This reduction regenerates the benzyl alcohol.

23003 (DOE/PC/93202–6) **Molecular accessibility in oxidized and dried coals. Quarterly report, January 1995–March 1995.** Kispert, L.D. Alabama Univ., University, AL (United States). Dept. of Chemistry. Mar 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93202. Order Number DE95015510. Source: OSTI; NTIS; GPO Dep.

The objective of this research project is to determine the molecular and structural changes that occur in swelled coal as a result of oxidation and moisture loss both in the presence and absence of light using our newly developed EPR spin probe method. The proposed study will make it possible to deduce the molecular accessibility distribution in swelled, oxidized APCS coal for each rank as a function of (1) size (up to 6 nm) and shape, (2) the relative acidic/basic reactive site distributions, and (3) the role of hydrogen bonding as a function of swelling solvents. The advantage of the EPR method is that it permits molecules of selected shape, size and chemical reactivity to be used as probes of molecular accessible regions of swelled coal. From such data an optimum catalyst can be designed to convert oxidized coal into a more convenient form and methods can be devised to lessen the detrimental weathering processes.

Order Number DE95011613. Source: OSTI; NTIS; GPO Dep.

The In-Situ Forced Oxidation (IFO) process to produce gypsum in a commercial scale flue gas desulfurization (FGD) system was first demonstrated by GE Environmental Systems in 1980 at the Monticello Generating Station of Texas Utilities. Since then, the IFO technology developed and demonstrated by GE has become the industry standard and is used extensively on a world-wide basis to produce both commercial and disposable-grade gypsum. The paper gives an overview of the development, demonstration, commercial design and current status of the IFO technology.

23006 (CONF-941089–Vol.2, pp. 505-556) **ABB wet flue gas desulfurization.** Niijhawan, P. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 2.* 607p. The wet limestone process for flue gas desulfurization (FGD) is outlined. The following topics are discussed: wet flue gas desulfurization, wet FGD characteristics, wet scrubbers, ABB wet FGD experience, wet FGD forced oxidation, advanced limestone FGD systems, key design elements, open spray tower design, spray tower vs. packed tower, important performance parameters, SO_2 removal efficiency, influence by L/G, limestone utilization, wet FGD commercial database, particulate removal efficiencies, materials of construction, nozzle layout, spray nozzles, recycle pumps, mist elimination, horizontal flow demister, mist eliminator washing, reagent preparation system, spray tower FGDS power consumption, flue gas reheat options, byproduct conditioning system, and wet limestone system.

23007 (CONF-941089–Vol.2, pp. 557-567) **Two years of outstanding AFGD performance, pure air on the Lakes Bailly Scrubber Facility.** Henderson, J. (Pure Air, Allentown, PA (United States)); Vymazal, D.C.; Styf, D.A. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 2.* 607p. Order Number DE95011613. Source: OSTI; NTIS; GPO Dep.

The "Advanced Flue Gas Desulfurization (AFGD) Demonstration Project" is a $151.3 million cooperative effort between the U.S. Department of Energy and a project company of Pure Air, a general partnership of Air Products and Chemicals, Inc. and Mitsubishi Heavy Industries America, Inc. The goal of the AFGD project is to demonstrate that, by combining state-of-the-art technology, highly efficient plant operation and maintenance capabilities, and by-product gypsum sales, significant reductions of SO_2 emissions can be achieved at approximately one-half the life cycle of a conventional Flue Gas Desulfurization (FGD) system. Further, this emission reduction is achieved without generating solid waste and while minimizing liquid wastewater effluent. Briefly, this project entails the design, construction and operation of a nominal 600 MWe AFGD facility to remove SO_2 from coal-fired power plant flue gas at the Northern Indiana Public Service Company's Bailly Generating Station, located approximately 40 miles southeast of Chicago, Illinois. The facility is used to demonstrate a variety of advanced technical and business-related features, during a three-year period of operation which began in the summer of 1992. The aim of this demonstration is to accelerate near-term commercialization. Key features of the AFGD project are discussed. Construction of the scrubber is complete; operations began in June 1992, ahead of schedule and within budget. The Clean Coal demonstration project calls for three years of operations. After the three-year demonstration period, Pure Air on the Lake will continue to Own-and-Operate the scrubber for the next 17 years. This paper review the advanced wet flue gas desulfurization (FGD) design features, and the environmental and business features of the project. Also included are data on the first two years of successful operation.

23008 (CONF-941089–Vol.2, pp. 569-579) **Babcock & Wilcox technologies for power plant stack emissions control.** Polster, M. (Babcock & Wilcox, Barberton, OH (United States)); Nolan, P.S.; Batyko, R.J. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 2.* 607p. Order Number DE95011613. Source: OSTI; NTIS; GPO Dep.

The current status of sulfur dioxide control in power plants is reviewed with particular emphasis on proven, commercial technologies. This paper begins with a detailed review of Babcock & Wilcox commercial wet flue gas desulfurization (FGD) systems. This is followed by a brief discussion of B&W dry FGD technologies, as well as recent full-scale and pilot-scale demonstration projects which focus on lower capital cost alternatives to conventional FGD systems. A comparison of the economics of several of these processes is also presented. Finally, technology selections resulting from recent acid rain legislation in various countries are reviewed.

23009 (CONF-941089–Vol.2, pp. 581-591) **Design considerations for wet flue gas desulfurization systems - wet scrubber hardware issues.** Hurwitz, H. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 2.* 607p. Order Number DE95011613. Source: OSTI; NTIS; GPO Dep.

About 20 years ago the first wet flue gas desulfurization systems installed on coal fired utility boilers in the United States were experiencing extreme operating problems. In addition to their failure to achieve the necessary SO_2 removal efficiencies, these FGD systems required a major investment in maintenance, both material and labor, just to remain operational. These first generation systems demonstrated that a lack of understanding of the chemistry and operating conditions of wet flue gas desulfurization can lead to diastrous results. As the air pollution control industry developed, both in the United States and in Japan, a second generation of FGD systems was introduced. These designs incorporated major improvements in both system chemistry control and in the equipment utilized in the process. Indeed, the successful introduction of utility gas desulfurization systems in Germany was possible only through the transfer of the technology improvements developed in the US and in Japan. Today, technology has evolved to a third generation of wet flue gas desulfurication systems and these systems are now offered worldwide through a series of international licensing agreements. The rapid economic growth and development in Asia and the Pacific Rim combined with existing problems in ambient air quality in these same geographic areas, has resulted in the use of advanced air pollution control systems; including flue gas desulfurization both for new utility units and for many retrofit projects. To meet the requirements of the utility industry, FGD systems must meet high standards of reliability, operability and performance. Key components in achieving these objectives are: FGD System reliability/operability/performance; FGD system supplier qualifications; process design; equipment selection. This paper will discuss each of the essential factors with a concentration on the equipment selection and wet scrubber hardware issues.

23010 (CONF-941089–Vol.2, pp. 593-611) **Cost effective treatment for wet FGD scrubber bleedoff.** Janecek, K.F. (EIMCO Process Equipment Company, Salt Lake City, UT (United States)); Kim, J.Y. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From

US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 2.* 607p. Order Number DE95011613. Source: OSTI; NTIS; GPO Dep.

The dewatering of scrubber bleedoff gypsum is a thoroughly proven technology, whether for production of wallboard grade gypsum or environmentally responsible land fill. Careful review of the technology options will show which one is the most effective for the specific plant site. Likewise, a recipe for wastewater treatment for heavy metals removal can be found that will meet local regulatory limits. EIMCO has worldwide experience in FGD gypsum sludge dewatering and wastewater treatment. Contacting EIMCO can be the most important step toward a practical cost effective system for handling FGD scrubber bleed slurries.

23011 (CONF-941089–Vol.2, pp. 613-620) **Milliken Station Demonstration Project FDG retrofit update.** Alder, R.C. (and others); Jackson, C.E.; O'Dea, D.T. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 2.* 607p. Order Number DE95011613. Source: OSTI; NTIS; GPO Dep.

The Milliken Clean Coal Demonstration Project is one of the nine Clean Coal Projects selected for funding in Round 4 of the U.S. DOE's Clean Coal Demonstration Program. The project's sponsor is New York State Electric and Gas Corporation (NYSEG). Project team members include CONSOL Inc., Saarberg-Holter-Umwelttechnik (SHU), NALCO/FuelTech, Stebbins Engineering and Manufacturing Co., DHR Technologies, and CE Air Preheater. Gilbert/Commonwealth is the Architect/Engineer and Construction Manager for the flue gas desulfurization (FGD) retrofit. The project will provide full-scale demonstration of a combination of innovative emission-reducing technologies and plant upgraded for the control of sulfur dioxide (SO_2) and nitrogen oxides (NO_x) emissions from a coal-fired steam generator without a significant loss of station efficiency. The overall project goals are the following: 98% SO_2 removal efficiency using limestone while burning high sulfur coal; up to 70% NO_x reduction using the NOXOUT selective non-catalytic reduction (SNCR) technology in conjunction with combustion modifications; minimization of solid waste by producing marketable by-products including commercial grade gypsum, calcium chloride, and fly ash; zero wastewater discharge; maintenance of station efficiency by using a high efficiency heat-pipe air heater system and a low-power-consuming scrubber system. The demonstration project is being conducted at NYSEG's Milliken Station, located in Lansing, New York. Milliken Station has two 150-MWe pulverized coal-fired units built in the 1950s by Combustion Engineering. The SHU FGD process and the combustion modifications are being installed on both units, but the NOXOUT process, Plant Economic Optimization Advisor (PEOA), and the high-efficiency air heater system will be installed on only one unit.

23012 (CONF-941089–Vol.2, pp. 675-692) **Emission and thermal performance upgrade through advanced control backfit.** Banerjee, A.K. (Stone & Webster Engineering Corporation, Boston, MA (United States)). USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 2.* 607p. Order Number DE95011613. Source: OSTI; NTIS; GPO Dep.

Reducing emission and improving thermal performance of currently operating power plants is a high priority. A majority of these power plants are over 20 years old with old control systems. Upgrading the existing control systems with the latest technology has many benefits, the most cost beneficial are the reduction of emission and improving thermal performance. The payback period is usually less than two years. Virginia Power is installing Stone & Webster's NO_x Emissions Advisor and Advanced Steam Temperature Control systems on Possum Point Units 3 and 4 to achieve near term NO_x reductions while maintaining high thermal performance. Testing has demonstrated NO_x reductions of greater than 20 percent through the application of NO_x Emissions Advisor on these units. The Advanced Steam Temperature Control system which has been operational at Virginia Power's Mt. Storm Unit 1 has demonstrated a signification improvement in unit thermal performance and controllability. These control systems are being combined at Units 3 and 4 to reduce NO_x emissions and achieve improved unit thermal performance and control response with the existing combustion hardware. Installation has been initiated and is expected to be completed by the spring of 1995. Possum Point Power Station Units 3 and 4 are pulverized coal, tangentially fired boilers producing 107 and 232 MW and have a distributed control system and a PC based performance monitoring system. The installation of the advanced control and automation system will utilize existing control equipment requiring the addition of several PCs and PLC.

23013 (DOE/MC/25140–4053) **Power systems development facility. Quarterly technical progress report, July 1, 1994–September 30, 1994.** Southern Co. Services, Inc., Birmingham, AL (United States). [1995]. 133p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-90MC25140. Order Number DE95014479. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to evaluate hot gas particle control technologies using coal-derived gas streams. This will entail the design, construction, installation, and use of a flexible test facility which can operate under realistic gasification and combustion conditions. The major particulate control device issues to be addressed include the integration of the particulate control devices into coal utilization systems, on-line cleaning techniques, chemical and thermal degradation of components, fatigue or structural failures, blinding, collection efficiency as a function of particle size, and scale-up of particulate control systems to commercial size. The conceptual design of the facility was extended to include a within scope, phased expansion of the existing Hot Gas Cleanup Test Facility Cooperative Agreement to also address systems integration issues of hot particulate removal in advanced coal-based power generation systems. This expansion included the consideration of the following modules at the test facility in addition to the original Transport Reactor gas source and Hot Gas Cleanup Units: (1) Carbonizer/Pressurized Circulating Fluidized Bed Gas Source. (2) Hot Gas Cleanup Units to mate to all gas streams. (3) Combustion Gas Turbine. (4) Fuel Cell and associated gas treatment. This expansion to the Hot Gas Cleanup Test Facility is herein referred to as the Power Systems Development Facility (PSDF).

23014 (DOE/MC/26042–4059) **Advanced particle filter. Technical progress report No. 19, January 1995–March 1995.** American Electric Power Service Corp., Columbus, OH (United States). [1995]. 73p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-89MC26042. Order Number DE95015514. Source: OSTI; NTIS; GPO Dep.

Tidd advanced particle filtration (APF) test runs 25 through 34 were completed during the first quarter of 1995. All Tidd testing was completed with the conclusion of APF test run 34 on 3/30/95. The Westinghouse activities supporting the APF operation during this quarter included processing of test data and participating in one APF borescope inspection. Data is included on the filter operation.

23015 (DOE/MC/26288–4060) **Sonic enhanced ash agglomeration and sulfur capture. Technical progress report, January 1995–March 1995.** Manufacturing and Technology Conversion International, Inc., Columbia, MD (United States). [1995]. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-89MC26288. Order Number DE95014947. Source: OSTI; NTIS; GPO Dep.

This program is focused on the process for bimodal ash agglomeration and simultaneous sulfur capture for the development of coal fired combustion gas turbines. The process also accommodates injection of alkali gettering materials. During this period, further dismantling of the existing bimodal test unit was performed. The design of a revised process development unit and hot gas cleanup unit have been completed.

23016 (DOE/MC/28162–4015) **Coolside waste management research. Quarterly report, October 1994–December 1994.** Kentucky Univ., Lexington, KY (United States). Center for Applied

Energy Research. Feb 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-91MC28162. Order Number DE95000085. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to investigate chemical, mineralogical, and physical changes in Coolside waste materials to determine suitability for environmentally safe disposal. A compilation of the field lysimeter leachate data from the lowest leachate transport tubes indicates a major shift in the solution mineral equilibria regime. The pH of the L3 lysimeter (~12.2) and elemental concentrations in the leachates is grossly different from L2 and L1 (e.g., pH ~10.5). Sulfate averaged to date ~10,000 to 12,000 ppm in L1 and L2 compared to ~1,700 ppm in L3. As the materials have the same composition, the preconditioning regime of the materials appears to have a major influence on the leachate chemistry. Soil gas measurements have now been completed for most of a growing season. $C0_2$ concentrations as high as >26,000 pm were found in the soil gas. The distribution of the gas in the soil indicates that the FGD material is a major sink for the gas and that carbonation reactions are a major force in the geochemical regime for these materials.

23017 (DOE/MC/30251–4068) **High-volume, high-value usage of flue gas desulfurization (FGD) by-products in underground mines. Quarterly report, October–December 1994.** Kentucky Univ., Lexington, KY (United States). Center for Applied Energy Research. Mar 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-93MC30251. Order Number DE95009714. Source: OSTI; NTIS; GPO Dep.

Research under Subtask 2.2, Chemical and Mineralogical Characterization, included further refinement of mineralogical transformation and the initiation of a kinetic study. The expansion of the FGD materials during moisturizing is attributable to three reactions: the hydration of portlandite to slaked lime; the formation of ettringite from fly ash and anhydrite, and; the formation of gypsum from anhydrite. The sequence of these reactions are being examined in a kinetic study. Completion of the first 15 days of study finds the steady decrease in anhydrite with concomitant formation of ettringite (on fly ash surfaces) and gypsum (pore and crack in-fillings). Geotechnical characterization (Subtask 2.3) focused on swell experiments which will model in situ emplacement. Specimens of FGD material have been stored in 3-inch diameter pipe and, after 39 days, 0.5% of axial swell has been recorded with material strengths of 600 to 1,000 psi. Experiments to determine the amount of moisture loss due to the heat of hydration indicate about 9 to 10% of the water is lost. Confined swell tests are also underway with pressures of 15 to 20 psi recorded at 25 days. Work performed under Task 4 (Background for Phase 11) included determination of the compressive strengths for the experimental mine roof rock. Values in the 5,000 to 7,500 psi range were found, which is typical for this type of strata in the region. Work on the hydrologic monitoring program (Subtask 4.2) included completion of the hydraulic conductivity assessment of the strata, as well as completion of the monitoring well plan. The highest hydraulic conductivity was found for the Princes No. 3 coal seam with values of $1x10^{-3}$ feet/min. The weathered sandstone over the coal had conductivities in the 10^{-4} to 10^{-5} feet/min range.

23018 (DOE/MC/30252–4077) **Management of dry flue gas desulfurization by-products in underground mines. Quarterly report, January–March 1995.** Chugh, Y. (and others); Dutta, D.; Esling, S. Southern Illinois Univ., Carbondale, IL (United States). Dept. of Mining Engineering. Apr 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-93MC30252. Order Number DE95009723. Source: OSTI; NTIS; GPO Dep.

On September 30, 1993, the U.S. Department of Energy, Morgantown Energy Technology Center and Southern Illinois University at Carbondale (SIUC) entered into a cooperative research agreement entitled "Management of Dry Flue Gas Desulfurization By-Products in Underground Mines" (DE-FC21-93MC 30252). Under the agreement Southern Illinois University at Carbondale will develop and demonstrate several technologies for the placement of coal combustion residues in abandoned coal mines, and will assess the environmental impact of such underground residues placement. Previous quarterly Technical Progress Reports have set forth the specific objectives of the program, as well as the management plan and the test plan for the overall program, and a discussion of these will not be repeated here. Rather, this report, will set forth the technical progress made during the period January 1 through March 31, 1995. The demonstration of the SEEC, Inc. technology for the transporting of coal combustion residues was completed with the unloading and final disposition of the three Collapsible Intermodal Containers (CIC). The loading and transport by rail of the three CIC's was quire successful; however some difficulties were encountered in the unloading of the containers. A full topical report on the entire SEEC demonstration is being prepared. As a result of the demonstration some modifications of the SEEC concept may be undertaken. Also during the quarter the location of the injection wells at the Peabody No. 10 mine demonstration site were selected. Peabody Coal Company has developed the specifications for the wells and sought bids for the actual drilling. It is expected that the wells will be drilled early in May.

23019 (DOE/PC/91344–T12) **Advanced separation technology for flue gas cleanup. Quarterly technical report No. 11, October 1994–December 1994.** Bhown, A.S. (and others); Alvarado, D.; Pakala, N. SRI International, Menlo Park, CA (United States). Dec 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC91344. Order Number DE95014989. Source: OSTI; NTIS; GPO Dep.

The objective of this work is to develop a novel system for regenerable SO_2 and NO_x scrubbing of flue gas that focuses on (a) a novel method for regeneration of spent SO_2 scrubbing liquor and (b) novel chemistry for reversible absorption of NO_x. In addition, high efficiency hollow fiber contactors (HFC) are proposed as the devices for scrubbing the SO_2 and NO_x from the flue gas. The system will be designed to remove more than 95% of the SO_x and more than 75% of the NO_x from flue gases typical of pulverized coal-fired power plants at a cost that is at least 20% less than combined wet limestone scrubbing of SO_x and selective catalytic reduction of NO_x. In addition, the process will make only marketable byproducts, if any (no waste streams). The major cost item in existing technology is capital investment. Therefore, our approach is to reduce the capital cost by using high efficiency hollow fiber devices for absorbing and desorbing the SO_2 and NO_x. We will also introduce new process chemistry to minimize traditionally well-known problems with SO_2 and NO_x absorption and desorption. For example, we will extract the SO_2 from the aqueous scrubbing liquor into an oligomer of dimethylaniline to avoid the problem of organic liquid losses in the regeneration of the organic liquid.

0109 Environmental Aspects

This paper presents the environmental impacts decursive of utilization of South-Brazilian mineral coal to generation of electric energy. This environmental impacts and alternatives of attenuating measures are presented and evaluated, containing the totality of productive cycle: mining, processing, transport, stock piling and use in thermoelectric power plants. Environmental procedures are systematized for first time, in order to be observed in whole expansion of coal thermoelectric generator park. The conception of power plants and site studies of their useful lives are also included. (C.M.). 19 figs, 24 tabs.

23021 (NEDO-C–9201) **Subsidies for promotion of coal production/utilization technology. First Clean Coal Technology Conference.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1993. 127p. (In Japanese). Order Number DE95790774. Source: OSTI; NTIS; Available from New

Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

This is a proceedings of the first Clean Coal Technology (CCT) Conference. The conference was held among scholars/men of experience, coal-related organizations, and the competent authorities to discuss NEDO's role such as CCT-related international cooperation, technology development, and system arrangement for technology transfer. In 1992, the CCT Center was established. What the center is conscious of as its subject are NEDO's overseas cooperation in CCT, how to promote clean coal utilization as technology including energy-saving generally, and how to image the future coal industry. As reference for discussion, data were distributed on transfer of the coal policy viewed from a coal utilization aspect, a system diagram for classification of the coal-related technology, a table of the coal-related technology system, the present status and development of CCT in NEDO, international cooperation through CCT. Since it is indispensable to depend on coal with the increasing energy demand in developing countries, a lot of discussions were made on coal handling, sulfur content, the CO2 problem, improvement of combustion efficiency, construction of model plants, etc.

23022 (NEDO-C–9332) **Feasibility study on the environment harmony type coal utilization system. Feasibility study on the environment harmony type coal utilization system in the coal industry sector for China.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Jun 1994. 127p. (In Japanese). Order Number DE95790787. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

Coal engineers were sent to China, and field surveys/seminars were conducted and advice was provided to them on technologies of combustion, environment and coal briquette. In China, they already know the knowledge of environmental technology of Japan, however it is necessary for them to develop inexpensive technology because of their financial difficulties. For treatment of flue gas, a water-curtain type dust arrester is installed, and the dust is at an approximately 100-150 mg/m^3 level. PH treatment is hardly given to the waste water. It is better to use this dust arrester for flue gas desulfurization and to remodel it to the one having functions of desulfurization and dust collecting. In the cogeneration plant, its main purpose is heat supply and its operational rate is low. It is desirable to take measures for promotion of energy saving such as adoption of a bleeder turbine and a system for purchase of electricity. In the heat supply, heat loss is enormous. It seems that the low fuel cost retards improvement of energy efficiency. As to coal briquette technology, they are very eager to widely spread briquette compounded with desulfurizing agent, and are interested in the high-pressure briquetting machine of Japan. 34 figs.

23023 (ETDE-DE–143) **Environmentally friendly flexible drive concept for hard coal mining. Final report.** Schlichter (comp.); Jung (comp.). Saarbergwerke AG, Saarbruecken (Germany). Produktbereich Zentrale Dienste. Oct 1991. 21p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0326659A. Order Number DE95791352. Source: OSTI; NTIS (US Sales Only).

In the period from 1.3.89 to 30.6.91, Saarbergwerke AG in collaboration with the firm of MMBT were to test in working conditions and evaluate economically the drive components protected against an explosive atmosphere, consisting of two permanent magnet motors and associated power electronics, as a double motor drive on a cable railway machine. An inherently safe control permitted for use underground was to be developed for initiating and monitoring the drive and its braking device, and to measure the operating conditions and monitor the railway track, and this was to be adapted for the 2 motor drive above ground. Finally, the drive and control units were to be tested and optimized in two years' use. The accompanying technical measurements of the experimental use by the DMT Company for Research and Testing GmbH were to supply the basis for assessing the alternative drive concept. (orig.)

The report provides up-to-date information on the German coal mining industry for the reporting time period. Data on coal mining as well as on brown coal mining cover: Production, stocks, productivity, employees, sales, imports and exports of coal and coal products. (HS)

0130 Transport, Handling, and Storage

23025 (DOE/PC/91297–T10) **A computational model for coal transport and combustion. Final technical report.** Ahmadi, G. Clarkson Univ., Potsdam, NY (United States). Mar 1995. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91297. Order Number DE95016287. Source: OSTI; NTIS; GPO Dep.

In this project, a comprehensive theoretical, computational and experimental study directed toward providing a fundamental understanding of particulate flows as applied to coal transport is performed. Thermodynamically admissible constitutive expressions for the phasic stress tensors, heat and fluctuation energy flux vectors for turbulent multiphase flows were derived. The material parameters of the model were evaluated from the limiting conditions of rapid flows of dry spherical granular particles, and single-phase turbulent fluid flows. The case of simple shear flows of glass beads-water mixtures was studied. The model was extended to cover chemically active gas-solid flows. A thermodynamically consistent model for rapid flows of granular materials in a rotating frame of reference, along with a transport equation for the granular kinetic stress tensor was developed. The model parameters for the special case of spherical nearly elastic particles were evaluated. The results for the granular stresses and the normal stress differences were compared with the available simulation data and good agreement was observed. Effects of frictional loss of energy on rapid granular shear flows were studied. The previously developed kinetic based model was used and the mean velocity, the fluctuation kinetic energy and the solid volume fraction profiles were evaluated under a variety of conditions and different friction coefficients. A computational model for analyzing rapid granular in complex geometries was developed. The discrete element scheme was used and the granular flow down a chute was analyzed. The results were compared with the available experimental data, the model predictions, and the existing simulation results, and good agreements were observed. The model was used to analyze granular flows in a duct with an obstructing block. The effect of boundary condition was also included and the granular gravity flow was analyzed in details.

23026 (DOE/PC/92578–T8) **Coal log pipeline research at the University of Missouri. 1st Quarterly report for 1995, January 1, 1995–March 31, 1995.** Liu, H. Missouri Univ., Columbia, MO (United States). [1995]. 122p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93PC92578. Order Number DE95015611. Source: OSTI; NTIS; GPO Dep.

Work continued on the study of coal log pipeline research. Individual projects described include fast compaction of coal logs; effect of cooling on coal log quality; coal log capping; effectiveness of adding fiber to enhance coal log quality; fabrication using hydrophobic binders; cost estimation of different lubricants; automatic control of coal log pipeline system; CLP design; coal log train transport; economics of coal log pipeline; legal aspects; heating, cooling, and drying of logs; vacuum systems to enhance production; design; and effect of piston modification on capping.

Global power generation markets have shown a steady penetration of GT/CC technology into oil and gas fired applications as the technology has matured. The lower cost, improved reliability and efficiency advantages of combined cycles can now be used to improve the cost of electricity and environmental acceptance of poor quality fuels such as coal, heavy oil, petroleum coke and waste products. Four different technologies have been proposed, including slagging combustors, Pressurized Fluidized Bed Combustion (PFBC), Externally Fired Combined Cycle (EFCC) and Integrated Gasification Combined Cycle (IGCC). Details of the technology for the three experimental technologies can be found in the appendix. IGCC is now a commercial technology. In the global marketplace, this shift is being demonstrated using various gasification technologies to produce a clean fuel for the combined cycle. Early plants in the 1980s demonstrated the technical/environmental features and suitability for power generation plants. Economics, however, were disappointing until the model F GT technologies were first used commercially in 1990. The economic break-through of matching F technology gas turbines with gasification was not apparent until 1993 when a number of projects were ordered for commercial operation in the mid-1990s. GE has started 10 new projects for operation before the year 2000. These applications utilize seven different gasification technologies to meet specific application needs. Early plants are utilizing low-cost fuels, such as heavy oil or petroleum coke, to provide economics in first-of-a-kind plants. Some special funding incentives have broadened the applications to include power-only coal plants. Next generation gas turbines projected for commercial applications after the year 2000 will contribute to another step change in technology. It is expected that the initial commercialization process will provide the basis for clear technology choices on future plants.

23028 (DOE/MC/21023–4008-Vol.1) **Second generation pressurized fluidized-bed combustion (PFBC) research and development, Phase 2 – Task 4, carbonizer testing. Volume 1, Test results.** Froehlich, R.; Robertson, A.; Vanhook, J.; Goyal, A.; Rehmat, A.; Newby, R. Foster Wheeler Development Corp., Livingston, NJ (United States). Nov 1994. 334p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-86MC21023. Order Number DE95000080. Source: OSTI; NTIS; GPO Dep.

During the period beginning November 1991 and ending September 1992, a series of tests were conducted at Foster Wheeler Development Corporation in a fluidized-bed coal carbonizer to determine its performance characteristics. The carbonizer was operated for 533 hours in a jetting fluidized-bed configuration during which 36 set points (steady-state periods) were achieved. Extensive data were collected on the feed and product stream compositions, heating values, temperatures, and flow rates. With these data, elemental and energy balances were computed to evaluate and confirm accuracy of the data. The carbonizer data were not as self-consistent as could be desired (balance closure imperfection). A software package developed by Science Ventures, Inc., of California, called BALAID, was used to reconcile the carbonizer data; the details of the reconciliation have been given in Volume 1 of this report. The reconciled data for the carbonizer were rigorously analyzed, correlations were developed, and the model was updated accordingly. The model was then used in simulating each of the 36 steady-state periods achieved in the pilot plant. The details are given in this Volume of the report.

23030 (DOE/MC/27229–4055) **Pulsed atmospheric fluidized bed combustion. Technical progress report, January 1995–April 1995.** Thermochem, Inc., Columbia, MD (United States). 31 May 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-90MC27229. Order Number DE95014976. Source: OSTI; NTIS; GPO Dep.

Progress is reported on the design of a pulsed fluidized bed combustor and component, fabrication, and construction site activities.

23031 (DOE/PC/79650–T48) **CWS-fired residential warm-air heating system. Quarterly report, January 22, 1987–April 30, 1987.** Becker, F.E.; Smolensky, L.A.; McPeak, M.A. Thermo Electron Corp., Waltham, MA (United States). May 1987. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-87PC79650. Order Number DE95015542. Source: OSTI; NTIS; GPO Dep.

The objective of this project is the development of a coal water slurry burning residential furnace. A literature survey has been performed. Also, the preliminary testing of prototype components was carried out. Design criteria and specifications are discussed.

23032 (DOE/PC/79903–T19-Vol.1) **Optical properties of fly ash. Volume 1, Final report.** Self, S.A. Stanford Univ., CA (United States). High Temperature Gasdynamics Lab. Dec 1994. 299p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-87PC79903. Order Number DE95016152. Source: OSTI; NTIS; GPO Dep.

Research performed under this contract was divided into four tasks under the following headings: Task 1, Characterization of fly ash; Task 2, Measurements of the optical constants of slags; Task 3, Calculations of the radiant properties of fly ash dispersions; and Task 4, Measurements of the radiant properties of fly ash dispersions. Tasks 1 and 4 constituted the Ph.D. research topic of Sarbajit Ghosal, while Tasks 2 and 3 constituted the Ph.D. research topic of Jon Ebert. Together their doctoral dissertations give a complete account of the work performed. This final report, issued in two volumes consists of an executive summary of the whole program followed by the dissertation of Ghosal. Volume 1 contains the dissertation of Ghosal which covers the characterization of fly ash and the measurements of the radiant properties of fly ash dispersions. A list of publications and conference presentations resulting from the work is also included.

23033 (DOE/PC/79903–T19-Vol.2) **Optical properties of fly ash. Volume 2, Final report.** Self, S.A. Stanford Univ., CA (United States). High Temperature Gasdynamics Lab. Dec 1994. 293p.

23034 (DOE/PC/88697–T11) **Coal-water slurry fuel combustion testing in an oil-fired industrial boiler. Semiannual technical progress report, August 15, 1994–February 15, 1995.** Miller, B.G. Pennsylvania State Univ., University Park, PA (United States). Energy and Fuels Research Center. 12 May 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-89PC88697. Order Number DE95015608. Source: OSTI; NTIS; GPO Dep.

The Pennsylvania State University is conducting a coal-water slurry fuel (CWSF) program for the United States Department of Energy (DOE) and the Commonwealth of Pennsylvania with the objective of determining the viability of firing CWSF in an industrial boiler designed for heavy fuel oil. Penn State and DOE have entered into a cooperative agreement to determine if CWSFs prepared from cleaned coal (containing approximately 3.5 wt.% ash and 0.9 wt.% sulfur) can be burned effectively in a heavy fuel oil-designed industrial boiler without adverse impact on boiler rating, maintainability, reliability, and availability. The project will also provide information to help in the design of new systems specifically configured to fire these clean coal-based fuels. The project consists of four phases: (1) design, permitting, and test planning, (2) construction and start up, (3) demonstration and evaluation (1,000-hour demonstration), and (4) expanded demonstration and evaluation (installing a CWSF preparation circuit, conducting an additional 1,000 hours of testing, and installing an advanced flue gas treatment system). The boiler testing and evaluation will determine if the CWSF combustion characteristics, heat release rate, fouling and stagging behavior, corrosion and erosion tendencies, and fuel transport, storage, and handling characteristics can be accommodated in a boiler system designed to fire heavy fuel oil. In addition, the proof-of-concept demonstration will generate data to determine how the properties of a CWSF and its parent coal affect boiler performance. The economic factors associated with retrofitting boilers will also be evaluated. The first three phases (i.e., the first demonstration) have been completed and the combustion performance of the burner that was provided with the boiler did not meet performance goals. Consequently, the first demonstration has been concluded at 500 hours.

23035 (DOE/PC/90278–T1) **Development of a coal fired pulse combustor for residential space heating. Technical progress report, October–December 1986.** Management and Technical Consultants, Inc., Columbia, MD (United States). [1986]. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-86PC90278. Order Number DE95016147. Source: OSTI; NTIS; GPO Dep.

This progress report presents a detailed description of the background, technology and application, and Statement of Work for the development of a coal-fired pulse combustor for residential space heating.

23036 (DOE/PC/90278–T2) **Development of a coal fired pulse combustor for residential space heating. Technical progress report, January–March 1987.** Management and Technical Consultants, Inc., Columbia, MD (United States). [1987]. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-86PC90278. Order Number DE95016146. Source: OSTI; NTIS; GPO Dep.

The systematic development of the residential combustion system is divided into three phases. Only Phases I and II are detailed here. Phase I constitutes the design, fabrication, testing, and evaluation of a pulse combustor sized for residential space heating. Phase II is an optional phase to develop an integrated system including a heat exchanger. Phase III is projected as a field test of the integrated coal-fired residential space heater. The program logic is depicted in Figure 3-1. The objective of Phase I is to develop an ' advanced pulse coal combustor at the 100,000 Btu/hr scale which can later be integrated with a heat exchanger and controls to form a residential space heater. Phase I is comprised of four technical tasks which are described. The initial test fuels for the Phase I and II effort were expected to be coal slurries. However, it soon became obvious that the availability of the slurries during the development stage would be somewhat problematic and could become an impediment to maintaining progress and schedule. It was therefore decided, after discussions with the DOE Project Manager, to focus the Phase I and II effort upon the use of dry micronized coal and to consider the slurries for a product improvement activity in later phases of the program. This change will not affect the cost, schedule, or technical objectives of the Statement of Work.

23037 (DOE/PC/90278–T3) **Development of a coal fired pulse combustor for residential space heating. Technical progress report, April–June 1987.** Management and Technical Consultants, Inc., Columbia, MD (United States). [1987]. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-86PC90278. Order Number DE95016145. Source: OSTI; NTIS; GPO Dep.

During this period, advanced chambers were fabricated and tested in both single and tandem configurations. A scrubber was designed, constructed, installed in the facility, and checked-out. The dry pulverized coal and micronized coal water mixtures have been supplied by Energy International. Optimization of the configuration continued with respect to fuel phasing, slag handling characteristics, and tailpipe coupling.

23038 (DOE/PC/90278–T4) **Development of a coal fired pulse combustor for residential space heating. Technical progress report, July–September 1987.** Management and Technical Consultants, Inc., Columbia, MD (United States). [1987]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-86PC90278. Order Number DE95016144. Source: OSTI; NTIS; GPO Dep.

The systematic development of the residential combustion system is divided into three phases. Only Phase I is detailed here. Phase I constitutes the design, fabrication, testing, and evaluation of a pulse combustor sized for residential space heating. Phase II is an optional phase to develop an integrated system including a heat exchanger. Phase III is projected as a field test of the integrated coal-fired residential space heater. The Phase I effort was nearing completion during this reporting period and a final report is in preparation. The configuration testing was completed early in the period and based upon results of the configuration tests, an optimized configuration for the experimental development testing was chosen. The refractory-lined chambers were fabricated and tested from mid-September through early October. The tandem unit was operated on dry micronized coal without support gas or excitation air for periods lasting from one to three hours. Performance was stable and turndown ratios of 3:1 were achieved during the first three-hour test. A early commercial residential heating system configuration has been identified on the basis of the development testing conducted throughout the first phase of this effort. The development effort indicates that the residential unit goals are achievable with some additional product improvement effort to increase carbon burn-out efficiency, reduce CO emissions and develop a reliable and compact dry, ultrafine coal feed system (not included in the present effort).

23039 (DOE/PC/90278–T5) **Development of a coal fired pulse combustor for residential space heating: Phase 1-A. Technical progress report, June–August 1988.** Management and Technical Consultants, Inc., Columbia, MD (United States). Oct 1988. 37p. Sponsored by USDOE, Washington, DC (United

States). DOE Contract AC22-86PC90278. Order Number DE95016143. Source: OSTI; NTIS; GPO Dep.

The systematic development of the residential combustion system is divided into three phases. Only Phases I and IA are detailed here. Phase I constitutes the design, fabrication, testing, and evaluation of a pulse combustor sized for residential space heating. Phase IA includes additional testing with coal-water slurries and the design and evaluation of integrated systems using dry micronized coal and slurry. Phase II is an optional phase to develop an integrated system including a heat exchanger. Phase III is projected as a field test of the integrated coal-fired residential space heater. During this period, a combustor test bed was designed and fabricated to provide experimental resolution for the primary technical issues necessary to design and fabricate a fully integrated and optimized unit. A preliminary integrated design was also prepared and analytic models developed to simulate both steady-state performance and transient response during start-up and periodic cycling. The combustor test bed, ancillary facility components (including the wet cyclone scrubber), and sampling train were installed. Shakedown tests of the test bed were also initiated and a test plan is being prepared.

23040 (DOE/PC/92159–T12) **Engineering development of advanced coal-fired low-emission boiler systems. Technical progress report No. 10, January 1995–March 1995.** Combustion Engineering, Inc., Windsor, CT (United States). Power Plant Labs. 17 May 1995. 118p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92159. Order Number DE95015619. Source: OSTI; NTIS; GPO Dep.

The project is on schedule and under budget. The current status is shown in the Milestone Schedule Report included as Appendix A. All Project Plans were updated based on the revised finding level authorized for FY95 and anticipated for FY96. Technology Transfer activities included "supplying" three executives and several team members to the LEBS Workshop, delivering a technical paper at a conference, and working on a Combustion 2000 Session for another conference. ABBES and CeraMem reached agreement concerning Task 7 work, including ownership and disposition of project-purchased equipment to be used during Task 7 and also during Task 11. A test plan was prepared. Task 7 activities for the Low-NO_x Firing System included computational modeling of the firing arrangement. Reasonable comparisons to experimental data previously obtained in the Boiler Simulation Facility were achieved. A kinetic evaluation for both baseline and low NO_x firing arrangements was also performed, with results indicating that the final reducing zone within the main windbox has a dominant effect on NO_x reduction, with higher temperatures being more favorable for lower NO_x. A week of combustion testing was completed in the Fundamental Scale Burner Facility to examine the impact of integrated fuel staging (NO_x reduction via the reburn mechanism), and to explore preliminary vertical staging concepts within the main windbox region. Preliminary results from this testing demonstrated the potential of vertical air staging within the main windbox to augment overfire air. Testing was performed to quantify the coal size distribution and power requirements for one (1) conventional static and four (4) dynamic classifier designs. Results from this testing show the dynamic classifier capable of producing finer grinds of coal at lower relative power requirements.

23041 (DOE/PC/94116–T4) **Emissions reductions in coal-fired home heating stoves through use of briquettes. Quarterly report, January 1, 1995–March 31, 1995.** Acurex Environmental Corp., Research Triangle Park, NC (United States). 27 Apr 1995. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-94PC94116. Order Number DE95015609. Source: OSTI; NTIS; GPO Dep.

The purpose of this program is to encourage the formation of commercial ventures between the U.S. and Polish firms to provide equipment and /or services to reduce pollution from low emission sources in Krakow, Poland. This period has seen additional briquette testing at Akademia Gorniczo Hutnicza (AGH). In addition, Euromining has begun large-scale briquette production. The initial multi-ton batches were delivered as this period ended. Acurex Environmental Corporation has delivered a sampling crew and equipment to Krakow. Testing at INCO Veritas (INCO) has not started due to delays in the delivery of briquettes by Euromining but is expected to begin with the new quarter. Arrangements are in place for the product market testing to begin as soon as the briquettes are available.

23042 (DOE/PC/94122–T2) **Combustion characterization of coal fines recovered from the handling plant. Quarterly technical progress report No. 2, January 1, 1995–March 31, 1995.** Houshang, Masudi. Prairie View A and M Univ., TX (United States). Apr 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94PC94122. Order Number DE95015536. Source: OSTI; NTIS; GPO Dep.

The main goal of this research project is to evaluate the combustion characteristics of the slurry fuels prepared from the recovered coal fines and plant coal fines. A specific study will include the combustion behavior, flame stability, ash behavior and emissions of SO_x, NO_x and particulate in a well insulated laboratory scale furnace in which the residence time and temperature history of the burning particles are similar to that of utility boiler furnace at 750,000 Btu/hr input and 20% excess air. The slurry fuel will be prepared at 60% solid to match the generic slurry properties, i.e., viscosity less than 500 cp, 100% of particles passing through 100 mesh and 80-90% of solid particles passing through 200 mesh. The coal blend is prepared using a mix of 15% effluent recovered coal and 85% plant fines. Combustion characteristics of the slurry fuels is determined at three different firing rates 750K, 625K, 500K Btu/hr. Finally a comparison of the results is made to determine the advantages of coal water slurry fuel over the plant coal blended form.

23043 (SAND–95-8234) **The release of iron during coal combustion. Milestone report.** Baxter, L.L. (Sandia National Labs., Livermore, CA (United States). Combustion Research Facility). Sandia National Labs., Livermore, CA (United States). Jun 1995. 88p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95015267. Source: OSTI; NTIS; GPO Dep.

Iron plays an important role in the formation of both fly ash and deposits in many pulverized-coal-fired boilers. Several authors indicate that iron content is a significant indicator of the slagging propensity of a majority of US bituminous coals, in particular eastern bituminous coals. The pyritic iron content of these coals is shown to be a particularly relevant consideration. A series of investigations of iron release during combustion is reported for a suite of coals ranging in rank from lignite to low-volatile bituminous coal under combustion conditions ranging from oxidizing to inert. Experimental measurements are described in which, under selected conditions, major fractions of the iron in the coal are released within a 25 ms period immediately following coal devolatilization. Mechanistic interpretation of the data suggest that the iron is released as a consequence of oxygen attack on porous pyrrhotite particles. Experimental testing of the proposed mechanism reveals that the release is dependent on the presence of both pyrite in the raw coal and oxygen in the gas phase, that slow preoxidation (weathering) of the pyrite significantly inhibits the iron release, and that iron loss increases as oxygen penetration of the particle increases. Each observation is consistent with the postulated mechanism.

23044 (SAND–95-8250) **Coal char fragmentation during pulverized coal combustion.** Baxter, L.L. Sandia National Labs., Albuquerque, NM (United States). Jul 1995. 68p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95015841. Source: OSTI; NTIS; GPO Dep.

A series of investigations of coal and char fragmentation during pulverized coal combustion is reported for a suite of coals ranging in rank from lignite to low-volatile (lv) bituminous coal under combustion conditions similar to those found in commercial-scale boilers. Experimental measurements are described that utilize identical particle sizing characteristics to determine initial and final size distributions. Mechanistic interpretation of the data suggest that coal fragmentation is an insignificant event and that char fragmentation is controlled by char structure. Chars forming cenospheres fragment more extensively than solid chars. Among the chars that fragment, large particles produce more fine material than small particles. In all cases, coal and char fragmentation are seen to be

sufficiently minor as to be relatively insignificant factors influencing fly ash size distribution, particle loading, and char burnout.

23045 (SAND–95-8251) **Coal combustion science. Quarterly progress report, April 1994–June 1994.** Hardesty, D.R. (ed.); Baxter, L.L.; Davis, K.A. Sandia National Labs., Albuquerque, NM (United States). Jul 1995. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95015842. Source: OSTI; NTIS; GPO Dep.

Research on coal combustion continued. This report presents results on: kinetics and mechanisms of coal char combustion, and deposit growth and property development in coal-fired furnaces.

23046 (SAND–95-8252) **Release of inorganic material during coal devolatilization. Milestone report.** Baxter, L.L. Sandia National Labs., Albuquerque, NM (United States). Jul 1995. 74p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95015843. Source: OSTI; NTIS; GPO Dep.

Experimental results presented in this paper indicate that coal devolatilization products convectively remove a fraction of the nonvolatile components of inorganic material atomically dispersed in the coal matrix. Results from three facilities burning six different coals illustrate this mechanism of ash transformation and release from coal particles. Titanium is chosen to illustrate this type of mass release from coal particles on the basis of its low volatility and mode of occurrence in the coal. During moderate rates of devolatilization (10^4 K/s heating rate), no significant loss of titanium is noted. At more rapid rates of heating/devolatilization (10^5 K/s) a consistent but minor (3-4 %) loss of titanium is noted. During rapid devolatilization ($5x10^5$ K/s and higher), significant (10-20 %) amounts of titanium leave the coal. The loss of titanium monitored in coals ranging in rank from subbituminous to high-volatile bituminous coals and under conditions typical of pulverized-coal combustion. The amount of titanium lost during devolatilization exhibits a complex rank dependence. These results imply that other atomically dispersed material (alkali and alkaline earth elements) may undergo similar mechanisms of transformation and release.

23047 (ETDE-BR–0017) **Planning the mineral coal supply in Brazil: the MOCAM model and its applications.** Tourinho, Octavio A.F.; Margulis, Sergio; Ardeo, Vagner Laerte. Instituto de Planejamento Economico e Social (IPES), Rio de Janeiro, RJ (Brazil). Inst. de Pesquisas. Mar 1985. 272p. (In Portugese). Order Number DE95789961. Source: OSTI; NTIS (US Sales Only).

Serie textos para discussao. Grupo de energia no. 29.

The cost of Brazilian mineral coal for consumption is the result of factors related to several aspects of mining, processing and transport alternatives. A planning model to evaluate these alternatives is developed, including the activities of coal flux called MOCAM (Mineral Coal Model). This study shows how the MOCAM can be used as an instrument for planning, giving examples for the analysis of some political questions. The characterization of the three factors (mining, processing and transport) on the coal supply is described, discussing the qualitative aspects for planning and the main technical and economical parameters used in this modelling. An evaluation of the environmental problems in coal production and consumption and the present state of environment in Brazil, concerning the mineral coal are also presented. Finally some political questions about mineral coal supply, mentioning the economy of the transport and analysing the solution in relation to the demand and the fuel oil price are cited. 76 refs, 37 figs, 66 tabs

Final report.** Piekarski, C. Ruhrkohle AG, Essen (Germany). Jan 1995. 181p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 01HD010. Order Number DE95790758. Source: OSTI; NTIS (US Sales Only).

The "SEPIA" project (system for epidemiological analyses in occupational medicine) was developed by the company physicians of Ruhrkohle AG in cooperation with the institute of ergonomics. It represents a uniform procedure for medical checks in the black-coal mining sector in accordance with the plan of the superior board of mines of North-Rhine-Westphalia, which has been adopted by all members of the medical services of Ruhrgas. At each of these consulting rooms, data obtained by occupational-medical checks are systematically compiled and stored for a long time; epidemiologically relevant data material is gathered and evaluated. 23050 (DOE/BC/14649–8) **Analysis and evaluation of interwell seismic logging techniques for reservoir characterization. [Quarterly report], April 1–June 30, 1992.** Parra, J.O. Southwest Research Inst., San Antonio, TX (United States). [1992]. 86p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90BC14649. Order Number DE95015485. Source: OSTI; NTIS; GPO Dep.

The objective of this three-year research program is to investigate interwell seismic logging techniques for indirectly interpreting oil and gas reservoir geology and pore fluid permeability. This work involves a balanced study of advanced theoretical and numerical modeling of seismic waves transmitted between pairs of reservoir wells combined with experimental data acquisition and processing of measurements at controlled sites as well as in full-scale reservoirs. This reservoir probing concept is, aimed at demonstrating unprecedented high-resolution measurements and detailed interpretation of heterogeneous hydrocarbon-bearing formations. Part of the numerical model task is to investigate the sensitivity of the in-situ rock-physical properties of the formation such as porosity and permeability on three-component seismograms, and the pressure, as well as phase velocity and attenuation. For this purpose we have developed software to simulate synthetic seismograins associated with a point-source (compressional wave), and a point force (shear wave), in stratified fluid-filled porous media. In addition, we have developed software to calculate phase velocity and attenuation from interwell seismic waveforms. To demonstrate the use of these capabilities we present examples to simulate seismograms and dispersion and attenuation curves.

The objective of this three-year research program is to investigate interwell seismic logging techniques for indirectly interpreting oil and gas reservoir geology and pore fluid permeability. This work involves a balanced study of advanced theoretical and numerical modeling of seismic waves transmitted between pairs of reservoir

wells combined with experimental data acquisition and processing of measurements at controlled sites as well as in full-scale reservoirs. This reservoir probing concept is aimed at demonstrating unprecedented high-resolution measurements and detailed interpretation of heterogeneous hydrocarbon-bearing formations. Progress reports are presented by Task 3 conduct full-scale experimental field test and Task 4 data processing studies. For Task 3, interwell seismic experiments were conducted in the month of September at the University of Oklahoma Gypsy test site which is located in Pawnee County, Oklahoma. During the field test a full suite of interwell seismic data were acquired and will be used to extract rock porosity and permeability. In particular, interwell seismic experiments were conducted using two borehole hydrophone arrays (streamers) consisting of twelve detector channels (i.e., simultaneous source-to-detector measurements were made in two boreholes pairs having different separation distances) for source-independent seismic attenuation and dispersion studies.

Michigan Technological Univ., Houghton, MI (United States). 5 Apr 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93BC14892. Order Number DE95014956. Source: OSTI; NTIS; GPO Dep.

This report describes the development of a Spatial Database Manager (SDBM) shell/interface which will provide information to users on how to collect, store, analyze, interpret, visualize and present data in an integrated reservoir characterization study. SDBM will provide access to various geologic, reservoir visual data via a well log interpretation program (Crocker Petrolog), mapping and cross section software (the GeoGraphix Exploration System Workbench) and a volume visualization application. Data tables for geochemical and petrographic data, well logs, well header information, well production data, formation tops, and fault trace data have been completed. Spectral mineral data are currently being collected which will ultimately be used for identification of mineral assemblages. The geochemical program CHILLER is being used to model fluid-rock interactions and possibly porosity predictions.

23056 (DOE/BC/14896–6) **Geological and petrophysical characterization of the Ferron Sandstone for 3-D simulation of a fluvial-deltaic reservoir. Annual report, September 29, 1993–September 29, 1994.** Allison, M. Utah Dept. of Natural Resources, Salt Lake City, UT (United States). Geological Survey Div. Jul 1995. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93BC14896. Order Number DE95000172. Source: OSTI; NTIS; GPO Dep.

The objective of the Ferron Sandstone project is to develop a comprehensive, interdisciplinary, quantitative characterization of a fluvial-deltaic reservoir to allow realistic inter-well and reservoir-scale models to be developed for improved oil-field development in similar reservoirs world-wide. Quantitative geological and petrophysical information on the Cretaceous Ferron Sandstone in east-central Utah will be collected. Both new and existing data will be integrated into a three-dimensional model of spatial variations in porosity, storativity, and tensorial rock permeability at a scale appropriate for inter-well to regional-scale reservoir simulation. Simulation results could improve reservoir management through proper infill and extension drilling strategies, reduction of economic risks, increased recovery from existing oil fields, and more reliable reserve calculations. Transfer of the project results to the petroleum industry is an integral component of the project. This report covers research activities for fiscal year 1993-94, the first year of the project. Most work consisted of developing field methods and collecting large quantities of existing and new data. We also developed preliminary regional and case-study area interpretations. The project is divided into four tasks: (1) regional stratigraphic analysis, (2) case studies, (3) development of reservoirs models, and (4) field-scale evaluation of exploration strategies.

23057 (DOE/BC/14896–7) **Geological and petrophysical characterization of the Ferron Sandstone for 3-D simulation of a fluvial-deltaic reservoir. Technical progress report, January 1, 1995–March 31, 1995.** Allison, M.L. Utah Dept. of Natural Resources, Salt Lake City, UT (United States). Geological Survey Div. 2 May 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93BC14896. Order Number DE95014952. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to develop a comprehensive, interdisciplinary, and quantitative characterization of a fluvial-deltaic reservoir which will allow realistic inter-well and reservoir-scale modeling to be developed for improved oil-field development in similar reservoirs world-wide. The geological and petrophysical properties of the Cretaceous Ferron Sandstone in east-central Utah will be quantitatively determined. Both new and existing data will be integrated into a three-dimensional representation of spatial variations in porosity, storativity, and tensorial rock permeability at a scale appropriate for inter-well to regional-scale reservoir simulation. Results could improve reservoir management through proper infill and extension drilling strategies, reduction of economic risks,

increased recovery from existing oil fields, and more reliable reserve calculations. Transfer of the project results to the petroleum industry is an integral component of the project.

23058 (DOE/BC/14953–10) **Increased oil production and reserves from improved completion techniques in the Bluebell Field, Uinta Basin, Utah. Annual report, September 30, 1993–September 30, 1994.** Allison, M. Utah Dept. of Natural Resources, Salt Lake City, UT (United States). Geological Survey Div. Jul 1995. 123p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14953. Order Number DE95000171. Source: OSTI; NTIS; GPO Dep.

The Bluebell field produces from the Tertiary lower Green River and Wasatch Formations of the Uinta Basin, Utah. The productive interval consists of thousands of feet of interbedded fractured clastic and carbonate beds deposited in a fluvial-dominated deltaic lacustrine environment, sandstones deposited in fluvial-dominated deltas; and carbonates and some interbedded sandstones of the lower Wasatch transition deposited in mud flats. Bluebell project personnel are studying ways to improve completion techniques used in the field to increase primary production in both new wells and recompletions. The study includes detailed petrographic examination of the different lithologic reservoir types in both the outcrop and core. Outcrop, core, and geophysical logs are being used to identify and map important depositional cycles. Petrographic detail will be used to improve log calculation methods which are currently highly questionable due to varying water chemistry and clay content in the Green River and Wasatch Formations. Field mapping of fractures and their relationship to basin tectonics helps predict the orientation of open fractures in the subsurface. The project includes acquiring bore-hole imaging logs from new wells in the Bluebell field thereby obtaining detailed subsurface fracture data previously not available. Reservoir simulation models are being constructed to improve the understanding of pressure and fluid flow within the reservoir. A detailed database of well completion histories has been compiled and will be studied to determine which were the most and the least effective methods used in the past.

23059 (DOE/BC/14954–5) **Advanced secondary recovery demonstration for the Sooner Unit. Annual report, October 1992–May 1993.** Sippel, M. (and others); Junkin, J.; Pritchett, R. Diversified Operating Corp., Denver, CO (United States). Jul 1995. 160p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14954. Order Number DE95000170. Source: OSTI; NTIS; GPO Dep.

The objectives of this project are to demonstrate the effectiveness of a multi-diciplinary approach to targeted infill drilling and improved reservoir management. The first phase involves geophysical, geological, and engineering data acquisition and analysis to identify optimum well sites and to develop a reservoir operations plan. This report summarizes activities concerned with phase I of the Sooner Unit Project.

23060 (DOE/BC/14959–13) **Revitalizing a mature oil play: Strategies for finding and producing unrecovered oil in Frio Fluvial-Deltaic Sandstone Reservoirs of South Texas.** McRae, L.E.; Holtz, M.H.; Knox, P.R. Texas Univ., Austin, TX (United States). Jul 1995. 155p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14959. Order Number DE95000160. Source: OSTI; NTIS; GPO Dep.

The Frio Fluvial-Deltaic Sandstone Play of South Texas is one example of a mature play where reservoirs are being abandoned at high rates, potentially leaving behind significant unrecovered resources in untapped and incompletely drained reservoirs. Nearly 1 billion barrels of oil have been produced from Frio reservoirs since the 1940's, yet more than 1.6 BSTB of unrecovered mobile oil is estimated to remain in the play. Frio reservoirs of the South Texas Gulf Coast are being studied to better characterize interwell stratigraphic heterogeneity in fluvial-deltaic depositional systems and determine controls on locations and volumes of unrecovered oil. Engineering data from fields throughout the play trend were evaluated to characterize variability exhibited by these heterogeneous reservoirs and were used as the basis for resource calculations to demonstrate a large additional oil potential remaining within the play. Study areas within two separate fields have been selected in which to apply advanced reservoir characterization techniques. Stratigraphic log correlations, reservoir mapping, core analyses, and evaluation of production data from each field study area have been used to characterize reservoir variability present within a single field. Differences in sandstone depositional styles and production behavior were assessed to identify zones with significant stratigraphic heterogeneity and a high potential for containing unproduced oil. Detailed studies of selected reservoir zones within these two fields are currently in progress.

23061 (DOE/BC/14961–7) **Department of Energy quarterly technical report.** Anderson, R.N. Columbia Univ., Palisades, NY (United States). Lamont-Doherty Earth Observatory. 15 Apr 1995. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14961. Order Number DE95016212. Source: OSTI; NTIS; GPO Dep.

The objective is to test the concept that the growth faults in Eugene Island Block 330 (EI-330 field) are conduits through which producing reservoirs are charged and that enhanced production can be developed by producing directly from the fault zone. The site, operated by Penzoil, is located in 250 feet of water and the productive depth intervals include 4000 to 9000 feet. The field demonstration will be accomplished by drilling and production testing of growth fault systems associated with the EI-330 field. The project utilizes advanced 3-D seismic analysis, geochemical studies, structural and stratigraphic reservoir characterization, reservoir simulation, compact visualization systems. In this quarterly report, progress reports are presented for the following tasks: database management; reservoir characterization; modeling; geochemistry; and data integration.

23062 (DOE/BC/14982–3) **An integrated study of the Grayburg/San Andres Reservoir, Foster and South Cowden Fields, Ector County, Texas. Quarterly technical progress report No. 3, February 1, 1995–April 30, 1995.** Reeves, J.J.; Rowland, D.A.; Trentham, R.C. Laguna Petroleum Corp., Midland, TX (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-94BC14982. Order Number DE95016213. Source: OSTI; NTIS; GPO Dep.

The objective of this study is to demonstrate a methodology for reservoir characterization of shallow shelf carbonate reservoirs which is feasible for the independent operator. Furthermore, it will provide one of the first public demonstrations of the enhancement of reservoir characterization using high resolution 3-D seismic data. This particular project will evaluate the Grayburg and San Andres reservoirs in the Foster and South Cowden Fields of Ector County, Texas. We intend to showcase a multi-disciplinary approach to waterflood design and implementation, along with the addition of reserves by selective infill drilling. We believe this approach in reservoir development will be applicable to a wide range of shallow shelf carbonate reservoirs throughout the United States. Technology transfer will take place through all phases of the project. Progress reports are presented for the following tasks: geological; reservoir engineering; and geophysics.

23063 (DOE/BC–95000151) **Multifrequency crosshole EM imaging for reservoir characterization. FY 1994 annual report.** Lee, K.H. Lawrence Berkeley Lab., CA (United States). Jun 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95000151. Source: OSTI; NTIS; GPO Dep.

Electrical conductivity of sedimentary rocks is controlled by the porosity, hydraulic permeability, temperature, saturation, and the pore fluid conductivity. These rock parameters play important roles in the development and production of hydrocarbon (petroleum and natural gas) resources. For these reasons, resistivity well logs have long been used by geologists and reservoir engineers in petroleum industries to map variations in pore fluid, to distinguish between rock types, and to determine completion intervals in wells. Reservoir simulation and process monitoring rely heavily on the physical characteristics of the reservoir model. Over a period of three years (1991-1993) there was an initial phase of crosshole EM technique development via an informal partnership between LLNL and LBL. Researchers developed field instrumentation to apply to oil field for monitoring EOR thermal processes. Specifically, a prototype single-frequency instrumentation was developed and with this system we have conducted field surveys in four separate

locations. Theory and software were developed to interpret these data by providing subsurface images of the electrical conductivity. In spite of our initial success in developing practical EM techniques, we still had severe instrumentation limitations and shortcomings in interpretation for other than simple structures. The field equipment was designed to work only at a single frequency at a time and the transmitter must be opened to change frequencies. The equipment was also significantly noiser at higher frequencies. For high-resolution applications we need to take full advantage of the resolution inherent in the data. The development of a high-resolution subsurface conductivity imaging methods would have benefits far beyond the petroleum application. Such techniques would be very useful in environmental applications, mineral and geothermal exploration and for civil engineering applications.

23064 (DOE/BC–95000152) **Electrical and electromagnetic methods for reservoir description and process monitoring. Annual report, October 1, 1992–September 30, 1993.** Morrison, H.F.; Lee, K.H.; Becker, A. Lawrence Berkeley Lab., CA (United States). Jul 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95000152. Source: OSTI; NTIS; GPO Dep.

It is well known that electrical conductivity of rock is closely related to the porosity, hydrologic permeability, saturation, and the type of fluid in it. These rock parameters play important roles in the development and production of hydrocarbon (petroleum and natural gas) resources. For these reasons, resistivity well logs have long been used by geologists and reservoir engineers in petroleum industries to map variations in pore fluid, to distinguish between rock types, and to determine completion intervals in wells. Reservoir simulation and process monitoring rely heavily on the physical characteristics of the reservoir model. At the beginning of FY-91 a coordinated electrical and electromagnetic (EM) geophysical research program for petroleum reservoir characterization and process monitoring was initiated. Parties involved in this program include Lawrence Berkeley Laboratory (LBL), Lawrence Livermore Laboratory (LLNL), Sandia National Laboratory (SNL), and University of California at Berkeley (UCB). The overall objectives of the program were: to integrate research funded by DOE for hydrocarbon recovery into a focused effort to demonstrate the technology in the shortest time with the least cost; to assure industry acceptance of the technology developed by having industry involvement in the planning, implementation, and funding of the research; to focus the research on real world problems that have the potential for solution in the near term with significant energy payoff. Specific research activities conducted have been in the following areas: (1) EM modeling development; (2) data interpretation methods development; (3) hardware and instrumentation development; (4) EOR and reservoir characterization; (5) controlled field experiments. The primary focus of these activities was in the development of reliable inversion and imaging schemes that could yield conductivity distributions from measured electrical and EM field data.

23065 (DOE/BC–95000153) **Electrical and electromagnetic methods for reservoir description and process monitoring. Annual report, October 1, 1991–September 30, 1992.** Morrison, H.F.; Lee, Ki Ha; Becker, A. California Univ., Berkeley, CA (United States). Lawrence Berkeley Lab. Jul 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95000153. Source: OSTI; NTIS; GPO Dep.

During FY-91 a coordinated electrical and electromagnetic (em) geophysical research program for petroleum reservoir characterization and process monitoring was initiated. Parties involved in this program include Lawrence Berkeley Laboratory (LBL), Lawrence Livermore Laboratory (LLNL), Sandia National Laboratory (SNL), and University of California at Berkeley (UCB). The overall objectives of the program are: To integrate research funded by DOE for hydrocarbon recovery into a focused effort to demonstrate the technology in the shortest time with the least cost. To assure industry acceptance of the technology developed by having industry involvement in the planning, implementation, and funding of the research. To focus the research on real world problems that have the potential for solution in the near term with significant energy payoff. Specific research activities conducted through this integrated effort have been in the following five general areas: em modeling development; data interpretation methods development; hardware and instrumentation development; EOR and reservoir characterization; and controlled field experiments. At LBL/UCB research has been focused on activities (1), (2), and (5) in FY92. The primary focus of these activities is in the development of reliable inversion and imaging schemes that can yield conductivity distributions from measured electrical and em field data. The development of accurate forward modeling algorithms and the high-quality scale model experiment are necessarily the early part of the field experiment design and the inversion scheme development for ultimately monitoring the front tracking in existing reservoirs. Technical progress for the following activities are summarized in this report: tim-domain electromagnetic (TEM) scale model; inversion and imaging of em data; and controlled field experiments.

23066 (DOE/ER/14084–4) **Reservoir characterization by cross-hole seismic imaging. Final report, September 15, 1989–June 30, 1994.** Turpening, R.M.; Matarese, J.R.; Toksoez, M.N. Massachusetts Inst. of Tech., Cambridge, MA (United States). Earth Resources Lab. Jul 1995. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER14084. Order Number DE95016149. Source: OSTI; NTIS; GPO Dep.

Better characterization of reservoirs requires better images of those reservoirs. This report documents the research undertaken at the Massachusetts Institute of Technology's Earth Resources Laboratory (ERL) to improve seismic tomographic images. In addition, the new imaging method was applied to a data set collected in a producing oil field. The method developed is nonlinear travel time tomography. This technique uses the travel time of the first arriving energy at a receiver and distributes that time back along realistic ray paths. This is an important distinction between this method and previous methods that used either straight ray paths from source to receiver or fixed ray paths (ray paths fixed by an a priori model). The nonlinearity arises during each iteration in the matching of observed travel times with those determined from a model. In this technique the model is updated during each iteration (the velocity structure is changed) and new ray paths are computed in that update model. Thus the resulting image is based on physically realistic ray paths. Tomography resolution is not merely a simple function of the wavelength of the seismic energy used but also involves a measure of how well a given region has been sampled by ray paths. Moreover, the ray paths must represent a wide variation in inclination as they pass through a given spatial cell. This imaging technique was applied to a compressional wave data set collected at ERL's Michigan Test Site located in the Northern Reef Trend of MI. It consists of two deep boreholes that straddle a producing reef. Two hundred source positions and two hundred receiver positions were used to obtain 40,000 ray paths. Although ERL's boreholes are 2,000 ft apart, kilohertz data was obtained. The resulting image of the reservoir showed a low velocity zone inside the reef and a thin layer of low velocity that intersected one of the boreholes. The presence of this thin layer was confirmed by logs and borehole engineering.

23067 (SAND–95-0222C) **Origin, diagnostics, and mitigation of a salt dissolution sinkhole at the US Strategic Petroleum Reserve storage site, Weeks Island, Louisiana.** Neal, J.T. (Sandia National Labs., Albuquerque, NM (United States)); Myers, R.E. Sandia National Labs., Albuquerque, NM (United States). 27 Jan 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951098–1: 5. international symposium on land subsidence, The Hague (Netherlands), 16-20 Oct 1995). Order Number DE95008505. Source: OSTI; NTIS; GPO Dep.

A sinkhole was first observed in May 1992 over the edge of the two-level former salt mine that was converted for oil storage by the US Strategic Petroleum Reserve (SPR). Diagnostic studies that included geophysical, geochemical, drilling, and hydrological methods suggest a direct connection exists between the surface collapse area and the underground mine as shown by correlative measurements of sediment slump rates and brine influx into the mine. The dissolution of salt below the sinkhole that initiated the leak into the mine was likely caused by several confluent geologic

processes, and exacerbated by mining-induced stresses that created fractures which served as hydrologic flowpaths. Modeling studies of mine stresses show that years may be required before tensional cracking begins to occur, but once begun can continue to develop, and relieve the stress in that specific regime. The crack regime creates the avenue for incursion of groundwater, very slowly initially, but gradually enlarging as undersaturated groundwater dissolves salt on the sides of the crack. Mitigation measures include increasing the mine pressurization, slowing the dissolution by injecting brine into the sinkhole throat, and freeze grouting to restrict hydrologic flowpaths.

23068 (ANL/EA/CP–83975) **Synthetic drilling muds: Environmental gain deserves regulatory recognition.** Burke, C.J.; Veil, J.A. Argonne National Lab., Washington, DC (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950333–3: 2. SPE/EPA exploration and production environmental conference: government and industry working together to find cost effective approaches to protecting the environment, Houston, TX (United States), 27-29 Mar 1995). Order Number DE95012279. Source: OSTI; NTIS; GPO Dep.

Efficient drilling technology is essential to meet the needs of the oil industry. Both the challenges of new oil provinces, especially in offshore waters, and the demands for efficient environmental protection have driven the development of new technology. Drilling mud is a key factor influencing drilling technology use in modern drilling operations. New oil industry developments involve directional and horizontal drilling as well as drilling in frontier areas at greater and greater depths. Such capabilities and conditions demand careful attention to the selection and engineering of efficient mud systems.

23069 (BNL–60119) **Effects of selected thermophilic microorganisms on crude oils at elevated temperatures and pressures. Final report.** Premuzic, E.T.; Lin, M.S. Brookhaven National Lab., Upton, NY (United States). Jul 1995. 174p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95000159. Source: OSTI; NTIS; GPO Dep.

During the past several years, a considerable amount of work has been carried out showing that microbially enhanced oil recovery (MEOR) is promising and the resulting biotechnology may be deliverable. At the Brookhaven National Laboratory (BNL), systematic studies have been conducted which dealt with the effects of thermophilic and thermoadapted bacteria on the chemical and physical properties of selected types of crude oils at elevated temperatures and pressures. Particular attention was paid to heavy crude oils from Venezuela, California, Alabama, Arkansas, Wyoming, Alaska, and other oil producing areas. Current studies indicate that during the biotreatment several chemical and physical properties of crude oils are affected. The oils are (1) emulsified; (2) acidified; (3) there is a qualitative and quantitative change in light and heavy fractions of the crudes; (4) there are chemical changes in fractions containing sulfur compounds; (5) there is an apparent reduction in the concentration of trace metals; (6) the qualitative and quantitative changes appear to be microbial species dependent; and (7) there is a distinction between "biodegraded" and "biotreated" oils. Preliminary results indicate the introduced microorganisms may become the dominant species in the bioconversion of oils. These studies also indicate the biochemical interactions between crude oils and microorganisms follow distinct trends, characterized by a group of chemical markers. Core-flooding experiments have shown significant additional crude oil recoveries are achievable with thermophilic microorganisms at elevated temperatures similar to those found in oil reservoirs. In addition, the biochemical treatment of crude oils has technological applications in downstream processing of crude oils such as in upgrading of low grade oils and the production of hydrocarbon based detergents.

23070 (DOE/BC/14477–18) **An experimental and theoretical study to relate uncommon rock/fluid properties to oil recovery. Final report.** Watson, R. Pennsylvania State Univ., University Park, PA (United States). Jul 1995. 299p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-89BC14477. Order Number DE95000164. Source: OSTI; NTIS; GPO Dep.

Waterflooding is the most commonly used secondary oil recovery technique. One of the requirements for understanding waterflood performance is a good knowledge of the basic properties of the reservoir rocks. This study is aimed at correlating rock-pore characteristics to oil recovery from various reservoir rock types and incorporating these properties into empirical models for Predicting oil recovery. For that reason, this report deals with the analyses and interpretation of experimental data collected from core floods and correlated against measurements of absolute permeability, porosity. wettability index, mercury porosimetry properties and irreducible water saturation. The results of the radial-core the radial-core and linear-core flow investigations and the other associated experimental analyses are presented and incorporated into empirical models to improve the predictions of oil recovery resulting from waterflooding, for sandstone and limestone reservoirs. For the radial-core case, the standardized regression model selected, based on a subset of the variables, predicted oil recovery by waterflooding with a standard deviation of 7%. For the linear-core case, separate models are developed using common, uncommon and combination of both types of rock properties. It was observed that residual oil saturation and oil recovery are better predicted with the inclusion of both common and uncommon rock/fluid properties into the predictive models.

23071 (DOE/BC/14862–10) **Productivity and injectivity of horizontal wells. Annual report for the period, March 10, 1994–March 9, 1995.** Fayers, F.J. Stanford Univ., CA (United States). Dept. of Petroleum Engineering. Jul 1995. 160p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93BC14862. Order Number DE95000163. Source: OSTI; NTIS; GPO Dep.

Contents of this annual report include the following: (1) detailed well model for reservoir simulation–task 1; (2) comparative aspects of coning behavior in vertical and horizontal wells–task 1; (3) skin factor calculations for vertical, deviated, and horizontal wells–task 2; (4) a dissipation-based coarse grid system and its application to the scaleup of two phase problems–tasks 2 and 4; (5) analyses of experiments at Marathon Oil Company–task 3; (6) development of mechanistic model for multiphase flow in horizontal wells–task 3; and (7) sensitivity studies of wellbore friction and inflow for a horizontal well–task 8.

23072 (DOE/BC/14864–14) **Study of hydrocarbon miscible solvent slug injection process for improved recovery of heavy oil from Schrader Bluff Pool, Milne Point Unit, Alaska. Annual report, January 1, 1994–December 31, 1994.** Sharma, G.D. Alaska Univ., Fairbanks, AK (United States). Jul 1995. 117p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93BC14864. Order Number DE95000162. Source: OSTI; NTIS; GPO Dep.

Alaska is the second largest oil producing state in the nation and currently contributes nearly 24% of the nations oil production. It is imperative that Alaskan heavy oil fields be brought into production. Schrader Bluff reservoir, located in the Milne Point Unit, which is part of the heavy oil field known as West Sak is estimated to contain 1.5 billion barrels of (14 to 21 degree API) oil-in-place. The field is currently under production by primary depletion. The eventual implementation of enhanced oil recovery (EOR) techniques will be vital for the recovery of additional oil from this reservoir. The availability of hydrocarbon gases (solvents) on the Alaska North Slope make the hydrocarbon miscible solvent injection process an important consideration for the EOR project in Schrader Bluff reservoir. Since Schrader Bluff oil is heavy and viscous, a water-alternating-gas (WAG) type of process for oil recovery is appropriate since such a process tends to derive synergetic benefits from both water injection (which provides mobility control and improvement in sweep efficiency) and miscible gas injection (which provides improved displacement efficiency). A miscible solvent slug

injection process rather than continuous solvent injection is considered appropriate. Slim tube displacement studies, PVT data and asphaltene precipitation studies are needed for Schrader bluff heavy oil to define possible hydrocarbon solvent suitable for miscible solvent slug displacement process. Coreflood experiments are also needed to determine the effect of solvent slug size, WAG ratio and solvent composition on the recovery and solvent breakthrough. A compositional reservoir simulation study will be conducted later to evaluate the complete performance of the hydrocarbon solvent slug process and to assess the feasibility of this process for improving recovery of heavy oil from Schrader Bluff reservoir.

23073 (DOE/BC/14881–12) **Improving reservoir conformance using gelled polymer systems. Annual report, September 15, 1993–September 24, 1994.** Green, D.W.; Willhite, G.P. Kansas Univ., Lawrence, KS (United States). Jul 1995. 92p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92BC14881. Order Number DE95000158. Source: OSTI; NTIS; GPO Dep.

The objectives of the research program are to (1) identify and develop polymer systems which have potential to improve reservoir conformance of fluid displacement processes, (2) determine the performance of these systems in bulk and in porous media, and (3) develop methods to predict their performance in field applications. The research focuses on three types of aqueous gel systems - a polysaccharide (KUSP1) that gels as a function of pH, a polyacrylamide-chromium(III) system and a polyacrylamide-aluminum citrate system. This report describes work conducted during the second year of a three-year program. Progress was made in the utilization of KUSP1 as a gelling agent. It was shown that gels can be formed in situ in porous media using CO_2 or ester hydrolysis to lower pH. An ester was identified that could be used in field-scale operations. It was determined that KUSP1 will form strong gels when ortho boric acid is added to the system. It was also determined, in cooperation with Abbott Laboratories, that KUSP1 can be produced on a commercial scale. Rheological studies showed that shear rate significantly affects gelation time and gel strength. The effect of rock-fluid interactions at alkaline conditions was examined experimentally and through mathematical modeling. A model was developed that treats non-equilibrium conditions and this is an improvement over previously published models.

23074 (DOE/BC/14884–12) **Surfactant loss control in chemical flooding spectroscopic and calorimetric study of adsorption and precipitation on reservoir minerals. Annual report, September 30, 1993–September 30, 1994.** Somasundaran, P. Columbia Univ., New York, NY (United States). Jun 1995. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92BC14884. Order Number DE95000157. Source: OSTI; NTIS; GPO Dep.

The aim of this project is to elucidate the mechanisms underlying adsorption and surface precipitation of flooding surfactants on reservoir minerals. Effect of surfactant structure, surfactant combinations, other inorganic and polymeric species is being studied. A multi-pronged approach consisting of micro and nano spectroscopy, microcalorimetry, electrokinetics, surface tension and wettability is used to achieve the goals. The results of this study should help in controlling surfactant loss in chemical flooding and also in developing optimum structures and conditions for efficient chemical flooding processes. During the second year of this three year contract, adsorption/desorption of single surfactants and select surfactant mixtures on alumina and silica was studied. Surfactants studied include the anionic sodium dodecyl sulfate (SDS), cationic tetradecyl trimethyl ammonium chloride (TTAC), nonionic pentadecylethoxylated nonyl phenol (NP-15) and the nonionic octaethylene glycol n-dodecyl ether ($C_{12}EO_8$) of varying hydrocarbon chain length. The microstructure of the adsorbed layer in terms of micropolarity and aggregation numbers was probed using fluorescence spectroscopy. Changes of microstructure upon dilution (desorption) were also studied. Presence of the nonionic surfactant in the mixed aggregate led to shielding of the charge of the ionic surfactant which in-turn promoted aggregation but reduced electrostatic attraction between the charged surfactant and the mineral surface. Strong consequences of surfactant interactions in solution upon adsorption as well as correlations between monomer concentrations in mixtures and adsorption were revealed.

23075 (DOE/BC/14885–10) **Development of cost-effective surfactant flooding technology. Annual report for the period, September 30, 1993–September 29, 1994.** Pope, G.; Sepehrnoori, K. Texas Univ., Austin, TX (United States). Center for Petroleum and Geosystems Engineering. Aug 1995. 101p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92BC14885. Order Number DE95000180. Source: OSTI; NTIS; GPO Dep.

This research consists of the parallel development of a new chemical flooding simulator and the application of our existing UTCHEM simulation code to model surfactant flooding. The new code is based upon a completely new numerical method that combines for the first time higher-order finite-difference methods, flux limiters, and implicit algorithms. Results indicate that this approach has significant advantages in some problems and will likely enable us to simulate much larger and more realistic chemical floods once it is fully developed. Additional improvements have also been made to the UTCHEM code, and it has been applied to the study of stochastic reservoirs with and without horizontal wells to evaluate methods to reduce the cost and risk of surfactant flooding. During the second year of this contract, we have already made significant progress on both of these tasks and are ahead of schedule on both of them.

23076 (DOE/BC/14892–5) **Visual display of reservoir parameters affecting enhanced oil recovery. FY 1994 annual report.** Wood, J.R. Michigan Technological Univ., Houghton, MI (United States). Jun 1995. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93BC14892. Order Number DE95000148. Source: OSTI; NTIS; GPO Dep.

Evaluation of oil and gas properties for enhanced oil recovery (EOR) involves a high degree of risk, especially when the fields are old and well past their prime. The purpose of this project is to provide the small-to-medium size oil field operator with the tools necessary to do an EOR evaluation of the same quality and sophistication that only large international oil companies have been able to afford to date. This approach utilizes readily available, affordable computer software and analytical services. This project will provide a detailed example, based on a field trial, of how to evaluate a field for EOR operations utilizing data typically available in a field which has undergone primary development. After reviewing PC-based software from most major vendors, the authors decided that the most effective way to provide a user-friendly, state-of-the-art package to the independent producers who are primary clients is to link the best modules from four different systems: a commercial database, a wireline log analysis program, a mapping program, and a 2D and 3D visualization program, into a flexible, user-friendly unit. This would result in a product that could be used by small oil and gas companies to perform computerized reservoir studies. Progress to date is described.

23077 (DOE/BC/14897–7) **Anisotropy and spatial variation of relative permeability and lithologic character of Tensleep Sandstone reservoirs in the Bighorn and Wind River Basins, Wyoming. Second quarterly, second year, technical progress report, January 1, 1995–March 31, 1995.** Dunn, T.L. Wyoming Univ., Laramie, WY (United States). Inst. for Energy Research. 13 Apr 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93BC14897. Order Number DE95013819. Source: OSTI; NTIS; GPO Dep.

This study is designed to provide improvements in reservoir characterization techniques. Activities include: an examination of the spatial variation and anisotropy of relative permeability in the Tensleep Sandstone reservoirs of Wyoming; the placement of that variation and anisotropy into paleogeographic, depositional and diagenic frameworks; the development of pore system imagery techniques for the calculation of relative permeability; and reservoir simulations testing the impact of permeability and anisotropy on enhanced oil recovery. Results are described.

23078 (DOE/BC/14899–24) **Flow and displacement of Bingham plastics in porous media. Topical report.** Shah, C. (Univ. of Southern California, Los Angeles, CA (United States). Dept. of

Chemical Engineering); Kharabaf, H.; Yortsos, Y. Stanford Univ., CA (United States). Jul 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93BC14899. Order Number DE95000165. Source: OSTI; NTIS; GPO Dep.

Bingham plastics, which exhibit a finite yield stress at zero shear rate, have been used to model the flow behavior of certain heavy oils at reservoir conditions. In such fluids, the onset of flow and displacement occurs only after the applied pressure gradient exceeds a minimum value. Understanding the flow behavior of such fluids has been limited to phenomenological approaches. In this paper, we present numerical simulations and experimental visualization of flow and immiscible displacement of Bingham plastics in porous media using micromodels. First, we describe a novel pore network simulation approach to determine the onset of flow. The dependence of the critical yield stress on the pore-size distribution is discussed. Visualization experiments of the constant-rate immiscible displacement of Bingham plastics in glass micromodels and Hele-Shaw cells are next presented. The process is subsequently simulated in a pore network. Experiments are successfully simulated with the pore network model. We discuss the effect of the yield stress and injection rate on the displacement patterns. We also propose a classification of the displacement patterns, similar to that for Newtonian displacement.

23079 (DOE/BC/14899–25) **Visualization and simulation of immiscible displacement in fractured systems using micromodels: Steam injection.** Yortsos, Y.C. University of Southern California, Los Angeles, CA (United States). Dept. of Chemical Engineering. Jul 1995. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93BC14899. Order Number DE95000150. Source: OSTI; NTIS; GPO Dep.

A study of steam and hot water injection processes in micromodel geometries that mimic a matrix-fracture system was undertaken. The followings were observed: Light components existing in the crude oil generated a very high efficient gas-drive at elevated temperatures. This gas generation in conjunction with natural surfactant existing in the crude oil, lead to the formation of a foam in the fracture and to improved displacement in the matrix. We observed that the steam enters the fracture and the matrix depending on whether the steam rate exceeds or not the critical values. The resulting condensed water also moves preferentially into the matrix or the fracture depending on the corresponding capillary number. Since steam is a non-wetting phase as a vapor, but becomes a wetting phase when condensed in a water-wet system, steam injection involves both drainage and imbibition. It was found that all of the oil trapped by the condensed water can be mobilized and recovered when in contact with steam. We also examined hot-water displacement. In comparison with cold-water experiments at the same capillary number, a higher sweep efficiency for both light and heavy oils was observed. It was found that the loam generated in the fracture during hot-water injection, is more stable than in steamflooding. Nonetheless, hot-water injection resulted into less efficient displacement in its absence.

23080 (DOE/BC/14899–26) **Visualization and simulation of immiscible displacement in fractured systems using micromodels: Imbibition.** Hadghighi, M.; Yortsos, Y.C. University of Southern California, Los Angeles, CA (United States). Dept. of Chemical Engineering. Jul 1995. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93BC14899. Order Number DE95000149. Source: OSTI; NTIS; GPO Dep.

A study of imbibition processes in micromodel geometries that mimic a matrix-fracture system was undertaken. Experiments in glass micromodels and pore network simulation were conducted. It was observed that, at low capillary number values the wetting fluid preferentially invaded the matrix. Two critical capillary numbers were identified, one for the start of penetration in the fracture when the viscosity ratio was much less than one, and another for which the rate of propagation of the front in the fracture is the same with that in the matrix, when the viscosity ratio was greater than one. These critical capillary numbers were well matched with the results of a pore network simulation. We also developed a simplified theory for both critical numbers. Free imbibition in fractured system was investigated an[] compared favorably with pore network simulation. This process first involves the ra.pi(i invasion of the matrix, followed by the subsequent penetration of the fracture.

23081 (DOE/BC/14899–27) **Scaling of bubble growth in a porous medium. Topical report.** Satik, C. (Univ. of Southern California, Los Angeles, CA (United States). Dept. of Chemical Engineering); Yortsos, Y.; Li, X. Stanford Univ., CA (United States). Jul 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93BC14899. Order Number DE95000166. Source: OSTI; NTIS; GPO Dep.

Processes involving liquid-to-gas phase change in porous media are routinely encountered, for example in the recovery of oil, geothermal processes, nuclear waste disposal or enhanced heat transfer. They involve diffusion (and convection) in the pore space, driven by an imposed supersaturation in pressure or temperature. Phase change proceeds by nucleation and phase growth. Depending on pore surface roughness, a number of nucleation centers exist, thus phase growth occurs from a multitude of clusters. Contrary to growth in the bulk or in a Hele-Shaw cell, however, growth patterns in porous media are disordered and not compact. As in immiscible displacements, they reflect the underlying pore microstructure. The competition between multiple clusters is also different from the bulk. For example, cluster growth may be controlled by a combination of diffusion (e.g. Laplace equation in the quasi-static case) with percolation. Novel growth patterns axe expected from this competition. While multiple cluster growth is important, the simpler problem of single-bubble growth is still not well understood. In this section, we focus on the growth of a single bubble, subject to a fixed far-field supersaturation (e.g. by lowering the pressure in a supersaturated solution or by raising the temperature in a. superheated liquid). Our emphasis is on deriving a scaling theory for growth at conditions of quasi-static diffusion, guided by recent experimental observations. Visualization of bubble growth in model porous media was recently conducted using 2-D etched-glass micromodels.

23082 (DOE/BC/14899–28) **Supri heavy oil research program. Annual report, February 8, 1994–February 7, 1995.** Brigham, W. Stanford Univ., CA (United States). Petroleum Research Inst. Jul 1995. 175p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93BC14899. Order Number DE95000167. Source: OSTI; NTIS; GPO Dep.

Research projects on enhanced recovery are reported on in this report. Studies include: flow properties; in-situ combustion; steam with additives; and field support definitions.

23083 (DOE/BC/14957–8) **Improved oil recovery in fluvial dominated deltaic reservoirs of Kansas – near-term. Seventh quarterly report, February 1, 1995–April 1, 1995.** Green, D.W.; Willhite, G.P.; Walton, A.; Schoeling, L.; Reynolds, R.; Michnick, M.; Watney, L. Kansas Univ. Center for Research, Inc., Lawrence, KS (United States). 15 Apr 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14957. Order Number DE95014905. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to address waterflood problems of the type found in Cherokee Group reservoirs in southeastern Kansas and in Morrow sandstone reservoirs in southwestern Kansas. Two demonstration sites operated by different independent oil operators are involved in the project. The Nelson Lease (an existing waterflood) is located in Allen County, Kansas in the N.E. Savonburg Field and is operated by James E. Russell Petroleum, Inc. The Stewart Field (on latter stage of primary production) is located in Finney County, Kansas and is operated by Sharon Resources, Inc. General topics to be addressed will be (1) reservoir management and performance evaluation, (2) waterflood optimization, and (3) the demonstration of recovery processes involving off-the-shelf technologies which can be used to enhance waterflood recovery, increase reserves, and reduce the abandonment rate of these reservoir types. The reservoir management portion of the project will involve performance evaluation and will include such work as (1) reservoir characterization and the development of a reservoir database, (2) identification of operational problems, (3) identification of near wellbore problems, (4) identification of unrecovered mobile oil and estimation of recovery factors, and (5)

identification of the most efficient and economical recovery process. The waterflood optimization portion of the project involves only the Nelson Lease. It will be based on the performance evaluation and will involve (1) design and implementation of a water cleanup system for the waterflood, (2) application of well remedial work such as polymer gel treatments to improve vertical sweep efficiency, and (3) changes in waterflood patterns to increase sweep efficiency. Finally, it is planned to implement an improved recovery process, possibly polymer augmented waterflood: on both field demonstration sites.

23084 (DOE/BC/14960–8) **Post waterflood CO_2 miscible flood in light oil, fluvial-dominated deltaic reservoir. Annual report, October 1, 1993–September 30, 1994.** Bou-Mikael, S. Texaco Exploration and Production, Inc., New Orleans, LA (United States). Jul 1995. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14960. Order Number DE95000173. Source: OSTI; NTIS; GPO Dep.

Texaco Exploration and Production Inc. (TEPI) and the U.S. Department of Energy (DOE) entered into a cost sharing cooperative agreement to conduct an Enhanced Oil Recovery demonstration project at Port Neches. The field is located in Orange County near Beaumont, Texas. The project will demonstrate the effectiveness of the CO_2, miscible process in Fluvial Dominated Deltaic reservoirs. It will also evaluate the use of horizontal CO_2 injection wells to improve the overall sweep efficiency. A data base of FDD reservoirs for the gulf coast region will be developed by LSU, using a screening model developed by Texaco Research Center in Houston. Finally, the results and the information gained from this project will be disseminated throughout the oil industry via a series of SPE papers and industry open forums. Reservoir characterization efforts for the Marginulina sand, are in progress utilizing conventional and advanced technologies including 3-D seismic. Sidewall and conventional. cores were cut and analyzed, lab tests were conducted on reservoir fluids, reservoir BHP pressure and reservoir voidage were monitored as shown. Texaco is utilizing the above data to develop a Stratamodel to best describe and characterize the reservoir and to use it as an input for the compositional simulator. The current compositional model is being revised to integrate the new data from the 3-D seismic and field performance under CO_2 injection, to ultimately develop an accurate economic model. All facilities work has been completed and placed in service including the CO_2 pipeline and metering equipment, CO_2 injection and production equipment, water injection equipment, well work and injection/production lines. The horizontal injection well was drilled and completed on January 15, 1994. CO_2 purchases from Cardox continue at an average rate of 3600 MCFD. The CO_2 is being injected at line pressure of 1350 psi.

23085 (DOE/BC/14960–9) **Post waterflood CO_2 miscible flood in light oil fluvial dominated deltaic reservoirs. Second quarterly technical progress report, [January 1, 1995–March 31, 1995].** Texaco Exploration and Production, Inc., Bridge City, TX (United States). 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14960. Order Number DE95014911. Source: OSTI; NTIS; GPO Dep.

Production from the Marg Area 1 at Port Neches is averaging 392 barrels of oil per day (BOPD) for this quarter. The production drop is due to fluctuation in both GOR and BS&W on various producing well, coupled with low water injectivity in the reservoir. We were unable to inject any tangible amount of water in the reservoir since late January. Both production and injection problems are currently being evaluated to improve reservoir performance. Well Kuhn (No. 6) was stimulated with 120 MMCF of CO_2, and was placed on production in February 1, 1995. The well was shut in for an additional month after producing dry CO_2 initially. The well was opened again in early April and is currently producing about 40 BOPD. CO_2 injection averaged 11.3 MMCFD including 4100 MMCFD purchased from Cardox, while water injection averaged 1000 BWPD with most of the injection occurring in the month of January.

23086 (DOE/BC/14962–7) **The utilization of the microflora indigenous to and present in oil-bearing formations to selectively plug the more porous zones thereby increasing oil recovery during waterflooding. Annual report for the period, January 1, 1994–December 31, 1994.** Brown, L.; Vadie, A. Hughes Eastern Corp., Jackson, MS (United States). Aug 1995. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-94BC14962. Order Number DE95000177. Source: OSTI; NTIS; GPO Dep.

This project is a field demonstration of the ability of insitu indigenous microorganisms in the North Blowhorn Creek Oil Field to reduce the flow of injection water in the more permeable zones thereby diverting flow to other areas of the reservoir and thus increase the efficiency of the waterflooding operation. This effect is to be accomplished by adding inorganic nutrients in the form of Potassium nitrate and orthophosphate, to the injection water. In Phase I, which has been completed, the following results were obtained. Two new wells were drilled in the field and live cores were recovered. Analyses of the cores proved that viable microorganisms were present and since no sulfate-reducing bacteria (SRB) were found, the area in which the wells were drilled, probably had not been impacted by injection water, since SRB were prevalent in fluids from most wells in the field. Laboratory waterflooding tests using live cores demonstrated that the rate of flow Of simulated production water through the core increased with time when used alone while the rate of flow decreased when nitrate and phosphate salts were added to the simulated production water. Since there is only a small amount of pressure on the influent, the simulated production water was not forced to sweep other areas of the core. The field demonstration (Phase II) involves adding nutrients to four injector wells and monitoring the surrounding producers. The exact kind and amounts of nutrients to be employed and the schedule for their injection were formulated on the basis of information obtained in the laboratory waterflooding tests conducted using the live cores from the field. Results obtained in these tests will not only be compared to historical data for the wells but also to four injectors and their corresponding producers (control) which were chosen for their similarity to the four test patterns.

23087 (DOE/BC/14963–8) **West Hackberry Tertiary Project. Quarterly technical progress report, March 3, 1995–June 2, 1995.** Gillham, T.; Cerveny, B.; Turek, E. Amoco Production Co., Houston, TX (United States). 31 May 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14963. Order Number DE95014910. Source: OSTI; NTIS; GPO Dep.

The goal of the West Hackberry Tertiary Project is to demonstrate the technical and economic feasibility of combining air injection with the Double Displacement Process for tertiary oil recovery. The Double Displacement Process is the gas displacement of a water invaded oil column for the purpose of recovering oil through gravity drainage. The novel aspect of this project is the use of air as the injection fluid. The target reservoir for the project is the Camerina C-1,2,3 Sand located on the West Flank of West Hackberry Field in Cameron Parish, Louisiana. If successful, this project will demonstrate that the use of air injection in the Double Displacement Process can economically recover oil in reservoirs where tertiary oil recovery is presently uneconomic. Air injection was initiated on November 17, 1994. During this quarter, the West Hackberry Tertiary Project completed the first six months of air injection operations. The following events are reviewed in this quarter's technical progress report: (1) early nitrogen breakthrough seen in the Gulf Land D No. 56; (2) corrosion downhole in the air injectors and at the wellsite injection skid; (3) fill in the Watkins No. 16 air injection well; (4) temperature logs run in air injectors(after 24 hours of shut-in); (5) substantial air compressor down time; and (6) official startup ceremony and technology transfer activities.

23088 (DOE/BC–95000168) **Foam flow through a transparent rough-walled rock fracture.** Kovscek, A. (and others); Tretheway, D.; Radke, C. Lawrence Berkeley Lab., CA (United States). Jul 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95000168. Source: OSTI; NTIS; GPO Dep.

This paper presents an experimental study of nitrogen, water, and aqueous foam flow through a transparent replica of a natural rough-walled rock fracture with a hydraulic aperture of roughly 30 μm. It is established that single-phase flow of both nitrogen and water is well described by analogy to flow between parallel plates. Inertial effects caused by fracture roughness become important in

single-phase flow as the Reynolds number approaches 1. Foam exhibits effective control of gas mobility. Foam flow resistances are approximately 10 to 20 times greater than those of nitrogen over foam qualities spanning from 0.60 to 0.99 indicating effective gas-mobility control. Because previous studies of foam flow have focused mainly upon unfractured porous media, little information is available about foam flow mechanisms in fractured media. The transparency of the fracture allowed flow visualization and demonstrated that foam rheology in fractured media depends upon bubble shape and size. Changes in flow behavior are directly tied to transitions in bubble morphology.

23089 (DOE/BC–95000169) **A population balance model for transient and steady-state foam flow in Boise sandstone.** Kovscek, A.; Patzek, T.; Radke, C. Lawrence Berkeley Lab., CA (United States). Jul 1995. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95000169. Source: OSTI; NTIS; GPO Dep.

An experimental and mechanistic-modeling study is reported for the transient flow of aqueous foam through 1.3-μm^2 (1.3-D) Boise sandstone at backpressures in excess of 5 MPa (700 psi) over a quality range from 0.80 to 0.99. Total superficial velocities range from as little as 0.42 to 2.20 m/day (1.4 ft/day to 7 ft/day). Sequential pressure taps and gamma-ray densitometry measure flow resistance and in-situ liquid saturations, respectively. We garner experimental pressure and saturation profiles in both the transient and steady states. Adoption of a mean-size foam-bubble conservation equation along with the traditional reservoir simulation equations allows mechanistic foam simulation. Since foam mobility depends heavily upon its texture, the bubble population balance is both useful and necessary as the role of foam texture must be incorporated into any model which seeks accurate prediction of flow properties. Our model employs capillary-pressure-dependent kinetic expressions for lamellae generation and coalescence and also a term for trapping of lamellae. Additionally, the effects of surfactant chemical transport are included. We find quantitative agreement between experimental and theoretical saturation and pressure profiles in both the transient and steady states.

23090 (DOE/MC/30127–4061) **Providing solutions to energy and environmental problems. Quarterly technical progress report, October–December 1994.** Western Research Inst., Laramie, WY (United States). Feb 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-93MC30127. Order Number DE95014924. Source: OSTI; NTIS; GPO Dep.

Progress reports are briefly described for the following tasks: Development and demonstration of a practical electric downhole steam generator for thermal recovery of heavy oil and tar; wetting behavior of selected crude oil/brine/rock systems; coal gasification, power generation and product market study; the impact of leachate from clean coal technology waste on the stability of clay liners; injecton into coal seams for simultaneous CO_2 mitigation and enhanced recovery of coalbed methane; optimization of carbonizer operations in the FMC coke process; chemical sensor and field screening technology development; demonstration of the Koppleman "Series C" process using a batch; test unit with powder river basin coal as feed; remote chemical sensor development; market assessment and technical feasibility study of PFBC ash use; solid state NMR analysis of naturally and artificially matured kerogens; contained recovery of oily wastes field demonstration with bell lumber and pole; insitu treatment of manufactured gas plant contaminated soils; development and demonstration of a wood-fired gas turbine system; solid state NMR analysis of Mowry Formation Shale from different sedimentary basins; and acid-mine drainage prevention, control, and treatment development for the stockett/sand coulee area.

23091 (DOE/MC/30127–4062) **Providing solutions to energy and environmental problems. Quarterly technical progress report, January–March 1995.** Western Research Inst., Laramie, WY (United States). May 1995. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-93MC30127. Order Number DE95014922. Source: OSTI; NTIS; GPO Dep.

Brief progress reprots are presented for the following tasks: development and demonstration of a practical electric downhole steam generator for thermal recovery of heavy oil and tar; wetting behavior of selected crude oil/brine/rock systems; coal gasification, power generation and product market study; the impact of leachate from clean coal technology waste on the stability of clay liners; injection into coal seams for simultaneous co_2 mitigation and enhanced recovery of coalbed methane; optimization of carbonizer operations in the FMC coke process; chemical sensor and field screening technology development; demonstration of the Koppleman "Series C" process using a batch; test unit with powder river basin coal as feed; remote chemical sensor development; market assessment and technical feasibility study of PFBC ash use; solid state NMR analysis of naturally and artificially matured kerogens; contained recovery of oily wastes field demonstration with bell lumber and pole; insitu treatment of manufactured gas plant contaminated soils; development and demonstration of a wood-fired. Gas turbine system; solid state NMR analysis of mowry formation shale from different sedimentary basins; and acid-mine drainage prevention, control, and treatment development for the stockett/sand coulee area.

23092 (DOE/MT/92007–9) **Characterization of oil and gas waste disposal practices and assessment of treatment costs. Final report.** Bedient, P. Rice Univ., Houston, TX (United States). Aug 1995. 203p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92MT92007. Order Number DE95000175. Source: OSTI; NTIS; GPO Dep.

This study examines wastes associated with the onshore exploration and production of crude oil and natural gas in the United States. The objective of this study was to update and enhance the current state of knowledge with regard to oil and gas waste quantities, the potential environmental impact of these wastes, potential methods of treatment, and the costs associated with meeting various degrees of treatment. To meet this objective, the study consisted of three tasks: (1) the development of a Production Environmental Database (PED) for the purpose of assessing current oil and gas waste volumes by state and for investigating the potential environmental impacts associated with current waste disposal practices on a local scale; (2) the evaluation of available and developing technologies for treating produced water waste streams and the identification of unit process configurations; and (3) the evaluation of the costs associated with various degrees of treatment achievable by different treatment configurations. An updated assessment of the annual domestic Production volume of drilling waste and produced water by onshore drilling and production activity showed there to be a general decline in the volumes of drilling waste being produced over the period 1985 – 1992 as well as an apparent reduction in the volume of produced water generated since 1986. A 59% reduction in the volume of drilling waste over 1985 levels was estimated. The evaluation of feasible technologies for the treatment of produced water waste streams was handled in the context of comparing the level of treatment achievable withthe associated cost of treatment. Treatment processes were evaluated for the removal of four categories of produced water contaminants: particulate material, volatile organic compounds, adsorbable organic compounds, and dissolved inorganic species. Results showed dissolved inorganic species to be the most costly to remove.

23093 (DOE/MT/92011–12) **Geologic, geochemical, and geographic controls on NORM in produced water from Texas oil, gas, and geothermal reservoirs. Final report.** Fisher, R. Texas Univ., Austin, TX (United States). Aug 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92MT92011. Order Number DE95000178. Source: OSTI; NTIS; GPO Dep.

Water from Texas oil, gas, and geothermal wells contains natural radioactivity that ranges from several hundred to several thousand Picocuries per liter (pCi/L). This natural radioactivity in produced fluids and the scale that forms in producing and processing equipment can lead to increased concerns for worker safety and additional costs for handling and disposing of water and scale. Naturally occurring radioactive materials (NORM) in oil and gas operations are mainly caused by concentrations of radium-226 (^{226}Ra) and radium-228 (^{228}Ra), daughter products of uranium-238 (^{238}U) and thorium-232 (^{232}Th), respectively, in barite scale. We examined (1) the geographic distribution of high NORM levels in oil-producing and gas-processing equipment, (2) geologic controls

on uranium (U), thorium (Th), and radium (Ra) in sedimentary basins and reservoirs, (3) mineralogy of NORM scale, (4) chemical variability and potential to form barite scale in Texas formation waters, (5) Ra activity in Texas formation waters, and (6) geochemical controls on Ra isotopes in formation water and barite scale to explore natural controls on radioactivity. Our approach combined extensive compilations of published data, collection and analyses of new water samples and scale material, and geochemical modeling of scale Precipitation and Ra incorporation in barite.

23094 (DOE/MT/92020–10) **Improvement of hydrogen solubility and entrainment in hydrocracker feedstocks. Quarterly technical report, January 1, 1995–March 31, 1995.** Kabadi, V.N. North Carolina Agricultural and Technical State Univ., Greensboro, NC (United States). Dept. of Chemical Engineering. [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92MT92020. Order Number DE95014904. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to determine the conditions for the hydrogen-heavy oil feed preparation so as to optimize the yield of hydrocracking reactions. Proper contacting of hydrogen with heavy oil on the catalytic bed is necessary to improve the yields of the hydrocracking reactions. It is most desirable to have the necessary amount of hydrogen available either in the dissolved or in entrained state, so that hydrogen diffusion to the reaction site does not provide rate controlling resistance to the overall rates of hydrocracking reactions. This project proposes to measure solubility and entrainment data for hydrogen in heavy oils at conditions such as in hydrocrackers, and investigate the improvement of these properties by usage of appropriate additives. Specifically, measurements will be carried out at temperatures up to 300°C and pressures up to 120 atmospheres. Correlations for solubility and entrainment kinetics will be developed from the measured data, and a method for estimating yield of hydrocracking reactions using these correlations will be suggested. Exxon Research and Engineering Company will serve as private sector collaborator providing A&T with test samples and some technical expertise that will assure successful completion of the project. Results are presented for solubility of hydrogen in hydrocarbons and in heavy petroleum fractions. Comparison with experimental data shows good agreements. It is also demonstrated that the model is easily applied to compute solubility of hydrogen in heavy petroleum fractions with fair degree of accuracy. Detailed results are presented.

23095 (LA-UR–95-741) **A three-phase centrifuge to minimize waste from production tank bottoms and sludges: An economic analysis.** Polston, C.E. (Los Alamos National Lab., NM (United States)); Parkinson, W.J.; Graham, A.L.; Steele, R.D.; Bretz, R.E. Los Alamos National Lab., NM (United States). [1995]. 19p. Sponsored by USDOE, Washington, DC (United States);Rio Grande Technology Foundation (United States). DOE Contract W-7405-ENG-36. (CONF-950333–1: 2. SPE/EPA exploration and production environmental conference: government and industry working together to find cost effective approaches to protecting the environment, Houston, TX (United States), 27-29 Mar 1995). Order Number DE95007831. Source: OSTI; NTIS; GPO Dep.

The performance of a three-phase centrifuge process in separating tank bottoms into salable oil, brine and solids was scaled using the sigma method. The profitability was analyzed for a range of processed volumes for three business scenarios: producer owned, service company and a disposal facility. Centrifuge processes operated at full capacity in these situations may be very profitable investments but any investment decision should be heavily influenced by the annual volume to be processed, the quality of the feed and the price received for separated oil.

0206 Health and Safety

23096 (BNL–61987) **Risk assessment for produced water discharges to Louisiana Open Bays.** Meinhold, A.F.; DePhillips, M.P.; Holtzman, S. Brookhaven National Lab., Upton, NY (United States). 23 Jun 1995. 152p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95015403. Source: OSTI; NTIS; GPO Dep.

Data were collected prior to termination of discharge at three sites (including two open bay sites at Delacroix Island and Bay De Chene) for the risk assessments. The Delacroix Island Oil and Gas Field has been in production since the first well drilling in 1940; the Bay De Chene Field, since 1942. Concentrations of 226Ra, 228Ra, 210Po, and 228Th were measured in discharges. Radium conc. were measured in fish and shellfish tissues. Sediment PAH and metal conc. were also available. Benthos sampling was conducted. A survey of fishermen was conducted. The tiered risk assessment showed that human health risks from radium in produced water appear to be small; ecological risk from radium and other radionuclides in produced water also appear small. Many of the chemical contaminants discharged to open Louisiana bays appear to present little human health or ecological risk. A conservative screening analysis suggested potential risks to human health from Hg and Pb and a potential risk to ecological receptors from total effluent, Sb, Cd, Cu, Pb, Ni, Ag, Zn, and phenol in the water column and PAHs in sediment; quantitiative risk assessments are being done for these contaminants.

0207 Economic, Industrial, and Business Aspects

23097 (DOE/EIA–0109(95/06)) **Petroleum supply monthly, June 1995 with data for April 1995.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 28 Jun 1995. 150p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014526. Source: OSTI; NTIS; GPO; GPO Dep.

The Petroleum Supply Monthly (PSM) is one of a family of four publications produced by the Petroleum Supply Division within the Energy Information Administration (EIA) reflecting different levels of data timeliness and completeness. The other publications are the Weekly Petroleum Status Report (WPSR), the Winter Fuels Report, and the Petroleum Supply Annual (PSA). Data presented in the PSM describe the supply and disposition of petroleum products in the United States and major US geographic regions. The data series describe production, imports and exports, inter-Petroleum Administration for Defense (PAD) District movements, and inventories by the primary suppliers of petroleum products in the United States (50 States and the District of Columbia). The reporting universe includes those petroleum sectors in primary supply. Included are: petroleum refiners, motor gasoline blenders, operators of natural gas processing plants and fractionators, inter-PAD transporters, importers, and major inventory holders of petroleum products and crude oil. When aggregated, the data reported by these sectors approximately represent the consumption of petroleum products in the United States. Data presented in the PSM are divided into two sections: Summary Statistics and Detailed Statistics.

23098 (DOE/EIA–0380(95/07)) **Petroleum marketing monthly with data for April 1995.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 5 Jul 1995. 199p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014949. Source: OSTI; NTIS; GPO; GPO Dep.

The Petroleum Marketing Monthly (PMM) provides information and statistical data on a variety of crude oils and refined petroleum products. The publication presents statistics on crude oil costs and refined petroleum products sales for use by industry, government private sector analysts, educational institutions, and consumers. Data on crude oil include the domestic first purchase price, the f.o.b. and landed cost of imported crude oil, and the refiners' acquisition cost of crude oil. Refined petroleum product sales data include motor gasoline, distillates, residuals, aviation fuels, kerosene, and propane. The Petroleum Marketing Division, Office

of Oil and Gas, Energy Information Administration ensures the accuracy, quality, and confidentiality of the published data on the Petroleum Marketing Monthly. Monthly statistics on purchases of crude oil and sales of petroleum products are presented in the Petroleum Marketing Monthly in five sections: Summary statistics; crude oil prices; prices of petroleum products; volumes of petroleum products; and prime supplier sales volumes of petroleum products for local consumption.

23099 (DOE/EIA–0520(95/06)) **International petroleum statistics report, June 1995.** USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use. 27 Jun 1995. 83p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014555. Source: OSTI; NTIS; GPO; GPO Dep.

The report presents data on international oil production, demand, imports, exports, and stocks. The report has four sections. Section 1 contains time series data on world oil production, and on oil demand and stocks in the Organization for Economic Cooperation and Development (OECD). This section contains annual data beginning in 1985, and monthly data for the most recent two years. Section 2 presents an oil supply/demand balance for the world. This balance is presented in quarterly intervals for the most recent two years. Section 3 presents data on oil imports by OECD countries. This section contains annual data for the most recent year, quarterly data for the most recent two quarters, and monthly data for the most recent twelve months. Section 4 presents annual time series data on world oil production and oil stocks, demand, and trade in OECD countries. World oil production and OECD demand data are for the years 1970 through 1994; OECD stocks from 1973 through 1994; and OECD trade from 1984 through 1994. 4 figs., 45 tabs.

23100 (DOE/EIA–0543(95/1Q)) **US energy industry financial developments, First quarter 1995.** USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use. 19 Jun 1995. 22p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014360. Source: OSTI; NTIS; GPO; GPO Dep.

This report traces key developments in US energy companies' financial performance for the first quarter of 1995. Financial data (only available for publicly-traded US companies) are included in two broad groups – fossil fuel production and rate-regulated utilities. All financial data are taken from public sources such as corporate reports and press releases, energy trade publications, and The Wall Street Journal's Earnings Digest. Return on equity is calculated from data available from Standard and Poor's Compustat data service. Since several major petroleum companies disclose their income by lines of business and geographic area, these data are also presented in this report. Although the disaggregated income concept varies by company and is not strictly comparable to corporate income, relative movements in income by lines of business and geographic area are summarized as useful indicators of short-term changes in the underlying profitability of these operations.

23101 (DOE/MT/92008–10) **Oil production enhancement through a standardized brine treatment. Final report.** Adewumi, A.; Watson, R.; Tian, S.; Safargar, S.; Heckman, S.; Drielinger, I. Pennsylvania State Univ., University Park, PA (United States). Aug 1995. 256p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92MT92008. Order Number DE95000179. Source: OSTI; NTIS; GPO Dep.

In order to permit the environmentally safe discharge of brines produced from oil wells in Pennsylvania to the surface waters of the Commonwealth and to rapidly brings as many wells as possible into compliance with the law, the Pennsylvania Oil and Gas Association (POGAM) approached the Pennsylvania State University to develop a program designed to demonstrate that a treatment process to meet acceptable discharge conditions and effluent limitations can be standardized for all potential stripper wells brine discharge. After the initial studies, the first phase of this project was initiated. A bench-scale prototype model was developed for conducting experiments in laboratory conditions. The experiments pursued in the laboratory conditions were focused on the removal of ferrous iron from synthetically made brine. Iron was selected as the primary heavy metals for studying the efficiency of the treatment process. The results of a number of experiments in the lab were indicative of the capability of the proposed brine treatment process in the removal of iron. Concurrent with the laboratory experiments, a comprehensive and extensive kinetic study was initiated. This study was necessary to provide the required data base for process modeling. This study included the investigation of the critical pH as well as the rate and order of reactions of the studied elements: aluminum, lead, zinc, and copper. In the second phase of this project, a field-based prototype was developed to evaluate and demonstrate the treatment process effectiveness. These experiments were conducted under various conditions and included the testing on five brines from different locations with various dissolved constituents. The outcome of this research has been a software package, currently based on iron's reactivity, to be used for design purposes. The developed computer program was refined as far as possible using the results from laboratory and field experiments.

23102 (DOE/MT/92010–8) **Wetland treatment of oil and gas well wastewaters. Quarterly technical report, May 25, 1993-August 24, 1993.** Michigan Univ., Ann Arbor, MI (United States). Dept. of Chemical Engineering. 4 Oct 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92MT92010. Order Number DE95012550. Source: OSTI; NTIS; GPO Dep.

In the third quarterly report adsorption of heavy metals ions such as Cu(II) and Cr(VI) onto soils drawn from the laboratory-type wetland was shown to be weak. Secondly, it was shown that modified-clays did adsorb Cr(VI) ions strongly at pH 4.5. Further, studies on the pH dependence of the adsorption of β-naphthoic acid, (NA), a well-documented contaminant in many oil and gas well waste waters onto modified-clays were undertaken and it was shown that uptake of NA by modified-clays was of the high affinity type at pH 4.5 and 7.0, but weak at pH 9.0. Adsorption of heavy metal ions, Cu^{2+}, and Cr(VI) onto algae, a proposed wetland amendment, was carried out and the results were presented and discussed in the fourth quarterly report. Uptake of NA by the soil component of the laboratory-type wetland was monitored as a function of pH. This quarterly report presents results from studies on the uptake of phenol and β-naphthoic acid by laboratory-type wetlands designed and built during the earlier phases of this study. The uptake of phenol by the wetlands is quite rapid, and nearly complete in 50 hours, but it was also found that evaporative losses of phenol from the supernatant water during the same time period was considerable. On the other hand, β-naphthoic acid (NA) is sorbed quite slowly and there was no indication of evaporative losses in the case on NA.

23103 (DOE/MT/92010–10) **Wetland treatment of oil and gas well waste waters. Final report.** Kadlec, R.; Srinivasan, K. Michigan Univ., Ann Arbor, MI (United States). Aug 1995. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92MT92010. Order Number DE95000176. Source: OSTI; NTIS; GPO Dep.

Constructed wetlands are small on-site systems that possess three of the most desirable components of an industrial waste water treatment scheme: low cost, low maintenance and upset resistance. The main objective of the present study is to extend the knowledge base of wetland treatment systems to include processes and substances of particular importance to small, on-site systems receiving oil and gas well wastewaters. A list of the most relevant and comprehensive publications on the design of wetlands for water quality improvement was compiled and critically reviewed. Based on our literature search and conversations with researchers in the private sector, toxic organics such as Phenolics and b-naphthoic acid, (NA), and metals such as CU(II) and CR(VI) were selected as target adsorbates. A total of 90 lysimeters equivalent to a laboratory-scale wetland were designed and built to monitor the uptake and transformation of toxic organics and the immobilization of metal ions. Studies on the uptake of toxic organics such as phenol and b-naphthoic acid (NA) and heavy metals such as Cu(II)

and Cr(VI), the latter two singly or as non-stoichiometric mixtures by laboratory-type wetlands (LWs) were conducted. These LWs were designed and built during the first year of this study. A road map and guidelines for a field-scale implementation of a wetland system for the treatment of oil and gas wastewaters have been suggested. Two types of wetlands, surface flow (SF) and sub surface flow (SSF), have been considered, and the relative merits of each configuration have been reviewed.

0209 Environmental Aspects

23104 (DOE/MT/92009–12) **Evaluation of the freeze-thaw/ evaporation process for the treatment of produced waters. Quarterly technical progress report, January 1, 1995–March 31, 1995.** Boysen, J.; Morotti, J. Resource Technology Corp., Laramie, WY (United States). Apr 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92MT92009. Order Number DE95014953. Source: OSTI; NTIS; GPO Dep.

The objectives of this project are related to the development of a commercially-economic natural freeze-thaw/evaporation process for the treatment and purification of water produced in conjunction with oil and gas. Progress is reported on laboratory scale process evaluation and field demonstration of the process.

23105 (ENEA-RT-AMB–92-26) **Identification of oil spill's sources.** Boniforti, R. (ENEA, La Spezia (Italy). Centro Ricerche Energia Ambiente Santa Teresa - Area Energia Ambiente e Salute). ENEA, La Spezia (Italy). Centro Ricerche Energia Ambiente Santa Teresa - Area Energia Ambiente e Salute. Oct 1992. 17p. (In Italian). (CONF-9205438–1: Italian-French conference Colombo 1992, Genova (Italy), 22 May 1992). Order Number DE95789727. Source: OSTI; NTIS (US Sales Only); INIS.

Identifying the source of a marine oil spill is complicated because of the rapid modifications (weathering) undergone by oil as soon as it reaches the sea. Deciding if differences occurring between an oil sample collected after the spill and the original oil can be attributed to weathering involves not only adoption of sophisticated analytical methods but also correct sampling techniques and strict adherence to a chain-of-custody procedure. The method described in this paper, largely based on those adopted by some northern European countries, establishes the identity or non-identity of two samples by exploiting differences rather than similarities between them. It increases the efficiency of the method because it is sufficient to establish that there exists only one difference for deciding that two samples are different.

23106 (ETDE-DE–178) **Climate-compatible energy supply in Baden-Wuerttemberg - petroleum products/ refineries.** Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg. Arbeitsberichte, v. 14. Hedden, K. (Karlsruhe Univ. (T.H.) (Germany). Engler-Bunte-Institut Bereich 1 - Gas, Erdoel und Kohle); Jess, A.; Fischer, M. Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg, Stuttgart (Germany). Apr 1994. 47p. (In German). Order Number DE95795825. Source: OSTI; NTIS (US Sales Only).

In the framework of the project study "Climate-compatible energy supply in Baden-Wuerttemberg", the Academy of Technology Assessment of Baden-Wuerttemberg currently investigates possibilities of reducing CO_2 emission. As is well known, Germany intends a 25% reduction of CO_2 emissions from 1990 to 2000. This study investigates the field of petroleum products and refineries. (orig./ HS)

23107 (PNL–10454) **Measurement of polynuclear aromatic hydrocarbon concentrations in the plume of Kuwait oil well fires.** Olsen, K.B. (Pacific Northwest Lab., Richland, WA (United States)); Wright, C.W.; Veverka, C.; Ball, J.C.; Stevens, R. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95008897. Source: OSTI; NTIS; INIS; GPO Dep.

Following their retreat from Kuwait during February and March of 1991, the Iraqi Army set fire to over 500 oil wells dispersed throughout the Kuwait oil fields. During the period of sampling from July to August 1991, it was estimated that between 3.29 x 10^6 barrels per day of crude oil were combusted. The resulting fires produced several plumes of black and white smoke that coalesced to form a composite "super" plume. Because these fires were uncontrolled, significant quantities of organic materials were dispersed into the atmosphere and drifted throughout the Middle East. The organic particulants associated with the plume of the oil well fires had a potential to be rich in polynuclear aromatic hydrocarbon (PAH) compounds. Based on the extreme mutagenic and carcinogenic activities of PAHs found in laboratory testing, a serious health threat to the population of that region potentially existed. Furthermore, the Kuwait oil fire plumes represented a unique opportunity to study the atmospheric chemistry associated with PAHs in the plume. If samples were collected near the plume source and from the plume many kilometers downwind from the source, comparisons could be made to better understand atmospheric reactions associated with particle-bound and gas-phase PAHs. To help answer health-related concerns and to better understand the fate and transport of PAHs in an atmospheric environment, a sampling and analysis program was developed.

03 NATURAL GAS

23108 (DOE/METC/C–95/7191) **Natural Gas Supply SBIR Program.** Shoemaker, H.D.; Gwilliam, W.J. USDOE Morgantown Energy Technology Center, WV (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). (CONF-950494–28: Natural gas research, development and demonstration contractors review meeting, Baton Rouge, LA (United States), 4-6 Apr 1995). Order Number DE95014934. Source: OSTI; NTIS; GPO Dep.

The Small Business Innovation Research (SBIR) program was created in 1982 by Public Law 97-219 and reauthorized in 1992 until the year 2000 by Public Law 102-564. The purposes of the new law are to (1) expand and improve the SBIR program, 2) emphasize the program's goal of increasing private sector commercialization of technology developed through Federal R&D, (3) increase small business participation in Federal R&D, and (4) improve the Federal Government's dissemination of information concerning the SBIR program. DOE's SBIR pro-ram has two features that are unique. In the 1995 DOE SBIR solicitation, the DOE Fossil Energy topics were: environmental technology for natural gas, oil, and coal; advanced recovery of oil; natural gas supply; natural gas utilization; advanced coal-based power systems; and advanced fossil fuels research. The subtopics for this solicitation's Natural Gas Supply topic are (1) drilling, completion, and stimulation; (2) low-permeability Formations; (3) delivery and storage; and (4) natural gas upgrading.

23109 (ANL/ES/CP–85486) **Compressional wave character in gassy, near-surface sediments in southern Louisiana determined from variable frequency cross-well, borehole logging, and surface seismic measurements.** Thompson, M.D. (Argonne National Lab., IL (United States)); McGinnis, L.D.; Wilkey, P.L.; Fasnacht, T. Argonne National Lab., IL (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States);Gas Research Inst., Chicago, IL (United States). DOE Contract W-31109-ENG-38. Contract 5088-252-1770. (CONF-950450–11: 8. annual symposium on the application of geophysics to environmental and engineering problems, Orlando, FL (United States), 23-27 Apr 1995). Order Number DE95013493. Source: OSTI; NTIS; GPO Dep.

Velocity and attenuation data were used to test theoretical equations describing the frequency dependence of compressional wave velocity and attenuation through gas-rich sediments in coastal Louisiana. The cross-well data were augmented with velocities

derived from a nearby seismic refraction station using a low-frequency source. Energy at 1 and 3 kHz was successfully transmitted over distances from 3.69 to 30 m; the 5 and 7-kHz data were obtained only at distances up to 20 m. Velocity tomograms were constructed for one borehole pair and covered a depth interval of 10–50 m. Results from the tomographic modeling indicate that gas-induced low velocities are present to depths of greater than 40 m. Analysis of the velocity dispersion suggests that gas-bubble resonance must be greater than 7 kHz, which is above the range of frequencies used in the experiment. Washout of the boreholes at depths above 15 m resulted in a degassed zone containing velocities higher than those indicated in both nearby refraction and reflection surveys. Velocity and attenuation information were obtained for a low-velocity zone centered at a depth of approximately 18 m. Measured attenuations of 1.57, 2.95, and 3.24 dB/m for the 3-, 5-, and 7-kHz signals, respectively, were modeled along with the velocity data using a silt-clay sediment type. Density and porosity data for the model were obtained from the geophysical logs; the bulk and shear moduli were estimated from published relationships. Modeling results indicate that gas bubbles measuring 1 mm in diameter occupy at least 25% to 35% of the pore space.

23110 (DOE/MC/31224–4052) **Naturally fractured tight gas reservoir detection optimization. Quarterly report, July–September 1994.** Coleman Research Corp., Golden, CO (United States). Nov 1994. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-94MC31224. Order Number DE95000096. Source: OSTI; NTIS; GPO Dep.

This report details the field work undertaken by Coleman Energy and Environmental Systems–Blackhawk Geosciences Division (CEES-BGD) and Lynn, Inc. during the summer of 1994 at a gas field in the Wind River Basin in central Wyoming. The field work described herein consisted of two parts: multicomponent feasibility studies during the 3D P-wave survey on the site, and 9C VSP in a well at the site. The objectives of both surveys were to characterize the nature of anisotropy in the reservoir. With the 9C VSP, established practices were used to achieve this objective in the immediate vicinity of the well. With the multicomponent studies, tests were conducted to establish the feasibility of surface recording of the anisotropic reservoir rocks.

23111 (DOE/MC–85000-95/C0477) **Geotechnology for low-permeability gas reservoirs, 1995.** Brown, S. (Sandia National Labs., Albuquerque, NM (United States). Geomechanics Dept.); Harstad, H.; Lorenz, J.; Warpinski, N.; Boneau, T.; Holcomb, D.; Teufel, L.; Young, C. Sandia National Labs., Albuquerque, NM (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). (CONF-950494–22: Natural gas research, development and demonstration contractors review meeting, Baton Rouge, LA (United States), 4-6 Apr 1995). Order Number DE95012983. Source: OSTI; NTIS; GPO Dep.

The permeability, and thus the economics, of tight reservoirs are largely dependent on natural fractures, and on the in situ stresses that both originated fractures and control subsequent fracture permeability. Natural fracture permeability ultimately determines the gas (or oil) producibility from the rock matrix. Therefore, it is desirable to be able to predict, both prior to drilling and during reservoir production, (1) the natural fracture characteristics, (2) the mechanical and transport properties of fractures and the surrounding rock matrix, and (3) the present in situ stress magnitudes and orientations. The combination of activities described in this report extends the earlier work to other Rocky Mountain gas reservoirs. Additionally, it extends the fracture characterizations to attempts of crosswell geophysical fracture detection using shear wave birefringence and to obtaining detailed quantitative models of natural fracture systems for use in improved numerical reservoir simulations. Finally, the project continues collaborative efforts to evaluate and advance cost-effective methods for in situ stress measurements on core.

Order Number DE95014457. Source: OSTI; NTIS; GPO Dep.

The International Unconventional Gas Symposium was held on May 14–20, 1995 in Tuscaloosa, Alabama where 52 reports were presented. These reports are grouped in this proceedings under: geology and resources; mine degasification and safety; international developments; reservoir characterization/coal science; and environmental/legal and regulatory. Each report has been processed separately for inclusion in the Energy Science and Technology Database.

23113 (DOE/MC–25031-95/C0453) **Secondary natural gas recovery – infield reserve growth joint venture: Applications in midcontinent sandstones.** Finley, R.J.; Hardage, B.A. Texas Univ., Austin, TX (United States). Bureau of Economic Geology. [1995]. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG21-88MC25031. (CONF-950494–15: Natural gas research, development and demonstration contractors review meeting, Baton Rouge, LA (United States), 4-6 Apr 1995). Order Number DE95012314. Source: OSTI; NTIS; GPO Dep.

The primary objective of the Infield Reserve Growth/Secondary Natural Gas Recovery (SGR) project is to develop, test, and verify technologies and methodologies with near- to midterm potential for maximizing the recovery of natural gas from conventional reservoirs in known fields. Additional technical and technology transfer objectives of the SGR project include: To establish how depositional and diagenetic heterogeneities in reservoirs of conventional permeability cause reservoir compartmentalization and, hence, incomplete recovery of natural gas. To document examples of reserve growth occurrence and potential from deltaic and valley-fill sandstones of the Midcontinent as a natural laboratory for developing concepts and testing applications to find secondary gas; to demonstrate how the integration of geology, reservoir engineering, geophysics, and well log analysis/petrophysics leads to strategic recompletion and well placement opportunities for reserve growth in mature fields; and to transfer project results to a wide array of natural gas producers, not just as field case studies, but as conceptual models of how heterogeneities determine natural gas flow units and how to recognize the geologic and engineering clues that operators can use in a cost-effective manner to identify incremental, or secondary, gas.

23114 (DOE/MC/26025–95/C0475) **Liquid-free CO_2/sand fracturing in low-permeability reservoirs.** Mazza, R.L.; Gehr, J.B. Petroleum Consulting Services, Canton, OH (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-90MC26025. (CONF-950494–19: Natural gas research, development and demonstration contractors review meeting, Baton Rouge, LA (United States), 4-6 Apr 1995). Order Number DE95012981. Source: OSTI; NTIS; GPO Dep.

After 16 months of production, CO_2/sand fractured wells in the Pike County, Kentucky, study area produce 2.0 times more gas than nitrogen gas treated wells and produce 21.9 MMcf additional gas per well. After 16 months of production, CO_2/sand fractured wells in the Pike County, Kentucky, study area produce 4.4 times more gas than nitrogen foam treated wells and produce 33.1 MMcf additional gas per well. For the Pike County, Kentucky, study area, payout times for the incremental cost of stimulation is estimated conservatively at less than 9 months. Both groups of wells in the Pike County, Kentucky, study area show consistent relative Production improvements compared to the overall study area results.

23115 (DOE/MC/26026–95/C0482) **Multistrata exploration and production study.** Brunk, R.G.; Maestas, J.R.; Parsons, P.

West Virginia Coll., Beckley, WV (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-89MC26026. (CONF-950494–27: Natural gas research, development and demonstration contractors review meeting, Baton Rouge, LA (United States), 4-6 Apr 1995). Order Number DE95014576. Source: OSTI; NTIS; GPO Dep.

The objective of this project was to develop and verify a geotechnical/geostatistical approach to find natural gas resources and to verify the process by drilling, completing, testing, and producing wells located by the process.

23116 (DOE/MC/28133–95/C0485) **Membrane process for separating H_2S from natural gas.** Baker, R.W. Membrane Technology and Research, Inc., Menlo Park, CA (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC28133. (CONF-950494–24: Natural gas research, development and demonstration contractors review meeting, Baton Rouge, LA (United States), 4-6 Apr 1995). Order Number DE95014481. Source: OSTI; NTIS; GPO Dep.

Objective was to develop a membrane process for separating hydrogen sulfide and other impurities (CO_2, water vapor) from low-quality natural gas. A membrane material was identified with very high H_2/CH_4 selectivity in the range of 40–60; membrane production was scaled up to commercial size rolls; high-pressure membrane and module development and optimization were completed; and a membrane permeation flux of $4 \times 10_{-6}$ $cm^3/s\text{-}cm^2cmHg$, twice as high state-of-the-art cellulose acetate membranes, was achieved.

23117 (DOE/MC/28182–95/C0489) **Steerable percussion air drilling system.** Bui, H.D.; Gray, M.A.; Oliver, M.S. Smith International, Inc., Houston, TX (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC28182. (CONF-950494–32: Natural gas research, development and demonstration contractors review meeting, Baton Rouge, LA (United States), 4-6 Apr 1995). Order Number DE95015006. Source: OSTI; NTIS; GPO Dep.

In the Steerable Percussion Air Drilling System (SPADS), air percussion is used to drill directionally in hard formations. Compared to mud or air powered PDM motors, SPADS offers directional drilling at high penetration rate, reduced mud costs, negligible formation damage, and immediate indication of hole productivity. Field tests turned up problems ranging from tool design to operation procedures; remedies were developed. There is an optimum WOB (weight on bit) at which torque is reasonably low. The hammer was tested at three different line pressures (200, 300, 350 psig) at optimum WOB in granite, limestone, and sandstone.

23118 (DOE/MC/29077–95/C0490) **Fracturing Fluid Characterization Facility (FFCF): Recent advances.** Shah, S.N.; Fagan, J.E. Oklahoma Univ., Norman, OK (United States). School of Petroleum and Geological Engineering. [1995]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-92MC29077. (CONF-950494–26: Natural gas research, development and demonstration contractors review meeting, Baton Rouge, LA (United States), 4-6 Apr 1995). Order Number DE95014985. Source: OSTI; NTIS; GPO Dep.

The objectives of this project are: (1)Investigate fluid rheological behavior, dynamic fluid leak-off behavior, and proppant transport characteristics of various fracturing fluids used for stimulating oil and gas bearing formations. (2) Develop new information for characterizing the behavior of fracturing fluids under conditions more representative of the behavior in actual fractures. (3) Continue utilizing the advanced capabilities of the high pressure simulator (HPS) to perform near-term research and development activities and not to construct a large-scale simulator that was proposed originally. This paper describes equipment enhancements, data acquisition and instrumentation upgrades, R&D test results, and future research planned for the Fracturing Fluid Characterization Facility.

23119 (DOE/MC/31162–95/C0465) **Microbially-enhanced redox solution reoxidation for sweetening sour natural gas.** Rai, C. Texas A and M Univ., Kingsville, TX (United States). Dept. of Chemical and Natural Gas Engineering. [1995]. 14p. Sponsored by USDOE, Washington, DC (United States);Gas Research Inst., Chicago, IL (United States). DOE Contract FG21-94MC31162. 5094-220-3037; Gas Rsearch Institute. (CONF-950494–11: Natural gas research, development and demonstration contractors review meeting, Baton Rouge, LA (United States), 4-6 Apr 1995). Order Number DE95012311. Source: OSTI; NTIS; GPO Dep.

About twenty five percent of natural gas produced in the United States is sour containing significant volumes of hydrogen sulfide and other contaminants. Liquid redox processes remove hydrogen sulfide from natural gas. Aqueous solution of chelated ferric ions oxidize the hydrogen sulfide to elemental sulfur. The reduced iron chelate is then oxidized by contact with air and recycled. This requires expensive equipment for regeneration, costly chemicals and the process is usually energy intensive. Recent studies show that the ferric ion regeneration rates are substantially enhanced in presence of acidophilic bacteria. The specific objectives of this project are to advance the technology and improve the economics of the commercial iron-based chelate processes utilizing biologically-enhanced reoxidation of the redox solutions used in these processes, such as LO-CAT II and SulFerox.

As for methanol as a petroleum substitution fuel, a study is carried out on conditions, etc. suitable for the production plant, with the purpose of practical application of a new method for production of methanol using natural gas as a material. The result indicates that the future methanol plant is expected to produce 5000-10000 tons/day and therefore needs natural gas of 3.7-7.5 million m^3/day and its proved reserves of more than 45-90 billion m^3. It is pointed out that concerning composition of natural gas, the acceptable concentration of carbon dioxide will possibly be lower than that in the steam reforming method. Also reported are that concerning locational conditions, it is difficult to bear a large amount of plant/equipment investment, that the transportation cost is considerably lower than that of LNG, and the marine transportation distance does not become restrictive conditions, and that there are no special conditions of restrictions on the plant and shipping base which are brought by methanol. It is concluded that the Asia and Pacific regions are unsuitable for LNG production, but have a lot of gas fields suitable for methanol production. 15 refs., 5 figs., 60 tabs.

23121 (CONF-9410335–, pp. 222-229) **Development of feed-forward neural network models for gas short-term load forecasting.** Brown, R.H. (Marquette Univ., Milwaukee, WI (United States)); Matin, I.; Feng, X. USDOE Pittsburgh Energy Technology Center, PA (United States); Oregon State Univ., Corvallis, OR (United States). Dept. of Computer Science; Naval Research Lab., Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States); Bureau of Mines, Washington, DC (United States). [1994]. From Adaptive control systems technology symposium; Pittsburgh, PA (United States); 24-25 Oct 1994. In *High-tech controls for energy and environment. Proceedings.* 287p. Order Number DE95011702. Source: OSTI; NTIS; GPO Dep.

The development of feed-forward artificial neural network based models to predict gas consumption on a daily basis is the subject of this paper. The discussion concerns an iterative process based on network sensitivities and intuition regarding selection of proper

input factors. The method is applied in forecasting gas consumption for two regions in the State of Wisconsin, namely, a portion of metropolitan Milwaukee and a region near Fond du Lac. The investigation includes a study of the effects of various network sizes and training algorithms given a limited availability of relevant historical data. The effects of using multiple sources of weather data are also investigated for regions without a centrally located weather recording station. The training results indicate that feed-forward artificial neural network based models reduce the residual predicted consumption root mean squared errors by more than half when compared to models based on linear regression using identical input factors. The inclusion of weather data from multiple sources leads to further error reduction. The models were then used for load forecasting starting in Summer 1994. The static models performed well from the Summer 1993 until the severe cold weather of mid-January 1994. This poor performance was scrutinized; investigations point to probable causes that include severe weather patterns non-existent in the training data and the excitation of consumer behavioral modes either not evident in the training data or not well represented by time-of-the-year input factor proxies. The search for a solution lead to dynamic models that were implemented by updating the neural networks with new data as it became available. These models performed significantly better but still poorly during and after the severe weather of January 1994.

23122 (DOE/MC/13223–95/C0484) **Conversion economics for Alaska North Slope natural gas.** Thomas, C.P.; Robertson, E.P. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-950494–29: Natural gas research, development and demonstration contractors review meeting, Baton Rouge, LA (United States), 4-6 Apr 1995). Order Number DE95015007. Source: OSTI; NTIS; GPO Dep.

For the Prudhoe Bay field, this preliminary analysis provides an indication that major gas sales using a gas pipeline/LNG plant scenario, such as Trans Alaska Gas System, or a gas-to-liquids process with the cost parameters assumed, are essentially equivalent and would be viable and profitable to industry and beneficial to the state of Alaska and the federal government. The cases are compared for the Reference oil price case. The reserves would be 12.7 BBO for the base case without major gas sales, 12.3 BBO and 20 Tcf gas for the major gas sales case, and 14.3 BBO for the gas-to-liquids conversion cases. Use of different parameters will significantly alter these results; e.g., the low oil price case would result in the base case for Prudhoe Bay field becoming uneconomic in 2002 with the operating costs and investments as currently estimated.

23123 (DOE/MC/27346–95/C0480) **Economics of natural gas upgrading.** Hackworth, J.H.; Koch, R.W. K and M Engineering and Consulting Corp., Washington, DC (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-90MC27346. (CONF-950494–25: Natural gas research, development and demonstration contractors review meeting, Baton Rouge, LA (United States), 4-6 Apr 1995). Order Number DE95014024. Source: OSTI; NTIS; INIS; GPO Dep.

Natural gas could be an important alternative energy source in meeting some of the market demand presently met by liquid products from crude oil. This study was initiated to analyze three energy markets to determine if greater use could be made of natural gas or natural gas derived products and if those products could be provided on an economically competitive basis. The three markets targeted for possible increases in gas use were motor fuels, power generation, and the chemical feedstocks market. The economics of processes to convert natural gas to transportation fuels, chemical products, and power were analyzed. The economic analysis was accomplished by drawing on a variety of detailed economic studies, updating them and bringing the results to a common basis. The processes analyzed included production of methanol, MTBE, higher alcohols, gasoline, CNG, and LNG for the transportation market. Production and use of methanol and ammonia in the chemical feedstock market and use of natural gas for power generation were also assessed. Use of both high and low quality gas as a process feed stream was evaluated. The analysis also explored the impact of various gas price growth rates and process facility locations, including remote gas areas. In assessing the transportation fuels market the analysis examined production and use of both conventional and new alternative motor fuels.

Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg, Stuttgart (Germany). Apr 1994. 75p. (In German). Order Number DE95795824. Source: OSTI; NTIS (US Sales Only).

The study investigates the possibilities of reducing CO_2 emissions in Baden-Wuerttemberg by an enhanced use of natural gas. It intends to find out whether the projected goal of a 25% reduction from 1990 to 2005 can be achieved in this way. First, the state of the art of natural gas supply and use in Baden-Wuerttemberg is characterized, and future trends in this field are outlined. Further, the technical potential of CO_2 reduction by the use of natural gas is investigated on the basis of a few selected examples. The cost of the conversion to natural gas is assessed, and the effects on supply reliability, environmental protection and the labour market are assessed. (orig.)

23125 (GRI–94/0227) **Ecological effects of pipeline construction through deciduous forested wetlands, Midland County, Michigan. Topical report, October 1990–August 1992.** Rastorfer, J.R. (Chicago State Univ., IL (United States). Dept. of Biological Sciences); Van Dyke, G.D.; Zellmer, S.D.; Wilkey, P.L. Institute of Gas Technology, Chicago, IL (United States); Argonne National Lab., IL (United States). Apr 1995. 275p. Sponsored by Gas Research Inst., Chicago, IL (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015664. Source: OSTI; NTIS; GPO Dep.

This study is designed to record vegetational changes induced by the construction of a large-diameter gas pipeline through deciduous forested wetlands. Two second-growth wetland sites mapped Lenawee soils were selected in Midland County, Michigan: Site 1, a younger stand subjected to recent selective logging, and Site 2, a more mature stand. The collection of ecological data to analyze plant succession on the right-of-way (ROW) and the effects of the developing ROW plant communities on adjacent forest communities was initiated in 1989. Cover class estimates were made for understory and ROW plant species on the basis of 1 × 1–m quadrats. Individual stem diameters and species counts were recorded for overstory plants in 10–m quadrats. Although long-term studies have not been completed, firm baseline data were established for comparative analyses with future sampling. Current data indicate that vegetation became well-established on the ROW within one year and subsequently increased in coverage. About 65% of the species were wetland indicators, and the dominants included seeded and natural invading species; nevertheless, some elements of the original flora regenerated and persist. The plants of the ecotone understories of both sites changed from their original composition as a result of the installation of the gas pipeline. Although some forest species persist at both sites, the ecotone of Site I was influenced more by the seeded species, whereas the natural invaders were more important at Site 2.

Improved, more efficient natural gas transmission and deliverability systems will be essential for meeting the expected growth in U.S. gas demand in coming decades. Role of gas storage will be important. The most cost-effective means for providing the additional seasonal storage capacity and peak-day deliverability is to improve efficiency of the existing gas storage system (370 gas storage facilities and 17,000 gas storage wells). Up to 5 new fracture stimulation techniques will be field tested. Test sites have been acquired for the 1995 RD&D program.

23127 (DOE/AL/87310–1) **A study of NO_x reduction by fuel injection recirculation. Topical report, January 1995–May 1995.** Turns, S.R.; Feese, J.J.; Frenklach, M.Y. Pennsylvania State Univ., University Park, PA (United States). Jul 1995. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG04-95AL87310. Order Number DE95014709. Source: OSTI; NTIS; GPO Dep.

Flue-gas recirculation (FGR) is a well-known method used to control oxides of nitrogen (NO_x) in industrial burner applications. Recent small- and large-scale experiments by Carnot (Tustin, CA) have shown that introducing the recirculated flue gases with the fuel results in a much greater reduction in NO_x, per unit mass of gas recirculated, in comparison to introducing the flue gases with the combustion air. That fuel injection recirculation (FIR) is more effective than windbox FGR is quite remarkable. At present, however, there is no definitive understanding of why FIR is more effective than conventional FGR. One speculation is that introducing the diluent gases on the fuel side of the flame affects the prompt-NO mechanism causing the greater effectiveness. The objective of our research is to ascertain whether or not chemical and/or molecular transport effects alone can explain the differences in NO_x reduction observed between FIR and FGR. This knowledge will aid in the rational application and optimization of FIR in a wide variety of industrial applications. A combined modeling and experimental program is in progress to achieve the research objectives. This report discusses computer modeling studies of counterflow diffusion flames employing detailed chemical kinetics for fuel (hydrogen or methane) combustion and NO_x formation. These simulations allow the calculation of NO_x emission indices for a wide range of conditions. Parametric studies were conducted in which the diluent was added either on the fuel or air side of the flame for a wide range of flow conditions. Preliminary results from these simulation studies indicate that a major factor in FIR effectiveness is the differential effect on flame zone residence times associated with fuel-side versus air-side dilution.

23130 (POEF-SH–31) **Calculated in-air leakage spectra and power levels for the ANSI standard minimum accident of concern. Final report.** Lee, B.L. Jr.; Dobelbower, M.C.; Tayloe, R.W. Jr. Oak Ridge National Lab., TN (United States). Jul 1995. 147p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-76OR00001. Order Number DE95014999. Source: OSTI; NTIS; INIS; GPO Dep.

This document represents Phase I of a two-phase project. The entire project consists of determining a series of minimum accidents of concern and their associated neutron and photon leakage spectra that may be used to determine Criticality Accident Alarm compliance with ANSI/ANS-8.3. The inadvertent assembly of a critical mass of material presents a multitude of unknown quantities. Depending on the particular process, one can make an educated guess as to fissile material. In a gaseous diffusion cascade, this material is assumed to be uranyl fluoride. However, educated assumptions cannot be readily made for the other variables. Phase I of this project is determining a bounding minimum accident of concern and its associated neutron and photon leakage spectra. To determine the composition of the bounding minimum accident of concern, work was done to determine the effects of geometry, moderation level, and enrichment on the leakage spectra of a critical assembly. The minimum accident of concern is defined as the accident that may be assumed to deliver the equivalent of an absorbed dose in free air of 20 rad at a distance of 2 meters from the reacting material within 60 seconds. To determine this dose, an analyst makes an assumption and choose an appropriate flux to dose response function. The power level required of a critical assembly to constitute a minimum accident of concern depends heavily on

the response function chosen. The first step in determining the leakage spectra was to attempt to isolate the effects of geometry, after which all calculations were conducted on critical spheres. The moderation level and enrichment of the spheres were varied and their leakage spectra calculated. These spectra were then multiplied by three different response functions: the Henderson Flux to Dose conversion factors, the ICRU 44 Kerma in Air, and the MCNP Heating Detector. The power level required to produce a minimum accident of concern was then calculated for each combination.

23131 (DOE/ER/75388–T1) **HEU to LEU fuel conversion. Final report.** Mulder, R.U. Virginia Univ., Charlottesville, VA (United States). School of Engineering and Applied Science. Oct 1994. 731p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER75388. Order Number DE95015477. Source: OSTI; NTIS; INIS; GPO Dep.

The Nuclear Regulatory Commission issued a ruling, effective March 27, 1986, that all U.S. non-power reactors convert from HEU fuel to LEU fuel. A Reduced Enrichment for Research and Test Reactors Program was conducted by the Department of Energy at Argonne National Laboratory to coordinate the development of the high density LEU fuel and assist in the development of Safety Analysis Reports for the smaller non-power reactors. Several meetings were held at Argonne in 1987 with the non-power reactor community to discuss the conversion and to set up a conversion schedule for university reactors. EG&G at Idaho was assigned the coordination of the fuel element redesigns. The fuel elements were manufactured by the Babcock & Wilcox Company in Lynchburg, Virginia. The University of Virginia was awarded a grant by the DOE Idaho Operations Office in 1988 to perform safety analysis studies for the LEU conversion for its 2 MW UVAR and 100 Watt CAVALIER reactors. The University subsequently decided to shut down the CAVALIER reactor. A preliminary SAR on the UVAR, along with Technical Specification changes, was submitted to the NRC in November, 1990. An updated SAR was approved by the NRC in January, 1991. In September, 1992, representatives from the fuel manufacturer (B&W) and the fuel designer (EG&G, Idaho) came to the UVAR facility to observe trial fittings of new 22 plate LEU mock fuel elements. B&W fabricated two non-fuel bearing elements, a regular 22 plate element and a control rod element. The elements were checked against the drawings and test fitted in the UVAR grid plate. The dimensions were acceptable and the elements fit in the grid plate with no problems. The staff made several suggestions for minor construction changes to the end pieces on the elements, which were incorporated into the final design of the actual fuel elements. Selected papers are indexed separately for inclusion in the Energy Science and Technology Database.

23132 (DOE/SF/20218–T2) **Plutonium Consumption Program, CANDU Reactor Project: Feasibility of BNFP Site as MOX Fuel Supply Facility. Final report.** AECL Technologies, Inc., Rockville, MD (United States). 30 Jun 1995. 112p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-94SF20218. Order Number DE95014327. Source: OSTI; NTIS; GPO Dep.

An evaluation was made of the technical feasibility, cost, and schedule for converting the existing unused Barnwell Nuclear Fuel Facility (BNFP) into a Mixed Oxide (MOX) CANDU fuel fabrication plant for disposition of excess weapons plutonium. This MOX fuel would be transported to Ontario where it would generate electricity in the Bruce CANDU reactors. Because CANDU MOX fuel operates at lower thermal load than natural uranium fuel, the MOX program can be licensed by AECB within 4.5 years, and actual Pu disposition in the Bruce reactors can begin in 2001. Ontario Hydro will have to be involved in the entire program. Cost is compared between BNFP and FMEF at Hanford for converting to a CANDU MOX facility.

This report presents information pertaining to the life of the reduction bombs in both the RG and RMM Lines of the Plutonium Purification and Fabrication operations in the 234-5 Building. The expected average life to rupture of the RG Line Bomb of carbon steel subjected to an internal pressure of 450 psig is ten hours at 750 C. The expected average life of the RM Line bomb of V-36 alloy is more than 100,000 hours at 750 C under the same operating

conditions. These expected average life values do not include any calculated factor of safety. Since they are average figures, some bombs could be expected to have shorter life to rupture. The BG Line bomb of carbon steel is definitely hazardous under the extreme service conditions of 450 psig and 750 C. If the use of carbon steel is to be continued it is recommended that the bombs be redesigned to reduce unit stresses.

23140 (JAERI-Research–95-030) **Research on fretting corrosion behavior of structural materials used in nitric acid environments for spent fuel reprocessing. 1. Difference in fretting corrosion resistance among austenitic stainless steel, Ti and Zr.** Sakairi, Masatoshi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Kiuchi, Kiyoshi. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 39p. (In Japanese). Order Number DE95789391. Source: OSTI; NTIS; INIS.

The pin on disk type rotating wear apparatus was used to study the difference of fretting corrosion resistance among type 304ULC austenitic stainless steel (SUS) and refractory metals of zirconium (Zr) and titanium (Ti) immersed in 3N HNO_3 at room temperature. In this experiment, the weight loss of pin and disk increased with time. Comparing with the pin abraded constantly, the disk was repeatedly faced on the removal and the repassivation of the surface film. The thickness loss rate of Zr both pin and disk were larger than that of Ti and SUS. The controlling factors on the corrosion wear of Zr is considered to be mechanically scribing off the metal. A possible reason for corrosion wear difference between Ti and Zr may be dependent on following feature of Zr. Zr has a weak mechanical strength along the specific crystal planes due to hcp type structure and the slow repassivation rate in 3N HNO_3. (author).

23141 (JAERI-Tech–95-016) **Study on the photoacoustic spectroscopy capabilities with remote detection for monitoring of actinide species in nuclear fuel reprocessing solutions.** Sinkov, S.I. (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Kihara, Takehiro; Fujine, Sachio; Maeda, Mitsuru. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 54p. Order Number DE95789324. Source: OSTI; NTIS; INIS.

A LIPAS (Laser Induced Photoacoustic Spectroscopy) system has been developed for remote analysis of weakly absorbing species in solution. A number of photoacoustic cells of various configurations have been examined in remote arrangement of PA spectrometer with application of an optical fiber for the laser light transmission to PA cell. A microscope objective was tested in optical fiber launching arrangement to collimate laser beam after the fiber. It has been shown that short optical pathlengh cuvette type cells in combination with a disk type piezoelectric transducer (PZT) are superior to previously used cylindrical PA cell with a tube type PZT as regards more effective elimination of scattered and reflected light contribution to PZT response. This allows to improve the linearity of calibration curve and to lower the detection limit absorptivity down to $4.2 \times 10^{-5} cm^{-1}$, which has been evaluated using an absorption band of Nd at 511.4 nm. The newly designed PA cell has been applied for investigation of PAS capabilities to detection of Pu(III), Pu(IV) and Pu(VI) simulated species in uranium containing solutions relevant to the nuclear fuel reprocessing technology. It has been shown that the proper selection of plutonium absorption band for each oxidation state allows to reduce high background contribution from U(VI) ions to the analytical PA signal and to keep detection limit absorptivity within a $1\text{-}3 \times 10^{-5} cm^{-1}$ range in the 525-562 nm wavelength region. (author).

23142 (JAERI-Tech–95-024) **Safety demonstration tests of air-ventilation system for the postulated explosive burning in a cell of fuel-reprocessing plant.** Takada, Junichi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Suzuki, Motoe; Tukamoto, Michio; Koike, Tadao; Nishio, Gunji. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 348p. (In Japanese). Order Number DE95789392. Source: OSTI; NTIS; INIS.

Safety demonstration tests of an explosive burning in a cell in the reprocessing plant has been carried out in JAERI under the auspices of the Science and Technology Agency, to evaluate the safety of an air-ventilation system during the hypothetical explosion. The postulated explosive burning of organic solvent mixed with nitric acid was simulated by solid explosives. The demonstration test was performed using an industrial scale experimental facility simulating to the ventilation system of the large scale reprocessing plant in JAPAN. Propagations of pressure, temperature, and gas velocity through cells and ducts in the ventilation system were measured during the explosive burning under deflagration. Experimental data in this report can be used to evaluate the transport phenomena of radioactive materials in the ventilation system during the explosion, and also to verify computer code CELVA for the safety analysis of ventilation system in the event of explosion accidents. (author).

23143 (JAERI-Tech–95-027) **Distribution behavior of 1-butanol in reprocessing solution.** Asakura, Toshihide (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Nemoto, Hideyuki; Uchiyama, Gunzo; Fujine, Sachio; Maeda, Mitsuru. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 44p. (In Japanese). Order Number DE95789315. Source: OSTI; NTIS; INIS.

The distribution behavior of 1-butanol was studied under PUREX process conditions, using the two phase system of the organic solution of tributyl phosphate (TBP) and dodecane, and of the aqueous solution of nitric acid and uranyl nitrate. The distribution ratio of 1-butanol was measured by changing the concentration of 1-butanol, the concentration of TBP in the organic phase, the concentration of uranium in the organic phase, and the concentration of nitric acid in the aqueous phase. The ratios varied from 0.09 to 5 under the present experimental conditions. (author).

23144 (JAERI-Tech–95-029) **Thermochemical test of solvent in nuclear fuel reprocessing plants.** Nishio, Gunju (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Koike, Tadao; Takada, Junichi; Watanabe, Kouzou; Miyata, Sadajirou. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 65p. (In Japanese). Order Number DE95789347. Source: OSTI; NTIS; INIS.

In a Russian reprocessing plant in Tomsk, an explosive event occurred on April 6, 1993 due to pressurization of a tank containing uranyl nitrate solution by a rapid thermal decomposition of solvent with nitric acid. This event shows a singular reaction behavior that a large amount of heat is evolved under a boiling point (121degC) of nitric acid solution, even though a valve at the exhaust pipe of tank is reported to be opened. Accumulation of unstable decomposition materials is inferred in the tank due to a degradation of solvent caused by reactions with nitric acid. The chemical analysis of the degraded solvent was performed and chemical forms of these decomposition materials were identified. Also, the reaction heat of these materials was measured by a differential thermal analyzer (DTA) and a differential scanning calorimeter (DSC). (author).

23145 (WHC-SA–2856) **Using digital systems to control air pulsers.** Silvan, G.R. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-951048–1: International conference and exhibit of the Instrument Society of America, New Orleans, LA (United States), 2-5 Oct 1995). Order Number DE95011636. Source: OSTI; NTIS; INIS; GPO Dep.

Air pulsing is a standard method used at the Hanford Site for enhancing the efficiency of sieve tray columns. Air is injected into the base of the column and then vented using a latching solenoid valve. This "shaking" action increases the contact between the two liquid phases in the column. The existing analog speed controllers can vary the pulse rate from 0 to 100 pulses per minute. The controllers are nonlinear, and replacement with digital controllers is desired. Simulator tests, however, showed erratic results when a digital controller was used. This was traced to the scan time of the controller. The 0.1 second scan rate of the controller, although fast enough to control at 100 pulses per minute, could not handle small setpoint changes. This was especially true at the high end of the range, and was due to the integer relationship created by the scan time. Using a controller specially modified to scan every 0.01 second will lessen the problem. This experience has shown that resolution, as well as maximum rate, should be considered when specifying scan rates requirements for digital controllers.

23146 (WHC-SD-CP-OTR–152) **Closed loop cooling operation with MICON.** Navarro, G.E. Westinghouse Hanford Co., Richland, WA (United States). 11 May 1995. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012580. Source: OSTI; NTIS; INIS; GPO Dep.

This Operability Test Procedure (OTP) provides instructions for testing the Closed Loop Cooling System interface with the MICON Terminal at the Plutonium Finishing Plant located at the 200 West Area of the Hanford Site. The Closed Loop Cooling System consists of several primary loops and a single secondary cooling loop. The test objectives are to functionally prove the interlocks and instruments of the closed loop cooling system with the MICON and to show operability of the system from the MICON Terminal. Any out of tolerance readings during the test will be adjusted immediately or with a new calibration package at a later time per cognizant engineers direction.

23147 (WHC-SD-CP-TP–085) **Test plan for anion exchange testing with Argonne 10-L solutions.** Compton, J.A. Westinghouse Hanford Co., Richland, WA (United States). 10 May 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012579. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this test plan is to determine the performance characteristics of four anion exchange resins. This information is required to scale up an ion exchange process for removing undesirable chemicals from calciner feed at PFP. The performance characteristics will be judged by comparing the total exchange capacity, the sorption and desorption of plutonium, the distribution coefficient, and other operating information in the presence of various complexing anions. The results will be compared to a similar process using organic extractants to determine the best way of removing the undesirable chemicals from the plutonium solutions.

23148 (ANL/ET/CP–83253) **Capabilities for spent fuel characterization at Argonne National Laboratory.** Neimark, L.A.; Strain, R.V. Argonne National Lab., IL (United States). Oct 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941207–37: Spent nuclear fuel meeting: challenges and initiatives, Salt Lake City, UT (United States), 14-16 Dec 1994). Order Number DE95012532. Source: OSTI; NTIS; INIS; GPO Dep.

Summaries of the status of spent nuclear fuel (SNF) owned by the Department of Energy have highlighted the need to obtain a better understanding of the current physical and chemical condition of the SNF as a foundation for establishing a clear path forward for the fuel's eventual geologic disposal in a long-term repository. To initiate obtaining the required information, DOE has generated an SNF Characterization Plan based on the needs for characterizing the materials stored at the individual major DOE storage sites. The principal focus of the plan is to characterize those fuel attributes that are key to the safe handling, transportation, and storage of the SNF. The drivers for specific attributes are regulatory requirements, resolution of technical issues, or a design need. Argonne National Laboratory's facilities in Illinois and Idaho possess capabilities that can be used to address many of the characterization issues that have been raised. This paper will describe these capabilities.

23149 (DOE/RW–0425-Suppl.) **Transportation system requirements document. Revision 1 DCN01. Supplement.** USDOE Office of Civilian Radioactive Waste Management, Washington, DC (United States). May 1995. 35p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95013315. Source: OSTI; NTIS; INIS; GPO Dep.

The original Transportation System Requirements Document described the functions to be performed by and the technical requirements for the Transportation System to transport spent nuclear fuel (SNF) and high-level radioactive waste (HLW) from Purchaser and Producer sites to a Civilian Radioactive Waste Management System (CRWMS) site, and between CRWMS sites. The purpose of that document was to define the system-level requirements. These requirements include design and operations requirements to the extent they impact on the development of the physical segments of Transportation. The document also presented an overall description of Transportation, its functions, its segments, and the requirements allocated to the segments and the system-level interfaces with Transportation. This revision of the document contains only the pages that have been modified.

23150 (ORNL/TM–13012) **Prediction of external corrosion for UF_6 cylinders: Results of an empirical method.** Lyon, B.F. Oak Ridge National Lab., TN (United States). Jun 1995. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95014488. Source: OSTI; NTIS; INIS; GPO Dep.

Wall thickness data for depleted LTF, (DU) cylinders in above-ground storage at three Department of Energy (DOE) sites (Oak Ridge, TN; Paducah, KY; Portsmouth, OH) were analyzed in order to address the following questions: How many cylinders may have breaches now? and, What will the conditions be like in 2020? This report summarizes preliminary results of the analyses conducted. These results are to be used as input into models for estimating risks and hazards associated with the cylinders in the various conditions. These models will then be used as a basis for implementing engineering fixes where possible and for management decisions on corrective actions. This is part of the overall assessment of the risks and hazards within the DU management program.

23151 (WHC-SD-FF-CSER–004) **Criticality safety evaluation for long term storage of FFTF fuel in interim storage casks.** Richard, R.F. Westinghouse Hanford Co., Richland, WA (United States). 11 May 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012576. Source: OSTI; NTIS; INIS; GPO Dep.

It has been postulated that a degradation phenomenon, referred to as "hot cell rot", may affect irradiated FFTF mixed plutonium-uranium oxide (MOX) fuel during dry interim storage. "Hot cell rot" refers to a variety of phenomena that degrade fuel pin cladding during exposure to air and inert gas environments. It is thought to be a form of caustic stress corrosion cracking or environmentally assisted cracking. Here, a criticality safety analysis was performed to address the effect of the "hot cell rot" phenomenon on the long term storage of irradiated FFTF fuel in core component containers. The results show that seven FFTF fuel assemblies or six Ident-69 pin containers stored in core component containers within interim storage casks will remain safely subcritical.

23152 (WHC-SD-SNF-ATR–005) **105-KE Isolation Barrier Leak Rate Acceptance Test Report.** McCracken, K.J. Westinghouse Hanford Co., Richland, WA (United States). 14 Jun 1995. 182p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015655. Source: OSTI; NTIS; INIS; GPO Dep.

This Acceptance Test Report (ATR) contains the completed and signed Acceptance Procedure (ATP) for the 105-KE Isolations Barrier Leak Rate Test. The Test Engineer's log, the completed sections of the ATP in the Appendix for Repeat Testing (Appendix K), the approved WHC J-7s (Appendix H), the data logger files (Appendices T and U), and the post test calibration checks (Appendix V) are included.

23153 (WHC-SD-SNF-DQO–004) **Data quality objectives for the initial fuel conditioning examinations.** Lawrence, L.A. Westinghouse Hanford Co., Richland, WA (United States). 23 May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014310. Source: OSTI; NTIS; INIS; GPO Dep.

The Data Quality Objectives (DQOs) were established for the response of the first group of fuel samples shipped from the K West Basin to the Hanford 327 Building hot cells for examinations to the proposed Path Forward conditioning process. Controlled temperature and atmosphere furnace testing testing will establish performance parameters using the conditioning process (drying, sludge drying, hydride decomposition passivation) proposed by the Independent Technical Assessment (ITA) Team as the baseline.

23154 (WHC-SD-SNF-DTP–001) **Test procedure for the Master-Lee and the modified Champion four inch hydraulic cutters.** Crystal, J.B. Westinghouse Hanford Co., Richland, WA (United States). 2 May 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012569. Source: OSTI; NTIS; INIS; GPO Dep.

The Master-Lee and the modified Champion 4 Inch hydraulic cutters are being retested to gather and document information related to the following: determine if the Master-Lee cutters will cut the trunnions of an Aluminum fuel canister and a Stainless Steel fuel canister; determine if the Master-Lee cutters will cut $1\frac{1}{2}$ inch diameter fire hose; determine if the modified Champion 4 inch blade will cut sections of piping; and determine the effectiveness of the centering device for the Champion 4 Inch cutters. Determining the limitations of the hydraulic cutter will aid in the process of debris removal in the K-Basin. Based on a previous test, the cutters were returned to the manufacturer for modifications. The modifications to the Champion 4 Inch Cutter and further testing of the Master-Lee Cutter are the subjects of these feature tests.

23155 (WHC-SD-SNF-SP–001) **Westinghouse Hanford Company recommended strategy for K Basin sludge disposition.** Alderman, C.J. Westinghouse Hanford Co., Richland, WA (United States). 1 May 1995. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012570. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this document is to present the recommended strategy for removal of sludges from the K Basins. This document ties sludge removal activities to the plan for the K Basin spent nuclear fuel (SNF) described in WHC-EP-0830, Hanford Spent Nuclear Fuel Project Recommended Path Forward and is consistent with follow-on direction provided in February 1995. Solutions and processes for resolving sludge removal technical and management issues to meet accelerated K Basin deactivation objectives are described. The following outlines the major elements of the recommendation: (1) manage all sludges as SNF while in the K Basins; (2) once loose sludges are collected and removed from the facilities, manage them as radioactive or mixed waste consistent with the upcoming characterization results, the preferred sludge path forward alternative sends sludges to the Tank Waste Remediation System (TWRS) and/or the Hanford Solid Waste Disposal as appropriate; (3) continue to manage sludge within the fuel canisters at the time they are loaded into the multi-canister overpacks as SNF.

23156 (WHC-SD-TP-SWD–002-Rev.2) **Automated Transportation Management System (ATMS) Software Project Management Plan (SPMP). Revision 2.** Weidert, R.S. Westinghouse Hanford Co., Richland, WA (United States). 26 May 1995. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014432. Source: OSTI; NTIS; INIS; GPO Dep.

As a cabinet level federal agency with a diverse range of missions and an infrastructure spanning the United States, the US Department of Energy (DOE) has extensive freight transportation requirements. Performance and management of this freight activity is a critical function. DOE's Transportation Management Division (TMD) has an agency-wide responsibility for overseeing transportation activities. Actual transportation operations are handled by government or contractor staff at the field locations. These staff have evolved a diverse range of techniques and procedures for performing transportation functions. In addition to minimizing the economic impact of transportation on programs, facility transportation staff must be concerned with the increasingly complex task of complying with complex shipment safety regulations. Maintaining the department's safety record for shipping hazardous and radioactive materials is a primary goal. Use of automation to aid transportation functions is not widespread within DOE, though TMD has a number of software systems designed to gather and analyze data pertaining to field transportation activities. These systems are not integrated. Historically, most field facilities have accomplished transportation-related tasks manually or with minimal computer assistance. At best, information and decision support systems available to transportation staffs within the facilities are fragmented. In deciding where to allocate resources for automation, facility managers have not tended to give the needs of transportation departments a high priority. This diversity causes TMD significant difficulty in collecting data for use in managing department-wide transportation activities.

23157 (WHC-SD-W236A-DA–002) **Stress analysis of single port (ISB) jumper connectors for 2-, 3-, and 4-in. sizes.** Islam, M.A. (ICF Kaiser Hanford Co., Richland, WA (United States)); Julyk, J.L.; Weiner, E.O. Westinghouse Hanford Co., Richland, WA (United States); ICF Kaiser Hanford Co., Richland, WA (United States). 26 May 1995. 652p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014428. Source: OSTI; NTIS; INIS; GPO Dep.

Jumper connectors are used in the Hanford site for remotely connecting jumper pipe lines in the radioactive zones. The jumper pipes are used for transporting radioactive fluids and hazardous chemicals. This report evaluates the adequacy and the integrity of the 2-, 3-, and 4-in. single-port integral seal block (ISB) jumper connector assemblies, as well as the three-way 2-in. configuration. The evaluation considers limiting forces from the piping to the nozzle. A stress evaluation of the jumper components (hook, hook pin, operating screw, nozzle and nozzle flange, and block) under operational (pressure, thermal, dead weight, and axial torquing of the jumper) and seismic loading is addressed in the report.

23158 (WHC-SD-WM-MAR–007) **Waste Encapsulation and Storage Facility mission analysis report.** Lund, D.P. Westinghouse Hanford Co., Richland, WA (United States). 24 May 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013879. Source: OSTI; NTIS; INIS; GPO Dep.

This report defines the mission for the Waste Encapsulation and Storage Facility (WESF). It contains summary information regarding the mission analysis which was performed by holding workshops attended by relevant persons involved in the WESF operations. The scope of the WESF mission is to provide storage of Cesium (Cs) and Strontium (Sr) capsules, previously produced at WESF, until every capsule has been removed from the facility either to another storage location, for disposal or for beneficial use by public or private enterprises. Since the disposition of the capsules has not yet been determined, they may be stored at WESF for many years, even decades. The current condition of the WESF facility must be upgraded and maintained to provide for storage which is safe, cost effective, and fully compliant with DOE direction as well as federal, state, and local laws and regulations. The Cs capsules produced at WESF were originally released to private enterprises for uses such as the sterilization of medical equipment; but because of the leakage of one capsule, all are being returned. The systems, subsystems, and equipment not required for the storage mission will be available for use by other projects or private enterprises. Beyond the storage of the Cs and Sr capsules, no future mission for the WESF has been identified.

23159 (ANL–95/7) **Surveillance of Site A and Plot M report for 1994.** Golchert, N.W. Argonne National Lab., IL (United States). May 1995. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95013276. Source: OSTI; NTIS; INIS; GPO Dep.

The results of the environmental surveillance program conducted at Site A/Plot M in the Palos Forest Preserve area for 1994 are presented. The surveillance program is the ongoing remedial action that resulted from the 1976-1978 radiological characterization of the site. That study determined that very low levels of hydrogen-3 (as tritiated water) had migrated from the burial ground and were present in two nearby hand-pumped picnic wells. The current program consists of sample collection and analysis of air, surface and

subsurface water, and bottom sediment. The results of the analyses are used to (1) monitor the migration pathway of water from the burial ground (Plot M) to the hand-pumped picnic wells, (2) establish if buried radionuclides other than hydrogen-3 have migrated, and (3) generally characterize the radiological environment of the area. Hydrogen-3 in the Red Gate Woods picnic wells was still detected this year, but the average and maximum concentrations were significantly less than found earlier. Tritiated water continues to be detected in a number of wells, boreholes, dolomite holes, and a surface stream. For many years it was the only radionuclide found to have migrated in measurable quantities. Analyses since 1984 have indicated the presence of low levels of strontium-90 in water from a number of boreholes next to Plot M. The available data does not allow a firm conclusion as to whether the presence of this nuclide represents recent migration or movement that may have occurred before Plot M was capped. The results of the surveillance program continue to indicate that the radioactivity remaining at Site A/Plot M does not endanger the health or safety of the public visiting the site, using the picnic area, or living in the vicinity.

23160 (ANL/CMT/CP–84524) **Laboratory testing of West Valley reference 6 glass.** Ebert, W.L. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950401–13: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 may 1995). Order Number DE95014235. Source: OSTI; NTIS; INIS; GPO Dep.

A series of laboratory tests is being conducted to characterize the corrosion of West Valley reference 6 glass (WV6) and to provide parametric values for modeling its long-term durability. Models require measurement of the corrosion rate in the absence of corrosion products and in fluids that are "saturated" with corrosion products, and the identification of alteration phases. Corrosion rates in dilute and saturated conditions were measured using MCC-1 and PCT tests, respectively. Vapor hydration tests were performed to generate secondary phases. The PCT tests show the WV6 glass to be more durable than SRL EA, SRL 202, and HW-39-1 glasses. Vapor hydration tests show weeksite (a uranyl silicate), a potassium-bearing zeolite, analcime, potassium feldspar, a calcium silicate phase, and lithium phosphate to form as WV6 glass corrodes. Test results are presented and their relevance to long-term performance discussed.

23161 (ANL/CMT/CP–84526) **Long-term performance of glasses for Hanford low-level waste.** Bakel, A.J. (Argonne National Lab., IL (United States)); Ebert, W.L.; Luo, J.S. Argonne National Lab., IL (United States); Pacific Northwest Lab., Richland, WA (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38 ; AC06-76RL01830. (CONF-950401–15: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 may 1995). Order Number DE95013781. Source: OSTI; NTIS; INIS; GPO Dep.

The long-term performance of glasses developed for stabilizing Hanford low-level radioactive waste is being assessed using static leach tests conducted for up to one year and under conditions that accelerate Corrosion. These tests support development of durable waste-form compositions and application of performance assessment models. Static leach tests were run with crushed glass at glass surface area/solution volume ratios of 2000 and 20,000 m^{-1} and temperatures of 20, 40, 70, and 90°C. All tests showed sodium to be released from the glass faster than boron or silicon. These results are interpreted in terms of the glass structure, the corrosion mechanism, and the effects of time, glass surface area/leachant volume ratio and temperature. Vapor hydration tests were conducted at elevated temperatures (70-200°C) using glasses containing various amounts of SiO_2, Na_2O, B_2O_3, CaO, and Al_2O_3. The response of a glass in these tests is relevant to its durability over very long disposal times. Different responses were observed in the tests: some glasses completely corroded within a few days while others were only slightly corroded. Corrosion led to the formation of analcime and gobbinsite; the corrosion rate increased significantly after these phases formed implications of these test results for the long-term glass durability are discussed.

23162 (ANL/CMT/CP–84590) **Performance of high plutonium-containing glasses for the immobilization of surplus fissile materials.** Bates, J.K.; Emery, J.W.; Hoh, J.C.; Johnson, T.R. Argonne National Lab., IL (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950401–16: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 may 1995). Order Number DE95013773. Source: OSTI; NTIS; INIS; GPO Dep.

Plutonium from dismantled weapons is being evaluated for geological disposal. While a final waste form has not been chosen, borosilicate glass will be one of the waste forms to be evaluated. The reactivity of the reference blend glass containing the standard amount of Pu (~0.01 wt %) to be produced by the Defense Waste Processing Facility (DWPF) is compared to that of glasses made from the same nominal frit composition but doped with 2 and 7 wt % Pu, and also equal mole percentages of Gd_2O_3. The Gd is added to act as a neutron poison to address criticality concerns. The four different glasses have been reacted using the PCT-B method with a SA/V of 20,000 m^{-1} and the Argonne Vapor Hydration Test (VHT) method. Both test methods accelerate the reaction of the glass. PCT-B is used to determine the reactivity of the glass by analyzing the solution and reacted test components, while the VHT is used to evaluate the long-term reactivity of the glass and the distribution of Pu to secondary phases that will control the long-term reaction of the glass. The results of the tests with high levels of Pu are compared to those with the nominal levels to be produced in the standard DWPF glass.

23163 (ANL/CMT/CP–84591) **Long-term test results from a West Valley actinide-doped reference glass.** Fortner, J.A.; Gerding, T.J.; Bates, J.K. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950401–20: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 may 1995). Order Number DE95013693. Source: OSTI; NTIS; INIS; GPO Dep.

Results from drip tests designed to simulate unsaturated conditions in the proposed Yucca Mountain Repository are reported for an actinide-doped glass (reference glass ATM-10) used as a model waste form. These tests have been ongoing for nearly 7 years, with data collected on solution composition (including transuranics), colloid formation and disposition, glass corrosion layers, and solid secondary phases. This test is unique because of its long elapsed time, high content of thorium and transuranics, use of actual groundwater from the proposed site area, use of contact between the glass and sensitized stainless steel in the test, and the variety of analytical procedures applied to the components. Some tests have been terminated, and scanning electron microscopy (SEM) and analytical transmission electron microscopy (AEM) were used to directly measure glass corrosion and identify secondary phases. Other tests remain ongoing, with periodic sampling of the water that had contacted the glass. The importance of integrated testing has been demonstrated, as complex interactions between the glass, the groundwater, and the sensitized stainless steel have been observed. Secondary phases include smectite clay, iron silicates, and brockite. Actinides, except neptunium, concentrate into stable secondary phases. The release of actinides is then controlled by the behavior of these phases.

23164 (ANL/CMT/CP–84717) **Microscopic characterization of crystalline phases in waste forms.** Buck, E.C. (Argonne National Lab., IL (United States)); Dietz, N.L.; Wronkiewicz, D.J.; Bates, J.K.; Millar, A. Argonne National Lab., IL (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950401–10: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 may 1995). Order Number DE95013890. Source: OSTI; NTIS; INIS; GPO Dep.

Transmission electron microscopy (TEM) has been used to determine the microstructure of crystalline phases present in zirconium- and titanium-bearing glass crystalline composite (GCC) waste forms. The GCC materials were found to contain spinels (maghemite), zirconolites, perovskites ($CaTiO_3$) and plagioclase feldspar (anorthite) mineral phases. The structure of the uranium

and cerium-bearing monoclinic zirconolite was characterized by medium resolution TEM imaging and electron and X-ray diffraction (XRD). The phase was found to contain high levels of iron in comparison to Synroc-type zirconolites. Excess zirconium in zirconolite has resulted in martensitic baddeleyite (ZrO_2) formation. Anorthite ($CaAl_2Si_2O_8$) was present as elongated crystallites within a calcium-rich aluminosilicate glass. Lead and iron-bearing anorthite lying along distinct precipitates were occasionally observed within the an crystallographic planes.

23165 (ANL/CMT/CP–86025) **Quantitative SEM/EDS analysis of high-level waste glasses.** Luo, J.S. (and others); Wolf, S.; Ebert, W. Argonne National Lab., IL (United States). Mar 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950865–4: 29. annual meeting of the Microbeam Analysis Society, Breckenridge, CO (United States), 6-11 Aug 1995). Order Number DE95014080. Source: OSTI; NTIS; INIS; GPO Dep.

Silicate glass will be used to stabilize high-level radioactive wastes (HLW) for disposal in a geological repository. The chemical durability of waste glass in the repository will be determined by the nature and progress of the glass-water (underground water) reaction. Aqueous corrosion of HLW glasses is known to result in the chemical alteration of the glass surface and the formation of secondary phases. Accurate quantitative analysis the altered glass surface and the reaction products that form is important for understanding the reaction kinetics and mechanism of glass corrosion. SEM/EDS is a powerful tool to study the alteration of waste-disposal glasses through quantitatively characterizing the reaction products. It is able to detect trace elements at concentrations less than 1 wt.%: for example, Fig. 1 shows the uranium peaks detected by SEM/EDS of a typical simulated waste glass, which contains 0.25 wt.% uranium in the matrix glass according to ICP/MS analysis. Nickel (0.44 wt.%) and chromium (0.47 wt.%) peaks are also clearly distinguishable in the spectrum. However, quantitative analyses of glass compositions are complicated by the lack of well-characterized reference samples having known and homogeneous compositions for candidate waste glasses, which may contain a combination of more than 20 different elements in one matrix. It has been proposed that unreacted glass with known compositions could satisfactorily serve as standards for quantitative analysis of waste-disposal glasses and the secondary phases. The main advantage of using such standards is that they contain all the elements to be analyzed in the homogeneous vitreous matrices. In this paper, we evaluate several reference waste glasses with respect to their suitability as standard samples for quantitative SEM/EDS analysis. The precision and accuracy using such standards for quantitative analysis are also discussed. All the experiments were carried out on a Topeon ABT 60 SEM operating at 20 kV.

23166 (ANL/CMT/CP–86433) **Developing innovative environmental technologies for DOE needs.** Devgun, J.S. (Argonne National Lab., IL (United States)); Sewell, I.O.; DeGregory, J. Argonne National Lab., IL (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950729–7: 30. Intersociety energy conversion conference, Orlando, FL (United States), 30 Jul - 5 aug 1995). Order Number DE95014242. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental restoration and waste management activities at US Department of Energy (DOE) facilities are diverse and complex. Contamination at DOE sites and facilities includes radionuclides, chlorinated hydrocarbons, volatile organic compounds, non-aqueous phase liquids, and heavy metals, among others. Soil and groundwater contamination are major areas of concern and DOE has focused very significant efforts in these areas. Relevant technology development activities are being conducted at DOE's own national laboratories, as well as through collaborative efforts with other federal agencies and the private sector. These activities span research and development (R&D) of new concepts and techniques to demonstration and commercialization of mature technologies. Since 1990, DOE has also supported R&D of innovative technologies through interagency agreements with US Environmental Protection Agency (EPA), US Department of Defense, the National Science Foundation, and others.

23167 (ANL/EA/CP–84766) **Facility accident considerations in the US Department of Energy Waste Management Program.** Mueller, C. Argonne National Lab., IL (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-941102–45: Winter meeting of the American Nuclear Society, Washington, DC (United States), 13-18 Nov 1994). Order Number DE95011818. Source: OSTI; NTIS; INIS; GPO Dep.

A principal consideration in developing waste management strategies is the relative importance of Potential radiological and hazardous releases to the environment during postulated facility accidents with respect to protection of human health and the environment. The Office of Environmental Management (EM) within the US Department of Energy (DOE) is currently formulating an integrated national program to manage the treatment, storage, and disposal of existing and future wastes at DOE sites. As part of this process, a Programmatic Environmental impact Statement (PEIS) is being prepared to evaluate different waste management alternatives. This paper reviews analyses that have been Performed to characterize, screen, and develop source terms for accidents that may occur in facilities used to store and treat the waste streams considered in these alternatives. Preliminary results of these analyses are discussed with respect to the comparative potential for significant releases due to accidents affecting various treatment processes and facility configurations. Key assumptions and sensitivities are described.

23168 (ANL/EQO/VU–86239) **Argonne National Laboratory Internal Appraisal Program environment, safety, health/quality assurance oversight.** Winner, G.L.; Siegfried, Y.S.; Forst, S.P.; Meshenberg, M.J. Argonne National Lab., IL (United States). [1995]. 86p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9505225–Summ.: 8. semiannual environmental, safety, and health coordination meeting, Gaithersburg, MD (United States), 23-25 May 1995). Order Number DE95013412. Source: OSTI; NTIS; GPO Dep.

Argonne National Laboratory's Internal Appraisal Program has developed a quality assurance team member training program. This program has been developed to provide training to non-quality assurance professionals. Upon successful completion of this training and approval of the Internal Appraisal Program Manager, these personnel are considered qualified to assist in the conduct of quality assurance assessments. The training program has been incorporated into a self-paced, computerized, training session.

23169 (ANL/EWM/CP–82616) **Preliminary investigation of the 317 Area, ANL-E.** Wescott, J. (Argonne National Lab., IL (United States)); Moos, L.; Remeikis, A. Argonne National Lab., IL (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950225–2: Geoenvironment 2000 meeting, Baton Rouge, LA (United States), 22-24 Feb 1995). Order Number DE95012940. Source: OSTI; NTIS; INIS; GPO Dep.

The 317 Area at Argonne National Laboratory-East (ANL-E) is scheduled to undergo a Resource Conservation and Recovery Act (RCRA) Facility Investigation, Act or RFI. Prior to the formal RFI, a voluntary, preliminary characterization of the 317 Area was conducted by ANL-E. The characterization results were used to formulate the RFI work plan and provided a better focus for the formal investigation. This site presents a difficult engineering challenge. The nature of the waste disposed at this site in the past includes both liquid chemicals and radioactive waste. The 317 Area is classified as a radiologically controlled area because of operations currently performed there. Present Department of Energy policy stipulates that waste material from such an area must be considered radioactive. The possible presence of hazardous constituents in the soil and groundwater would require the investigation-derived waste generated at the site be disposed as radioactive mixed waste. Besides the nature of the waste possibly contaminating this site, the geology of the site poses an equally enigmatic situation. The ANL-E site is located in a region of recessional glacial moraine deposits.

23170 (BNL–61647) **Nondestructive examination of DOE high-level waste storage tanks.** Bush, S.; Bandyopadhyay, K.;

Kassir, M.; Mather, B.; Shewmon, P.; Streicher, M.; Thompson, B.; van Rooyen, D.; Weeks, J. Brookhaven National Lab., Upton, NY (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950740–46: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95011776. Source: OSTI; NTIS; INIS; GPO Dep.

A number of DOE sites have buried tanks containing high-level waste. Tanks of particular interest am double-shell inside concrete cylinders. A program has been developed for the inservice inspection of the primary tank containing high-level waste (HLW), for testing of transfer lines and for the inspection of the concrete containment where possible. Emphasis is placed on the ultrasonic examination of selected areas of the primary tank, coupled with a leak-detection system capable of detecting small leaks through the wall of the primary tank. The NDE program is modelled after ASME Section XI in many respects, particularly with respects to the sampling protocol. Selected testing of concrete is planned to determine if there has been any significant degradation. The most probable failure mechanisms are corrosion-related so that the examination program gives major emphasis to possible locations for corrosion attack.

23171 (CAO–94-1010) **Transuranic Waste Characterization Quality Assurance Program Plan.** USDOE Carlsbad Area Office, NM (United States). 30 Apr 1995. 258p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012993. Source: OSTI; NTIS; INIS; GPO Dep.

This quality assurance plan identifies the data necessary, and techniques designed to attain the required quality, to meet the specific data quality objectives associated with the DOE Waste Isolation Pilot Plant (WIPP). This report specifies sampling, waste testing, and analytical methods for transuranic wastes.

23172 (CONF-950570–21) **Continuous, environmental radon monitoring program at the Yucca Mountain Site Characterization Project.** Liu, N.; Sorensen, C.D.; Tung, C.H.; Orchard, C.R. Science Applications International Corp., Las Vegas, NV (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-87NV10576. From International high-level radioactive waste management conference: progress toward understanding; Las Vegas, NV (United States); 1-5 May 1995. Order Number DE95012123. Source: OSTI; NTIS; INIS; GPO Dep.

A continuous, environmental radon monitoring program has been established in support of the Department of Energy's (DOE) Yucca Mountain Site Characterization Project (YMP). The monitoring program is to characterize the natural radon emissions at the YMP site, to understand the existing radon concentrations in the environmental background, and to assess and control the potential work exposure. Based upon a study of the monitoring results, this paper presents a preliminary understanding of the magnitudes, characteristics, and exposure levels of radon at the YMP site.

23173 (CONF-950570–24) **Anisotropy of mechanical properties of tuff at Yucca Mountain.** Karakouzian, M.; Hudyma, N. Nevada Univ., Las Vegas, NV (United States). [1995]. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC08-90NV10872. From International high-level radioactive waste management conference: progress toward understanding; Las Vegas, NV (United States); 1-5 May 1995. Order Number DE95013014. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this study is to investigate anisotropy of mechanical properties, namely, compressive strength and modulus, for Tiva Canyon welded tuff from the starter tunnel at Yucca Mountain. Mechanical properties of Tiva Canyon Tuff are needed for the design of the ramps and drifts within the Tiva Canyon horizon. Approximately one cubic foot block samples, all of which were from the thermo – mechanical unit TCw, were obtained from a muck pile containing excavated rock from the starter tunnel. Specimens were cored from the block samples in two distinct orientations: parallel and perpendicular to the lithophysal cavity orientation. Since lithophysal cavity orientation is predominantly horizontal in the field, parallel specimens can be considered horizontal and perpendicular specimens vertical with respect to the rock mass. The specimens were NX sized (5.4 cm diameter) and had a length-to-diameter ratio of 2:1. The air dried specimens were tested at room temperature in a triaxial chamber at confining pressures of 0.1, 5, and 10 MPa, and at a compressive axial strain rate of 10^{-5} s^{-}. The Young's Modulus values were calculated by a least squares fit of stress - strain data between 10 and 50% of the ultimate strength.

23174 (CONF-9505101–5) **Waste processing demonstrations within the Waste Pretreatment and Processing Program of the Tank Focus Area.** Hunt, R.D.; McGinnis, C.P. Oak Ridge National Lab., TN (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Conference on challenges and innovations in the management of hazardous waste; Washington, DC (United States); 10-12 May 1995. Order Number DE95013984. Source: OSTI; NTIS; INIS; GPO Dep.

US Department of Energy (DOE) Office of Environmental Management has created a new approach for the development of technology for DOE environmental remediation problems. Previously, technology development was conducted on a site-by-site basis and managed by multiple organizations. This new DOE strategy consolidates and focuses all technology development efforts on five priority problems. The remediation of the 1×10^8 gal of radioactive waste in the underground storage tanks (USTs) at five DOE sites is one of the priority problems. All tank remediation projects will be integrated into the Tank Focus Area (TFA). The TFA mission is to manage an integrated technology development program that results in the safe and efficient remediation of UST waste across the DOE complex. The TFA has divided its efforts into several areas such as safety, characterization, retrieval, pretreatment and processing, immobilization, and site closure. A key predecessor of the Waste Pretreatment and Processing Program (WPPP) of the TFA was the Waste Processing and Disposal Program (WPDP) of the Underground Storage Tank – Integrated Demonstration. Nearly all of the FY 1995 WPDP projects have been transferred into the WPPP. These WPPP projects can be divided into four systems: cesium removal, comprehensive sludge and supernate, out-of-tank evaporation, and cross-flow filtration. The current status of these WPPP projects is presented. The goal of the projects is to minimize the volume of high-level waste and the radioactivity in low-level waste.

23175 (CONF-9505101–6) **Removal of technetium from alkaline nuclear-waste media by a solvent-extraction process using crown ethers.** Bonnesen, P.V. (Oak Ridge National Lab., TN (United States). Chemical and Analytical Sciences Div.); Presley, D.J.; Haverlock, T.J.; Moyer, B.A. Oak Ridge National Lab., TN (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Conference on challenges and innovations in the management of hazardous waste; Washington, DC (United States); 10-12 May 1995. Order Number DE95014200. Source: OSTI; NTIS; INIS; GPO Dep.

Crown ethers dissolved in suitably modified aliphatic kerosene diluents can be employed to extract technetium as pertechnetate anion (TcO_4^-) with good extraction ratios from realistic simulants of radioactive alkaline nitrate waste. The modifiers utilized are non-halogenated and non-volatile, and the technetium can be removed from the solvent by stripping using water. The crown ethers bis-4,4′(5′)[(tert-butyl)cyclohexano]-18-crown-6 (di-t-BuCH18C6) and dicyclohexano-18-crown-6 (DCH18C6) provide stronger TcO_4^- extraction than dicyclohexano-21-crown-7 and 4-tert-butylcyclohexano 15-crown-5. Whereas DCH18C6 provides somewhat higher TcO_4^- extraction ratios than the more lipophilic di-t-BuCH18C6 derivative, the latter was selected for further study owing to its lower distribution to the aqueous phase. Particularly good extraction and stripping results were obtained with di-t-BuCH 18C6 at 0.02 M in a 2:1 vol/vol blend of tributyl phosphate and Isopar® M. Using this solvent, 98.9% of the technetium contained (at 6×10^{-5} M) in a Double-Shell Slurry Feed (DSSF) Hanford tank waste simulant was removed following two cross-current extraction contacts. Two cross-current stripping contacts with deionized water afforded removal of 99.1% of the technetium from the organic solvent.

23176 (CONF-9505217–2) **Using systems analysis to improve decision making in solving mixed waste problems at the Oak Ridge National Laboratory.** Ferrada, J.J.; Welch, T.D.;

Osborne-Lee, I.W.; Nehls, J.W. Jr. Oak Ridge National Lab., TN (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Air & Waste Management Association Policy meeting; Washington, DC (United States); 10-12 May 1995. Order Number DE95013201. Source: OSTI; NTIS; INIS; GPO Dep.

Systems analysis methods and tools have been developed and applied to the problem of selecting treatment technologies for mixed wastes. The approach, which is based on decision analysis, process modeling, and process simulation with a tool developed in-house, provides a one-of-a-kind resource for waste treatment alternatives evaluation and has played a key role in developing mandated treatment plans for Oak Ridge Reservation mixed waste.

23177 (CONF-9510125–1) **In situ techniques for the characterization and monitoring of a radioactively contaminated site for in situ vitrification.** Cline, S.R.; Bogle, M.A.; Spalding, B.P.; Naney, M.T. Oak Ridge National Lab., TN (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International symposium on environmental technologies: plasma systems and applications; Atlanta, GA (United States); 8-11 Oct 1995. Order Number DE95012896. Source: OSTI; NTIS; INIS; GPO Dep.

A treatability study was in October 1993 to evaluate the application of in situ vitrification (ISV) to an old seepage pit used for the disposal of radioactive liquid waste at the Oak Ridge National Laboratory (ORNL). This pit is one of seven inactive seepage pits and trenches at ORNL. During the 3 months that the pit was operated as a disposal facility, it is estimated to have received approximately 398 curies of mixed fission products, primarily ^{137}Cs, ^{90}Sr, and ^{106}Ru. Based on data from analysis of sludge from another pit, the activities for waste sludge in Pit 1 decay corrected to 1993 have been roughly estimated to be 71 and 17.5 curies of ^{137}Cs, and ^{90}Sr, respectively. The ^{106}Ru, with a half-life of 367 days, has decayed completely in the 42 years since its disposal in the pit Earthen fill material was added to the pit in 1981, and the pit area was then covered with an approximately 4–6 inch thick asphalt surface. Because so little information necessary for the effective and safe ISV of Pit 1 was available, the first phasm of the treatability study focused on site characterization activities. Several in-situ techniques were developed and used during characterization to ascertain the pit's lateral and vertical dimensions hydraulic and hydrologic properties, soil composition, contaminant inventory, and lateral and vertical distribution of radionuclides. At the end of the treatability study, this characterization effort will be evaluated to determine which properties were the most useful for designing and controlling the ISV process. Such information will be invaluable in efficiently and safely gathering characterization data for the remediation of the other seepage pits and trenilim at ORNL via ISV or alternative remediation techniques. This abstract briefly describes some of the major components of the field characterization activities and their results.

23178 (DOE/CAO–2056-Vol.1-Draft) **Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 1.** USDOE Carlsbad Area Office, NM (United States). 31 Mar 1995. 440p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE95012433. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Isolation Pilot Plant (WIPP) is a research and development facility for the demonstration of the permanent isolation of transuranic radioactive wastes in a geologic formation. The facility was constructed in southeastern New Mexico in a manner intended to meet criteria established by the scientific and regulatory community for the safe, long-term disposal of transuranic wastes. The US Department of Energy (DOE) is preparing an application to demonstrate compliance with the requirements outlined in Title 40, Part 191 of the Code of Federal Regulations (CFR) for the permanent disposal of transuranic wastes. As mandated by the Waste Isolation Pilot Plant (WIPP) Land Withdrawal Act of 1992, the US Environmental Protection Agency (EPA) must evaluate this compliance application and provide a determination regarding compliance with the requirements within one year of receiving a complete application. Because the WIPP is a very complex program, the DOE has planned to submit the application as a draft in two parts. This strategy will allow for the DOE and the EPA to begin technical discussions on critical WIPP issues before the one-year compliance determination period begins. This report is the first of these two draft submittals.

23179 (DOE/CAO–2056-Vol.2-Draft) **Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 2: Appendices, AAC, BECR, BH.** USDOE Carlsbad Area Office, NM (United States); Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. 31 Mar 1995. 906p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE95012436. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the conceptual design of a system the Department of Energy (DOE) may implement for compliance with the requirement to control access to the disposal site. In addition, this report addresses the scheduling process for control of inspection, maintenance, and periodic reporting related to Long Term Monitoring which addresses the monitoring of disposal system performance, environmental monitoring in accordance with the Consultation and Cooperation Agreement between the DOE and the state of New Mexico, and evaluation of testing activities related to the Permanent Marker System design. In addition to access control addressed by this report, the controlling or cleaning up of releases from the site is addressed in the Conceptual Decontamination and Decommissioning Plan. The monitoring of parameters related to disposal system performance is addressed in the Long Term Monitoring Design Concept Description. Together, these three documents address the full range of active institutional controls planned after disposal of the TRU waste in the WIPP repository.

23180 (DOE/CAO–2056-Vol.3-Draft) **Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 3: Appendix BIR Volume 1.** USDOE Carlsbad Area Office, NM (United States); Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. 31 Mar 1995. 559p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-93AL96904 ; AC04-86AL31950. (CAO–94-1005-Rev.1). Order Number DE95012437. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Isolation Pilot Plant (WIPP) Transuranic Waste Baseline Inventory Report (WTWBIR) establishes a methodology for grouping wastes of similar physical and chemical properties, from across the US Department of Energy (DOE) transuranic (TRU) waste system, into a series of "waste profiles" that can be used as the basis for waste form discussions with regulatory agencies. The majority of this document reports TRU waste inventories of DOE defense sites. An appendix is included which provides estimates of commercial TRU waste from the West Valley Demonstration Project. The WIPP baseline inventory is estimated using waste streams identified by the DOE TRU waste generator/storage sites, supplemented by information from the Mixed Waste Inventory Report (MWIR) and the 1994 Integrated Data Base (IDB). The sites provided and/or authorized all information in the Waste Stream Profiles except the EPA (hazardous waste) codes for the mixed inventories. These codes were taken from the MWIR (if a WTWBIR mixed waste stream was not in MWIR, the sites were consulted). The IDB was used to generate the WIPP radionuclide inventory. Each waste stream is defined in a waste stream profile and has been assigned a waste matrix code (WMC) by the DOE TRU waste generator/storage site. Waste stream profiles with WMCs that have similar physical and chemical properties can be combined into a waste matrix code group (WMCG), which is then documented in a site-specific waste profile for each TRU waste generator/storage site that contains waste streams in that particular WMCG.

23181 (DOE/CAO–2056-Vol.4-Draft) **Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 4: Appendix BIR Volume 2.** USDOE Carlsbad Area Office, NM (United States); Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. 31 Mar 1995. 704p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. (CAO–94-1005-Rev.1). Order Number DE95012754. Source: OSTI; NTIS; INIS; GPO Dep.

This report consists of the waste stream profile for the WIPP transuranic waste baseline inventory at Lawrence Livermore National Laboratory. The following assumptions/modifications were made by the WTWBIR team in developing the LL waste stream profiles: since only current volumes were provided by LL, the final form volumes were assumed to be the same as the current volumes; the WTWBIR team had to assign identification numbers (IDs) to those LL waste streams not given an identifier by the site, the assigned identification numbers are consistent with the site reported numbers; LL Final Waste Form Groups were modified to be consistent with the nomenclature used in the WTWBID, these changes included word and spelling changes, the assigned Final Waste Form Groups are consistent with the information provided by LL; the volumes for the year 1993 were changed from an annual rate of generation (m^3/year) to a cumulative value (m^3).

23182 (DOE/EM–0238) **Cost Quality Management Assessment for the Oakland Operations Office. Final report.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Office of Engineering and Cost Management. Jun 1995. 114p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95013582. Source: OSTI; NTIS; INIS; GPO Dep.

The prime contractor of Lawrence Livermore National Laboratory (LLNL), University of California, is responsible for conducting environmental restoration (ER) and waste management (WM) activities at LLNL under the direction of the Oakland Operations Office (DOE-OAK). This report examines the overall DOE-OAK and LLNL process with respect to cost quality management for EM-30, EM-40, and EM-60 activities. The Round II Cost Quality Management Assessment (CQMA) conducted October 17–28, 1994, reviewed DOE-LAK's cost and cost-related management practices against Performance Objective and Criteria (POCs) contained in the CQMA Handbook (Rev. 3). Three subteams (Cost- and Schedule-Estimating Process, Independent Cost Review, and Management and Technical Evaluation) conducted interviews and reviewed documentation to assess cost and cost-related practices associated with EM-30, -40, and -60 activities. The detailed reports of the subteams are presented in section III. Included in the appendices are organizational charts of the Oakland Operations Office and Lawrence Livermore National Laboratory.

23183 (DOE/EM–0249) **Efficient Separations and Processing Crosscutting Program. Technology summary.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Jun 1995. 101p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95016004. Source: OSTI; NTIS; INIS; GPO Dep.

The Efficient Separations and Processing (ESP) Crosscutting Program was created in 1991 to identify, develop, and perfect separations technologies and processes to treat wastes and address environmental problems throughout the DOE Complex. The ESP funds several multi-year tasks that address high-priority waste remediation problems involving high-level, low-level, transuranic, hazardous, and mixed (radioactive and hazardous) wastes. The ESP supports applied research and development (R and D) leading to demonstration or use of these separations technologies by other organizations within DOE-EM. Treating essentially all DOE defense wastes requires separation methods that concentrate the contaminants and/or purify waste streams for release to the environment or for downgrading to a waste form less difficult and expensive to dispose of. Initially, ESP R and D efforts focused on treatment of high-level waste (HLW) from underground storage tanks (USTs) because of the potential for large reductions in disposal costs and hazards. As further separations needs emerge and as waste management and environmental restoration priorities change, the program has evolved to encompass the breadth of waste management and environmental remediation problems.

23184 (DOE/MC/29249–4074) **Electromagnetic mixed-waste processing system for asbestos decontamination.** KAI Technologies, Inc., Woburn, MA (United States). Apr 1995. 136p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-94MC29249. Order Number DE95009720. Source: OSTI; NTIS; INIS; GPO Dep.

The first phase of a program to develop and demonstrate a cost-effective, integrated process for remediation of asbestos-containing material that is contaminated with organics, heavy metals, and radioactive compounds was successfully completed. Laboratory scale tests were performed to demonstrate initial process viability for asbestos conversion, organics removal, and radionuclide and heavy metal removal. All success criteria for the laboratory tests were met. (1) Ohio DSI demonstrated greater than 99% asbestos conversion to amorphous solids using their commercial process. (2) KAI demonstrated 90% removal of organics from the asbestos suspension. (3) Westinghouse STC achieved the required metals removal criteria on a laboratory scale (e.g., 92% removal of uranium from solution, resin loadings of 0.6 equivalents per liter, and greater than 50% regeneration of resin in a batch test.) Using the information gained in the laboratory tests, the process was reconfigured to provide the basis for the mixed waste remediation system. An integrated process is conceptually developed, and a Phase 2 program plan is proposed to provide the bench-scale development needed in order to refine the design basis for a pilot processing system.

23185 (DOE/RW/00134–T17) **Yucca Mountain Site Characterization Project technical data catalog quarterly supplement.** TRW, Inc., Fairfax, VA (United States). 31 Mar 1995. 179p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC01-91RW00134. Order Number DE95013073. Source: OSTI; NTIS; GPO Dep.

The Department of Energy (DOE)/Nuclear Regulatory Commission (NRC) Site-Specific Procedural Agreement for Geologic Repository Site Investigation and Characterization Program requires the DOE to develop and maintain a catalog of data which will be updated and provided to the NRC at least quarterly. This catalog is to include a description of the data; the time (date), place, and method of acquisition; and where the data may be examined. The Yucca Mountain Site Characterization Project (YMP) Technical Data Catalog is published and distributed in accordance with t requirements of the Site-Specific Agreement. The YMP Technical Data Catalog is a report based on reference information contained in the YMP Automated Technical Data Tracking System (ATDT). The reference information is provided by Participants for data acquired or developed in support of the YMP. The Technical Data Catalog is updated quarterly and distributed in the month following the end of each quarter. A complete revision to the catalog is published at the end of each fiscal year. Supplements to the end-of-year edition are published each quarter. These supplements provide information related to new data items not included in previous quarterly updates and data items affected by changes to@ previously published reference information. The Technical Data Catalog, dated September 30, 1994, should be retained as the baseline document for the supplements until the end-of-year revision is published and distributed in October 1995.

23186 (DOE/RW/00134–T19) **Technical Data Catalog: Yucca Mountain Site Characterization Project. Quarterly supplement.** USDOE Yucca Mountain Site Characterization Project Office, Las Vegas, NV (United States). 30 Jun 1995. 172p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC01-91RW00134. Order Number DE95015529. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents reference information contained in the Yucca Mountain Project Automated Technical Data Tracking System. The Department of Energy is seeking to design and maintain a geologic repository for the disposal of high-level radioactive wastes. However, before this repository can be built, the DOE must first do a comprehensive site evaluation. This evaluation is subject to many regulations. This report fulfills the reporting requirements of the Site-Specific Procedural Agreement for Geologic Repository to develop and maintain a catalog of data which will be updated and provided to the Nuclear Regulatory Commission on a quarterly basis. This catalog contains: description of data; time, place, and method of acquisition; and where data may be examined.

23187 (DOE/RW–0464) **Office of Civilian Radioactive Waste Management Fiscal Year 1994 annual report to Congress.** USDOE Office of Civilian Radioactive Waste Management, Washington, DC (United States). May 1995. 110p. Sponsored by

USDOE, Washington, DC (United States). Order Number DE95013657. Source: OSTI; NTIS; INIS; GPO Dep.

The events of Fiscal Year 1994 made it a notable year in OCRWN's history. Highlights include formulation of a new program approach; intensive consultation with other parties to build confidence in that approach; the delivery, assembly, and initial testing of the tunnel boring machine that is now digging into Yucca Mountain; steps toward acquisition of a standardized multipurpose canister system and planning for the accompanying environmental impact statement; and solicitation, through a Federal Register notice, of utilities' and other interested parties' recommendations toward resolving key waste-acceptance issues.

23188 (DOE/WIPP–94-011) **Brine Sampling and Evaluation Program 1992–1993 report and summary of BSEP data since 1982.** Deal, D.E. (I. T. Corp., Carlsbad, NM (United States)); Abitz, R.J.; Belski, D.S. USDOE Albuquerque Operations Office, Carlsbad, NM (United States). Waste Isolation Pilot Plant Project Office. Apr 1995. 293p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE95016694. Source: OSTI; NTIS; INIS; GPO Dep.

This report is the last one that is currently scheduled in the sequence of reports of new data, and therefore, also includes summary comments referencing important data obtained by BSEP since 1983. These BSEP activities document and investigate the origins, hydraulic characteristics, extent, and composition of brine occurrences in the Permian Salado Formation and seepage of that brine into the excavations at the (WIPP) Waste Isolation Pilot Plant. A project concern is that enough brine might be present after sealing and closure to generate large quantities of hydrogen gas by corroding the metal in the waste drums and waste inventory. This report describes progress made during the calendar years 1992 and 1993 and focuses on four major areas: (1) monitoring of brine inflow, e.g., measuring brines recovered from holes drilled downward from the underground drifts (downholes), upward from the underground drifts (upholes), and from subhorizontal holes from the underground drifts; (2) observations of weeps in the Air Intake Shaft (AIS); (3) further characterization of brine geochemistry; and (4) additional characterization of the hydrologic conditions in the fractured zone beneath the excavations.

23189 (EML–567) **Inventory of site-derived ^{36}Cl in the Snake River plain aquifer, Idaho National Engineering Laboratory, Idaho.** Beasley, T.M. Department of Energy, New York, NY (United States). Environmental Measurements Lab. Feb 1995. 51p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014966. Source: OSTI; NTIS; INIS; GPO Dep.

Radioactive waste management practices at the U.S. Department of Energy's Idaho National Engineering Laboratory (INEL) in Idaho have introduced ^{36}Cl ($T_{1/2}$ = 301,000 yr) into the Snake River Plain aquifer underlying the site. The ^{36}Cl is believed to originate from neutron activation of stable ^{35}Cl in nuclear fuels (principally) and in reactor cooling/process water. Wastewater releases of ^{3}H at the INEL have been documented by the site operators for the period 1952 to 1988. During this time, approximately 1.2 PBq of ^{3}H (30,000 Ci) were introduced to the subsurface through disposal wells and seepage ponds. By sampling a number of monitoring and production wells downgradient from points of introduction, ^{3}H movement and dispersion in the groundwater have been documented by the U.S. Geological Survey. The present report uses these historical ^{3}H release and monitoring data to choose hydrologic parameters (matrix porosity and plume penetration depth) that produce concordance between the ^{3}H release estimates and the inventory calculated from measurements of ^{3}H in the subsurface. These parameters are then applied to ^{36}Cl isopleths to generate an estimated ^{36}Cl inventory in the subsurface. Using assumptions about irradiation times, neutron fluxes, and total fuel processed, as little as 23 g of stable chloride impurity in fuel elements would be adequate to produce the amount of ^{36}Cl estimated to be in the groundwaters underlying the site. The highest atom concentration of ^{36}Cl measured onsite (222×10^{10} atoms l^{-1}) corresponds to an activity level of ~4 pCi l^{-1} and represents 0.2 percent of the U.S. Environmental Protection Agency's (EPA) drinking water standard for this radionuclide (2000 pCi l^{-1}).

23190 (ENRESA–03/95) **Thermo-hydro-mechanical characterization of the Spanish reference clay material for engineered barrier for granite and clay MLW repository: laboratory and small mock up testing.** Villar, M.V. No corporate text available. 1995. 120p. Order Number DE95789657. Source: OSTI; NTIS; INIS.

This report refers to the work carried out by Technic Geologic Division of CIEMAT (CIEMAT.DT.TG) coordinated by SCK/CEN (Belgium), participating besides UPC-DIT and University of Wales on the framework of CEC Contract F12W-CT91-0102 (DOEO). It presents the results obtained. The total results on the project will be published by CE in the EUR series. The role of CIEMAT in this project was to carry out tests in which the conditions of the clay barrier in the repository were simulated. The interaction of heat coming from the wastes and of water coming from the geological medium has been reproduced on compacted clay blocks. For the performance of tests on high density compacted clay blocks (Task 2.1) and for the cementation and chemical-mineralogical transformation studies two different cells were designed and constructed in stainless steel: a thermohydraulic cell and an alteration cell. The experiments performed in these cells have provided us with a better knowledge of the heat source, hydration system and sensors, as well as interesting data on heat and water diffusion. A revision of the experiments performed on the thermohydraulic cell was presented at the "International Workshop on Thermomechanics of Clays and Clay Barriers" held in Bergamo in October'93 (Villar et al. 1993).

23191 (ENRESA–04/95) **Synthesis report of geotechnic assessment to clay-AGP design: reference concept.** Fária, P.; Pedraza, L.; Ruiz, F. No corporate text available. 1995. 60p. (In Spanish). Order Number DE95789656. Source: OSTI; NTIS; INIS.

This report summarizes the studies on clays for the storage of radioactive wastes. The study is focussed to the geotechnical assessment for the clays. The report presents the methodology analysis, the geotechnical feasibility, minimizing methods, costs and operation.

23192 (ES/WM–30) **Oak Ridge Reservation Waste Management Plan.** Turner, J.W. (ed.). Oak Ridge National Lab., TN (United States). Feb 1995. 247p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/M–4090). Order Number DE95012970. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the waste management plan for the Oak Ridge Reservation facilities. The primary purpose is to convey what facilities are being used to manage wastes, what forces are acting to change current waste management systems, and what plans are in store for the coming fiscal year.

23193 (JAERI-Review–95-009) **Methodologies for measurement and application of distribution coefficient.** Uchida, Shigeo (National Inst. of Radiological Sciences, Hitachinaka, Ibaraki (Japan). Nakaminato Lab. Branch); Yasuda, Hiroshi; Mahara, Yasunori; Sasaki, Noriyuki; Takahashi, Tomoyuki; Kimura, Hideo; Matsuzuru, Hideo. Japan Atomic Energy Research Inst., Tokyo (Japan). Jun 1995. 72p. (In Japanese). Order Number DE95789395. Source: OSTI; NTIS; INIS.

The distribution coefficient, as an equilibrium parameter, which defines partitioning of a solute between a solid and liquid phase, is commonly used in safety assessment of nuclear waste disposal ; e.q., in (1) analysis of the release behavior of radionuclides from a repository (a source term analysis), (2) analysis of the migration behavior of radionuclides in the geosphere, and (3) analysis of the transport behavior of radionuclides in the biosphere. Since the distribution coefficient is utilized in analyses of essential components involved in a nuclear waste disposal system as mentioned above, one of important requirements is appropriate measurement and application of the distribution coefficient, particularly to ensure a credibility of safety assessment. Aiming at the recommendation of a standard methodology through studies on the methodologies for measurement and application of the distribution coefficient, the following issues are being discussed by 'WG on Parameters for Safety Assessment' of 'Technical Committee on Behavior of Environmental Radioactivity' which belongs to 'Research Committee on Environmental Radioactivity' organized by Japan Atomic Energy

Research Institute; Transport of radionuclides in environment, Theoretical aspects of the distribution coefficient, Application of the coefficient in safety assessment, State-of-the-art of methodologies to measure the coefficient, Review of the coefficient. The report entitled 'Methodologies for Measurement and Application of the Distribution Coefficient' summarizes the achievements of the WG in 1994, which were subject to a technical review by both the Research Committee on Environmental Radioactivity and the Technical Committee on Behavior of Environmental Radioactivity. (author).

23194 (KFK–5351) **Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB).** Pfeifer, W. (comp.). Kernforschungszentrum Karlsruhe GmbH (Germany). Hauptabteilung Dekontaminationsbetriebe. May 1994. 183p. (In German). (CONF-9308272–: Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB) at Kernforschungszentrum Karlsruhe GmbH (KfK), Karlsruhe (Germany), 26 Aug 1993). Order Number DE95796284. Source: OSTI; NTIS (US Sales Only); INIS.

The twelve seminar papers compiled in the KfK report deal with the current state of the art and the technology available in Germany for the management of radioactive liquid and solid wastes, and radioactive scrap. Some papers discuss particular technical aspects of techniques such as solidification, volume reduction, and compaction. The function of the Waste Collecting Centres of the Laender is explained. (HP)

23195 (KFK–5351, pp. 1.1-1.13) **Management of radioactive remnants at HDB facility of KfK - a survey.** Pfeifer, W. (Kernforschungszentrum Karlsruhe GmbH (Germany). Hauptabteilung Dekontaminationsbetriebe). Kernforschungszentrum Karlsruhe GmbH (Germany). Hauptabteilung Dekontaminationsbetriebe. May 1994. 183p. (In German). (CONF-9308272–: Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB) at Kernforschungszentrum Karlsruhe GmbH (KfK), Karlsruhe (Germany), 26 Aug 1993). In *Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB).* Order Number DE95796284. Source: OSTI; NTIS (US Sales Only); INIS.

The paper mentions the nuclear facilities delivering their radwaste to the decontamination facility, HDB, of KfK. A major task of HDB is the treatment of radioactive remnants and wastes from nuclear installations outside the Karlsruhe Nuclear Research Center. HDB is equipped with the complete set of systems required for the treatment and conditioning of radwaste, the main activity being the treatment of radioactive remnants for their restricted or unrestricted reuse beyond the applicability of the Atomic Energy Act. Treatment of other radwaste primarily aims at waste volume reduction. The paper outlines the scope of activities of HDB as determined by a medium-termed planning frame, providing for an extension of capacities and equipment for the treatment of non-burnable, solid wastes in order to cope with the radioactive scrap expected in the years to come as a result of shutdown and decommissioning of nuclear installations based at KfK. (orig./HP)

23196 (KFK–5351, pp. 10.1-10.14) **Thirty years of experience with the decontamination of equipment.** Hempelmann, W. (Kernforschungszentrum Karlsruhe GmbH (Germany). Hauptabteilung Dekontaminationsbetriebe). Kernforschungszentrum Karlsruhe GmbH (Germany). Hauptabteilung Dekontaminationsbetriebe. May 1994. 183p. (In German). (CONF-9308272–: Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB) at Kernforschungszentrum Karlsruhe GmbH (KfK), Karlsruhe (Germany), 26 Aug 1993). In *Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB).* Order Number DE95796284. Source: OSTI; NTIS (US Sales Only); INIS.

The paper summarizes the history of equipment decontamination from the 1960s to date, explaining the tasks and purposes of decontamination techniques, personnel placement, and results achieved. The defined decontamination task in the beginning was to clean contaminated equipment primarily sent from KfK installations for the purpose of unrestricted reuse, by means of wet chemical methods. This task eventually was widened to cover decontamination of radioactive remnants for unrestricted recycling. The techniques applied today include dry peening with steel gravel for decontamination of C-steel, lead, or concrete objects, and pickling for decontamination of austenitic steels and non-ferrous metals. Remnants not suitable for decontamination are processed in a facility available since 1984 to form compacted waste forms suitable for ultimate disposal. There are new tasks ahead for the Decontamination Dept. emanating from future reactor decommissioning and shutdown of other nuclear installations, as e.g. the WAK. (orig.)

23197 (KFK–5351, pp. 11.1-11.12) **Melting of radioactive metals from nuclear installations. History and stages of development.** Sappok, M. (Siempelkamp Giesserei GmbH und Co., Krefeld (Germany)). Kernforschungszentrum Karlsruhe GmbH (Germany). Hauptabteilung Dekontaminationsbetriebe. May 1994. 183p. (In German). (CONF-9308272–: Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB) at Kernforschungszentrum Karlsruhe GmbH (KfK), Karlsruhe (Germany), 26 Aug 1993). In *Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB).* Order Number DE95796284. Source: OSTI; NTIS (US Sales Only); INIS.

When it became clear in 1989 that the amounts of radioactive material to be treated in future will reach a volume suggesting melting as an alternative method, the decision was taken to build a single-purpose plant exclusively for melting radioactive metal wastes. The CARLA facility was erected and commissioned within only six months, and to date has been processing more than 5 000 tons of material, so that specific experience and operating data have been accumulated relating to a throughput of about 7 000 tons. (orig.)

23198 (KFK–5351, pp. 12.1-12.20) **Emissions induced by the process of radioactive remnants conditioning.** Becker, R. (Kernforschungszentrum Karlsruhe GmbH (Germany). Hauptabteilung Dekontaminationsbetriebe). Kernforschungszentrum Karlsruhe GmbH (Germany). Hauptabteilung Dekontaminationsbetriebe. May 1994. 183p. (In German). (CONF-9308272–: Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB) at Kernforschungszentrum Karlsruhe GmbH (KfK), Karlsruhe (Germany), 26 Aug 1993). In *Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB).* Order Number DE95796284. Source: OSTI; NTIS (US Sales Only); INIS.

The techniques applied in the Decontamination Dept., HDB, for conditioning radioactive primary and secondary waste induce emission of radiological and chemical pollutants. The paper explains the current common practice of emission monitoring and presents data of the plant-specific release of pollutants via the gaseous and liquid effluents pathway. Practice has shown that there have been no problems at all in keeping the emissions from operation below the regulatory maximum acceptable limits. The amounts released are so small that the effects on the environment remain at minimum level. Thus pollutant emission is not a factor restricting the processing of radioactive remnants or primary waste, even if high-level radioactive inventories are involved, if conditioning systems are designed and constructed in line with the appropriate operating data accumulated so far, and if emssion control is made a prime goal in the planning, control and monitoring of procedures and processes. (orig.)

23199 (KFK–5351, pp. 2.1-2.11) **Waste management tasks of the Radwaste Collecting Centers of the Laender.** Dreisvogt, H. Kernforschungszentrum Karlsruhe GmbH (Germany). Hauptabteilung Dekontaminationsbetriebe. May 1994. 183p. (In German). (CONF-9308272–: Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB) at Kernforschungszentrum Karlsruhe GmbH (KfK), Karlsruhe (Germany), 26 Aug 1993). In *Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB).* Order Number DE95796284. Source: OSTI; NTIS (US Sales Only); INIS.

The paper outlines the manifold activities of the Radwaste Collecting Centers of the Laender. According to section 9 a, sub-sec. 3 of the Atomic Energy Act, the various Laender in Germany are obliged to establish such centers whose purpose among other things is to serve as interim storage site for radwaste accrued at medical, industrial, or research facilities. (HP)

23200 (KFK–5351, pp. 3.1-3.17) **Looking back on 30 years of experience in the decontamination of radioactive, liquid effluents at KfK. The vapour compression evaporator, for example.** Pfeiffer, R. (Kernforschungszentrum Karlsruhe GmbH (Germany). Hauptabteilung Dekontaminationsbetriebe). Kernforschungszentrum Karlsruhe GmbH (Germany). Hauptabteilung Dekontaminationsbetriebe. May 1994. 183p. (In German). (CONF-9308272–: Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB) at Kernforschungszentrum Karlsruhe GmbH (KfK), Karlsruhe (Germany), 26 Aug 1993). In *Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB).* Order Number DE95796284. Source: OSTI; NTIS (US Sales Only); INIS.

The first equipment installed at KfK-HDB was a system with a thin-film evaporator. This was later replaced by two vapor compression evaporating units with forced circulation, for evaporation of liquid LAW, and a steam-heated natural circulation evaporator, for evaporation of liquid MAW. Nuclear activities of the Karlsruhe Nuclear Research Center phasing out, the liquid radwaste quantities to be treated have been shrinking accordingly, so that the current system is planned to be replaced by a smaller system with a thin-film evaporator. (orig./HP)

23201 (KFK–5351, pp. 4.1-4.24) **Treatment of radioactive remnants. Solidification of evaporation concentrates by vacuum distillation.** Engelage (Gesellschaft fuer Nuklearservice, Essen (Germany)). Kernforschungszentrum Karlsruhe GmbH (Germany). Hauptabteilung Dekontaminationsbetriebe. May 1994. 183p. (In German). (CONF-9308272–: Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB) at Kernforschungszentrum Karlsruhe GmbH (KfK), Karlsruhe (Germany), 26 Aug 1993). In *Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB).* Order Number DE95796284. Source: OSTI; NTIS (US Sales Only); INIS.

The paper deals with the treatment of liquid, inorganic remnants, i.e. evaporator concentrates, focussing on the technique of achieving solidification by dehydration. After a brief general survey of systems installed and techniques applied in Germany, two systems, named Robe and FAVORIT, are explained in more detail. Their performance and design data are discussed, and the history of the FAVORIT system is presented, showing the development of this system and its upgrading in response to changing conditions in the waste management field. (orig.)

23202 (KFK–5351, pp. 5.1-5.15) **Solidification of evaporator concentrates by means of cementation.** Vogt, L. (Kernforschungszentrum Karlsruhe GmbH (Germany). Hauptabteilung Dekontaminationsbetriebe). Kernforschungszentrum Karlsruhe GmbH (Germany). Hauptabteilung Dekontaminationsbetriebe. May 1994. 183p. (In German). (CONF-9308272–: Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB) at Kernforschungszentrum Karlsruhe GmbH (KfK), Karlsruhe (Germany), 26 Aug 1993). In *Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB).* Order Number DE95796284. Source: OSTI; NTIS (US Sales Only); INIS.

The paper recapitulates the history of development of techniques applied in the HDB department of KfK for the solidification of evaporator concentrates by way of cementation. The currently installed system is explained in design and operation. The accumulation, analysis and conditioning of concentrates according to the Conditioning Handbook is set out, as well as the determination of cementation-specific data for operational and product optimization. Novel techniques for concentrate solidification are also addressed, which are primarily aiming at waste volume minimization. (orig.)

23203 (KFK–5351, pp. 6.1-6.12) **The current technical level and planned development of waste burning plants installed at HDB.** Dirks, F. (Kernforschungszentrum Karlsruhe GmbH (Germany). Hauptabteilung Dekontaminationsbetriebe). Kernforschungszentrum Karlsruhe GmbH (Germany). Hauptabteilung Dekontaminationsbetriebe. May 1994. 183p. (In German). (CONF-9308272–: Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB) at Kernforschungszentrum Karlsruhe GmbH (KfK), Karlsruhe (Germany), 26 Aug 1993). In *Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB).* Order Number DE95796284. Source: OSTI; NTIS (US Sales Only); INIS.

The HDB department has been operating plants for burning radioactive remnants since 1972. The department is responsible for management of the radioactive waste accrued at KfK institutes, Baden-Wuerttemberg's Radwaste Collection Center, and, if plant capacity allows, delivered from other Laender on a contractual basis. The paper explains the origin and composition of the remnants to be treated, the treatment techniques available at HDB, and the capacities of the plants installed. Their current technical level is described as well as the upgrading to be achieved by December 1996 in order to meet the requirements set by the Clean Air Technical Code (TA Luft) and the 17th Ordinance For Emission Control (BImSchV). (orig.)

23204 (KFK–5351, pp. 7.1-7.15) **Dehydration in the hot-gas filtering unit as a means of reducing the volume of secondary waste from the waste burning process.** Chrubasik, A. (Nukem, Alzenau (Germany)); Bruenner, G. Kernforschungszentrum Karlsruhe GmbH (Germany). Hauptabteilung Dekontaminationsbetriebe. May 1994. 183p. (In German). (CONF-9308272–: Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB) at Kernforschungszentrum Karlsruhe GmbH (KfK), Karlsruhe (Germany), 26 Aug 1993). In *Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB).* Order Number DE95796284. Source: OSTI; NTIS (US Sales Only); INIS.

The flue gas generated in the incineration of radioactive wastes is treated by flue gas scrubbing for pollutant removal. The heat available in the incineration plant is used for dehydration of the washing fluid, and the resulting salt is compacted and processed into waste forms suitable for ultimate disposal. The final waste volume thus is only one sixth of the volume that would be produced by cementation. The hot-gas filtering unit of the incineration plant has been chosen as best suitable process unit for dehydration, as it offers the heat required for evaporation and at the same time allows deposition of the salt aerosols at the filter tubes. (orig./HP)

23205 (KFK–5351, pp. 8.1-8.11) **Ten years of experience with the operation of the LAW scrap processing plant.** Suchowitz, M. (Kraftanlagen AG Heidelberg (Germany)). Kernforschungszentrum Karlsruhe GmbH (Germany). Hauptabteilung Dekontaminationsbetriebe. May 1994. 183p. (In German). (CONF-9308272–: Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB) at Kernforschungszentrum Karlsruhe GmbH (KfK), Karlsruhe (Germany), 26 Aug 1993). In *Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB).* Order Number DE95796284. Source: OSTI; NTIS (US Sales Only); INIS.

The paper describes the LAW scrap processing plant in technical design and performance and presents operating data such as personnel requirements, plant availability, average reduction factor, and resulting collective doses. The plant's throughput is broken down into volumina, number of compacted waste forms, number of 200 litre waste drums. (orig./HP)

23206 (KFK–5351, pp. 9.1-9.16) **The new MAW scrap processing facility.** Kueppers, L. (Kernforschungszentrum Karlsruhe GmbH (Germany). Hauptabteilung Dekontaminationsbetriebe). Kernforschungszentrum Karlsruhe GmbH (Germany). Hauptabteilung Dekontaminationsbetriebe. May 1994. 183p. (In German). (CONF-9308272–: Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB) at Kernforschungszentrum Karlsruhe GmbH (KfK), Karlsruhe (Germany), 26 Aug 1993). In *Symposium: Treatment of radioactive residues at Hauptabteilung Dekontaminationsbetriebe (HDB).* Order Number DE95796284. Source: OSTI; NTIS (US Sales Only); INIS.

The shielded bunker for heat-generating waste attached to the MAW scrap processing cell will be modified and extended to comprise several MAW scrap processing cells of enhanced throughput capacity, and a new building to serve as an airlock and port for acceptance of large shipping casks (shipping cask airlock, TBS). The new facility is to process scrap from decommissioned nuclear installations, and in addition radwaste accrued at operating plants of utilities. This will allow efficient and steady use of the new MAW

scrap processing facility. The planning activities for modification and extension are based on close coordination between KfK and the GNS mbH, in order to put structural dimensioning and capacity planning on a realistic basis in line with expected amounts of radwaste from operating nuclear installations of utilities. The paper indicates the currently available waste amount assessments covering solid radwaste (MAW) from the decommissioning of the WAK, MZFR, and KNK II, and existing waste amounts consisting of core internals of German nuclear power plant. The figures show that the MAW scrap processing facility will have to process an overall bulk of about 1100 Mg of solid waste over the next ten years to come. (orig./HP)

23207 (LA–12824-MS) **Selection of a preferred initial access for the exploratory studies facility.** Boak, D.M. (Woodward Clyde Federal Services, Las Vegas, NV (United States)); Cikanek, E.M.; Elkins, N.Z. Los Alamos National Lab., NM (United States). Jun 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95015063. Source: OSTI; NTIS; INIS; GPO Dep.

An issue of interest to the Yucca Mountain Site Characterization Project Office (YMPO) has been selection of the preferred location for initial access to the Exploratory Studies Facility (ESF) in the event that the U.S. Department of Energy (DOE) elected to proceed with a phased approach to facility development. A task force to conduct an assessment and prepare a recommendation of the preferred initial location (north or south) for starting underground in situ tests at Yucca Mountain was initiated by YMPO to address this issue. The task force addressed geotechnical issues associated with the presence of disqualifying conditions at the site, the inability of the site to meet qualifying conditions, and the potential for unexpected geologic conditions at the site. The task force compared the north and south ramp accesses of the ESF to determine whether either access would be more likely to provide relevant information about potential site unsuitability. The task force did not address issues such as design time or construction costs. Within the aforementioned context, a balanced evaluation of currently available geotechnical information and issues failed to provide a clear mandate for either ramp as the preferred initial ESF access. Neither access was clearly superior in providing geotechnical information to resolve site suitability issues. The task force therefore recommended that other appropriate programmatic factors, such as schedule, be used as a basis in determining the choice of a preferred, initial ESF access in the event of phased construction.

23208 (LA–12954-MS) **Radionuclide concentrations in vegetation at radioactive-waste disposal Area G during the 1994 growing season.** Fresquez, P.R.; Biggs, J.B.; Bennett, K.D. Los Alamos National Lab., NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95015051. Source: OSTI; NTIS; INIS; GPO Dep.

Overstory (pinon pine) and understory (grass and forb) vegetation samples were collected within and around selected points at Area G-a low-level radioactive solid-waste disposal facility at Los Alamos National Laboratory-for the analysis of tritium (^{3}H), strontium (^{90}Sr), plutonium (^{238}Pu and ^{239}Pu), cesium (^{137}Cs), americium (^{241}Am), and total uranium. In general, most vegetation samples collected within and around Area G contained radionuclide levels in higher concentrations than vegetation collected from background areas. Tritium, in particular, was detected as high as 5,800 pCi/mL in overstory vegetation collected outside the fence just west of the tritium shafts; this suggests that tritium is migrating from this waste repository through subsurface pathways. Also, understory vegetation collected north of the transuranic (TRU) pads (outside the fence of Area G) contained the highest values of ^{90}Sr, ^{238}Pu, ^{239}Pu, ^{137}Cs, and ^{241}Am, and may be a result of surface holding, storage, or disposal activities.

23209 (LA-SUB–95-36-Vol.2) **FY94 CAG trip reports, CAG memos and other products: Volume 2. Final report.** Los Alamos National Lab., NM (United States); Computer Applications Group, Inc., Carlton, OR (United States). 15 Dec 1994. 290p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95013477. Source: OSTI; NTIS; INIS; GPO Dep.

The Yucca Mountain Site Characterization Project (YMP) of the US DOE is tasked with designing, constructing, and operating an Exploratory Studies Facility (ESF) at Yucca Mountain, Nevada. The purpose of the YMP is to provide detailed characterization of the Yucca Mountain site for the potential mined geologic repository for permanent disposal of high-level radioactive waste. Detailed characterization of properties of the site are to be conducted through a wide variety of short-term and long-term in-situ tests. Testing methods require the installation of a large number of test instruments and sensors with a variety of functions. These instruments produce analog and digital data that must be collected, processed, stored, and evaluated in an attempt to predict performance of the repository. The Integrated Data and Control System (IDCS) is envisioned as a distributed data acquisition that electronically acquires and stores data from these test instruments. IDCS designers are responsible for designing and overseeing the procurement of the system, IDCS Operation and Maintenance operates and maintains the installed system, and the IDCS Data Manager is responsible for distribution of IDCS data to participants. This report is a compilation of trip reports, interoffice memos, and other memos relevant to Computer Applications Group, Inc., work on this project.

23210 (LA-SUB–95-73) **Determination of water movement in the unsaturated zone at Yucca Mountain using chloride, bromide, and chlorine isotopes as environmental tracers. Final report.** Los Alamos National Lab., NM (United States); Hydro Geo Chem., Inc., Tucson, AZ (United States). 31 Jul 1994. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95014568. Source: OSTI; NTIS; INIS; GPO Dep.

This report, prepared by Hydro Geo Chem staff for Los Alamos National Laboratory, summarizes work conducted by the company under Subcontract 9-XG1-N3993-1. The ultimate objective of this work is to characterize the movement of subsurface water in the vicinity of Yucca Mountain, Nevada. Data produced under this contract is to be used by the US Department of Energy in its Yucca Mountain Site Characterization Project (YMP) to help determine hydrologic flows that may affect the performance of a potential nuclear waste repository. The data may be used in the licensing proceedings, and certain quality assurance procedures have thus been required. The work has focussed on measuring the distribution of environmental tracers-chlorine-36, chlorine, and bromine-and on evaluating the depth to which these conservative solutes have percolated in the unsaturated zone at Yucca Mountain. The following discussion summarizes progress made on the tasks outlined in the original Scope of Work. Details of this work and all data acquired by Hydro Geo Chem for this subcontract have been systematically organized in logbooks and laboratory notebooks. These documents have been structured to make it easy to trace the analytical history of a sample, from time of receipt to the final analytical results.

23211 (LA-UR–95-1838) **Mixed waste focus area alternative technologies workshop.** Borduin, L.C. (Los Alamos National Lab., NM (United States). Technology Analysis Group); Palmer, B.A.; Pendergrass, J.A. Los Alamos National Lab., NM (United States). 24 May 1995. 158p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9501100–Summ: Mixed waste focus area alternative technologies workshop, Salt Lake City, UT (United States), 24-27 Jan 1995). Order Number DE95015256. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the Mixed Waste Focus Area (MWFA)-sponsored Alternative Technology Workshop held in Salt Lake City, Utah, from January 24–27, 1995. The primary workshop goal was identifying potential applications for emerging technologies within the Options Analysis Team (OAT) "wise" configuration. Consistent with the scope of the OAT analysis, the review was limited to the Mixed Low-Level Waste (MLLW) fraction of DOE's mixed waste inventory. The Los Alamos team prepared workshop materials (databases and compilations) to be used as bases for participant review and recommendations. These materials derived from the Mixed Waste Inventory Report (MWIR) data base (May 1994), the Draft Site Treatment Plan (DSTP) data base, and the OAT treatment facility configuration of December 7, 1994. In reviewing workshop results, the reader should note several caveats regarding data limitations. Link-up of the MWIR and DSTP data bases, while

representing the most comprehensive array of mixed waste information available at the time of the workshop, requires additional data to completely characterize all waste streams. A number of changes in waste identification (new and redefined streams) occurred during the interval from compilation of the data base to compilation of the DSTP data base with the end result that precise identification of radiological and contaminant characteristics was not possible for these streams. To a degree, these shortcomings compromise the workshop results; however, the preponderance of waste data was linked adequately, and therefore, these analyses should provide useful insight into potential applications of alternative technologies to DOE MLLW treatment facilities.

23212 (LBL–37040) **A simple procedure for estimating the effective hydraulic conductivity of a two-dimensional saturated or partly-saturated fracture network.** Zimmerman, R.W.; Bodvarsson, G.S. Lawrence Berkeley Lab., CA (United States). Apr 1995. 10p. Sponsored by USDOE, Washington, DC (United States);Geological Survey, Reston, VA (United States). DOE Contract AC03-76SF00098. (CONF-9504179–1: 6. annual international conference on high level radioactive waste management, Las Vegas, NV (United States), 30 Apr - 5 may 1995). Order Number DE95014872. Source: OSTI; NTIS; INIS; GPO Dep.

Many of the sites that have been proposed as potential locations of underground radioactive waste respositories contain fractured rocks. When modeling the hydrological behavior of these sites, for either the purpose of site characterization or performance assessment, computational gridblocks are often used that contain large numbers of individual fractures. In order to treat these gridblocks as equivalent continua, it is necessary to develop a procedure for relating the hydraulic properties of the individual fractures, and the topology of the fracture network, to the overall gridblock-scale permeability. The purpose of this paper is to describe a simple upscaling procedure, and demonstrate its use in cases of both saturated and unsaturated flow. The effective medium theory developed by Kirkpatrick has been used as the basis for a procedure for finding the effective gridblock-scale conductivity of a two-dimensional fracture network. In contrast to computationally-intensive flow simulations, the proposed procedure requires only the solution of a single nonlinear equation. The method has been tested against some previously published numerical simulations of flow through saturated and unsaturated networks, and in both cases yields reasonably accurate predictions of the macroscopic hydraulic conductivity.

23213 (LBL–37332) **Effective transmissivity of two-dimensional fracture networks.** Simmerman, R.W.; Bodvarsson, G.S. Lawrence Berkeley Lab., CA (United States). Apr 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95015139. Source: OSTI; NTIS; INIS; GPO Dep.

Many of the sites that have been proposed as potential locations of underground radioactive waste repositories contain fractured rocks. For example, both the saturated and unsaturated zone at Yucca Mountain, Nevada, contains many hydrogeologic units that are extensively fractured. When modeling the hydrological behavior of these sites, for either the purpose of site characterization of performance assessment, computational grid-blocks are often used that contain large number of fractures. In order to treat these as equivalent continua, it is necessary to develop a procedure for relating the hydraulic properties of the individual fractures and he topology of the fracture network to the overall scale permeability. One aspect of this problem is that of determining the in situ hydraulic properties of the individual fractures. Another aspect is to reconstruct the three-dimensional geometry of the fracture network based on borehole or outcrop measurements. The final stage in the problem is that of taking a network of known geometry and determining it effective scale conductivity. The purpose of this paper is to describe a simple procedure for solving this latter problem,a nd to demonstrate it use in cases of both saturated and unsaturated flow. The TOUGH simulator was used.

23214 (LBL–37337) **Weathering products of basic rocks as sorptive materials of natural radionuclides.** Omelianenko, B.I. (AN SSSR, Moscow (Russian Federation). Inst. Geologii Rudnykh Mestorozhdenij, Petrografii, Mineralogii i Geokhimii); Niconov, B.S.; Ryzhov, B.I.; Shikina, N.D. Lawrence Berkeley Lab., CA (United States). Jun 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95015137. Source: OSTI; NTIS; INIS; GPO Dep.

The principal requirements for employing natural minerals as buffer and backfill material in high-level waste (HLW) repositories are high sorptive properties, low water permeability, relatively high thermal conductivity, and thermostability. The major task of the buffer is to prevent the penetration of radionuclides into groundwater. The authors of this report examined weathered basic rocks from three regions of Russia in consideration as a suitable radioactive waste barrier.

23215 (NCRP–95-22246) **Radioactive and mixed waste - risk as a basis for waste classification. Symposium proceedings No. 2.** Oak Ridge National Lab., TN (United States). 21 Jun 1995. 201p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (CONF-941192–: Symposium on radioactive and mixed waste: risk as a basis for waste classification, Las Vegas, NV (United States), 9 Nov 1994). Order Number DE95016101. Source: OSTI; NTIS; INIS; NCRP Publications, 7910 Woodmont Avenue, Suite 800, Bethesda, MD 20814-3095; GPO Dep.

The management of risks from radioactive and chemical materials has been a major environmental concern in the United states for the past two or three decades. Risk management of these materials encompasses the remediation of past disposal practices as well as development of appropriate strategies and controls for current and future operations. This symposium is concerned primarily with low-level radioactive wastes and mixed wastes. Individual reports were processed separately for the Department of Energy databases.

23216 (ORNL/ER–294) **Readiness review plan for the in situ vitrification demonstration of Seepage Pit 1 in Waste Area Grouping 7.** Oak Ridge National Lab., TN (United States). May 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95014002. Source: OSTI; NTIS; INIS; GPO Dep.

A treatability study is planned that encompasses the application of in situ vitrification (ISV) to at least two segments of the Oak Ridge National Laboratory Seepage Pit I during the third quarter of fiscal year 1995. Before the treatability study can be initiated, the proposed activity must be subjected to an Operational Readiness Review (ORR). ORR is a structured methodology of determining readiness to proceed as outlined in Martin Marietta Energy Systems, Inc. (Energy Systems), Environmental Restoration Waste Management Procedure ER/C-P1610, which provides Energy Systems organizations assurance that the work to be performed is consistent with management's expectations and that the subject activity is ready to proceed safely. The readiness review plan provides details of the review plan overview and the scope of work to be performed. The plan also identifies individuals and position responsibilities for implementing the activity. The management appointed Readiness Review Board (RRB) has been identified. A Field Readiness Review Team (FRT), a management appointed multidisciplinary group, has been established (1) to evaluate the ISV treatability study, (2) to identify and assemble supporting objective evidences of the readiness to proceed, and (3) to assist the team leader in presenting the evidences to the RRB. A major component of RRB is the formulation of readiness review criteria months before the operation. A comprehensive readiness review tree (a positive logic tree) is included, which identifies the activities required for the development of the readiness criteria. The readiness review tree serves as a tool to prevent the omission of an item that could affect system performance. All deficiencies identified in the review will be determined as prestart findings and must be resolved before the project is permitted to proceed. The final approval of the readiness to proceed will be the decision of RRB.

23217 (ORNL/TM–12784) **Application of the TRUEX process to highly irradiated targets.** Felker, L.K.; Benker, D.E. Oak Ridge National Lab., TN (United States). Mar 1995. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95011630. Source: OSTI; NTIS; INIS; GPO Dep.

The Radiochemical Engineering Development Center (REDC) at Oak Ridge National Laboratory processes highly irradiated targets for the Mark 42 program to separate americium, curium, and plutonium. Argonne National Laboratory (ANL) has developed the TRUEX process for the removal of transuranic elements from aqueous waste streams and a computer model that aids in the design of potential flowsheets. Because the TRUEX process is attractive for application to the large volumes of high-activity tank wastes stored at various Department of Energy sites, a test of the process on the highly irradiated Mark 42 target material would yield useful information on the performance of the process under "real" conditions. Researchers at ANL used the Generic TRUEX Model (GTM) to design a TRUEX flowsheet to process Mark 42 target material. Researchers at the REDC refurbished the Solvent Extraction Test Facility mixer-settler contactors and conducted three test runs using the TRUEX process. The results from the three demonstration tests are presented along with the predicted results from the GTM.

23218 (ORNL/TM–12913) **Liquid and Gaseous Waste Operations Department annual operating report CY 1994.** Maddox, J.J.; Scott, C.B. Oak Ridge National Lab., TN (United States). Mar 1995. 112p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95014460. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents details about the operation of the liquid and gaseous waste department of Oak Ridge National Laboratory for the calendar year 1994. Topics discussed include; process waste system, upgrade activities, low-level liquid radioactive waste solidification project, maintenance activities, and other activities such as training, audits, and tours.

23219 (ORNL/TM–12919) **Environmental assessment and social justice.** Vogt, B.M. (Oak Ridge National Lab., TN (United States)); Sorensen, J.H.; Hardee, H. Oak Ridge National Lab., TN (United States). Mar 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95012501. Source: OSTI; NTIS; GPO Dep.

The purpose of this document is to describe an approach to assessing environmental justice issues at the start of proposed project. It is a structural approach to screening using readily available census data and commercial products that emphasizes the ability to replicate results and provide systematic data that can be used to identify spatial inequities. While our discussion of the methodology addresses only public health and safety issues related to certain minority and cohort sub-groups, systematic use of methodology could provide a valuable screening tool for identifying impacts particular to low-income groups. While the assumptions can be questioned as to applicability, they are based both on theory and practical knowledge.

23220 (ORNL/TM–12935) **Tank Focus Area Pretreatment Program. FY 1995 Program Management Plan.** Morrison, M.I. (Midwest Technical Inc., Oak Ridge, Tennessee (United States)); McGinnis, C.P.; Wilkenson, W.T.; Hunt, R.D. Oak Ridge National Lab., TN (United States). Feb 1995. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95012546. Source: OSTI; NTIS; INIS; GPO Dep.

This program management plan (PMP) describes the FY 1995 project plans for the Pretreatment Program of the Tank Focus Area. The Tank Focus Area is one of five areas of environmental concerns originally identified by the Deputy Assistant Secretary for Technology Development (EM-50). Projects in the Tank Focus Area relate to the remediation of liquid waste stored in underground storage tanks at various US Department of Energy sites. The Pretreatment Program is an organizational unit performing work within the Tank Focus Area. The function of the Pretreatment Program is to develop, test, evaluate, and demonstrate new technologies, with emphasis on separations. The 11 Pretreatment Program projects for FY 1995 are (1) Cesium Extraction Testing, (2) Comprehensive Supernate Treatment, (3) Hot Cell Studies, (4) Cesium Removal Demonstration, (5) Out-of-Tank Evaporator Demonstration, (6) Crossflow Filtration, (7) Technical Interchange with CEA, (8) TRUEX Applications, (9) NAC/NAG Process Studies (conducted at Oak Ridge National Laboratory), (10) NAC/NAG Process and Waste Form Studies (conducted at Florida International University), and (11) Program Management. Section 2 of this PMP contains a separate subsection for each FY 1995 project. A brief description of the project, a schedule of major milestones, and a breakdown of costs are provided for each project. The PMP also contains sections that describe the project controls that are in place. Quality assurance, document control, the project management system, and the management organization are described in these sections.

23221 (ORNL/TM–12938) **Evaluation of selected ion exchangers for the removal of cesium from MVST W-25 supernate.** Collins, J.L.; Egan, B.Z.; Anderson, K.K.; Chase, C.W.; Mrochek, J.E.; Bell, J.T.; Jernigan, G.E. Oak Ridge National Lab., TN (United States). Apr 1995. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95013798. Source: OSTI; NTIS; INIS; GPO Dep.

The goal of this batch-test equilibration study was to evaluate the effectiveness of certain ion exchangers for removing cesium from supernate taken from tank W-25 of the Melton Valley Storage Tank (MVST) Facility located at the Oak Ridge National Laboratory (ORNL). These exchangers were selective for removing cesium from alkaline supernatant solutions with high salt concentrations. Since the supernates of evaporator concentrates stored in tanks at the MVST facility have compositions similar to some of those stored in tanks at Hanford, the data generated in this study should prove useful in the overall evaluation of the ion exchangers for applications to Hanford and other US Department of Energy (USDOE) sites. A goal of the waste processing effort at Hanford is to remove enough cesium to ensure that the resulting LLW will meet the Nuclear Regulatory Commission (NRC) 10 CFR 61 class A limit for ^{137}Cs (1 Ci/m^3 or 1 μCi/mL). The separated cesium may be concentrated and vitrified for disposal in the high-level waste repository. The decontaminated effluent would be solidified for near-surface disposal.

23222 (ORNL/TM–13007) **Technical support for the Ukrainian State Committee for Nuclear Radiation Safety on specific waste issues.** Little, C.A. Oak Ridge National Lab., TN (United States). [1995]. 25p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. Source: OSTI; NTIS; INIS.

The government of Ukraine, a now-independent former member of the Soviet Union, has asked the United States to assist its State Committee for Nuclear and Radiation Safety (SCNRS) in improving its regulatory control in technical fields for which it has responsibility. The US Nuclear Regulatory Commission (NRC) is providing this assistance in several areas, including management of radioactive waste and spent fuel. Radioactive wastes resulting from nuclear power plant operation, maintenance, and decommissioning must be stored and ultimately disposed of appropriately. In addition, radioactive residue from radioisotopes used in various industrial and medical applications must be managed. The objective of this program is to provide the Ukrainian SCNRS with the information it needs to establish regulatory control over uranium mining and milling activities in the Zheltye Vody (Yellow Waters) area and radioactive waste disposal in the Pripyat (Chernobyl) area among others. The author of this report, head of the Environmental Technology Section, Health Sciences Research Division of Oak Ridge National Laboratory, accompanied NRC staff to Ukraine to meet with SCNRS staff and visit sites in question. The report highlights problems at the sites visited and recommends license conditions that SCNRS can require to enhance safety of handling mining and milling wastes. The author's responsibility was specifically for the visit to Zheltye Vody and the mining and milling waste sites associated with that facility. An itinerary for the Zheltye Vody portion of the trip is included as Appendix A.

23223 (ORNL/TM–13034) **A facility design for repackaging ORNL CH-TRU legacy waste in Building 3525.** Huxford, T.J. (Oak Ridge National Lab., TN (United States)); Cooper, R.H. Jr.; Davis, L.E.; Fuller, A.B.; Gabbard, W.A.; Smith, R.B.; Guay, K.P.; Smith, L.C. Oak Ridge National Lab., TN (United States). Jul 1995. 95p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95008645. Source: OSTI; NTIS; INIS; GPO Dep.

For the last 25 years, the Oak Ridge National Laboratory (ORNL) has conducted operations which have generated solid, contact-handled transuranic (CH-TRU) waste. At present the

CH-TRU waste inventory at ORNL is about 3400 55-gal drums retrievably stored in RCRA-permitted, aboveground facilities. Of the 3400 drums, approximately 2600 drums will need to be repackaged. The current US Department of Energy (DOE) strategy for disposal of these drums is to transport them to the Waste Isolation Pilot Plant (WIPP) in New Mexico which only accepts TRU waste that meets a very specific set of criteria documented in the WIPP-WAC (waste acceptance criteria). This report describes activities that were performed from January 1994 to May 1995 associated with the design and preparation of an existing facility for repackaging and certifying some or all of the CH-TRU drums at ORNL to meet the WIPP-WAC. For this study, the Irradiated Fuel Examination Laboratory (IFEL) in Building 3525 was selected as the reference facility for modification. These design activities were terminated in May 1995 as more attractive options for CH-TRU waste repackaging were considered to be available. As a result, this document serves as a final report of those design activities.

23224 (PNL–8040) **Extrapolation of creep behavior of high-density polyethylene liner in the Catch Basin of grout vaults.** Whyatt, G.A. Pacific Northwest Lab., Richland, WA (United States). Jul 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015838. Source: OSTI; NTIS; INIS; GPO Dep.

Testing was performed to determine if gravel particles will creep into and puncture the high-density polyethylene (HDPE) liner in the catch basin of a grout vault over a nominal 30-year period. Testing was performed to support a design without a protective geotextile cover after the geotextile was removed from the design. Recently, a protective geotextile cover over the liner was put back into the design. The data indicate that the geotextile has an insignificant effect on the creep of gravel into the liner. However, the geotextile may help to protect the liner during construction. Two types of tests were performed to evaluate the potential for creep-related puncture. In the first type of test, a very sensitive instrument measured the rate at which a probe crept into HDPE over a 20-minute period at temperatures of 176°F to 212°F (80°C to 100°C). The second type of test consisted of placing the liner between gravel and mortar at 194°F (90°C) and 45.1 psi overburden pressure for periods up to 1 year. By combining data from the two tests, the long-term behavior of the creep was extrapolated to 30 years of service. After 30 years of service, the liner will be in a nearly steady condition and further creep will be extremely small. The results indicate that the creep of gravel into the liner will not create a puncture during service at 194°F (90°C). The estimated creep over 30 years is expected to be less than 25 mils out of the total initial thickness of 60 mils. The test temperature of 194°F (90°C) corresponds to the design basis temperature of the vault. Lower temperatures are expected at the liner, which makes the test conservative. Only the potential for failure of the liner resulting from creep of gravel is addressed in this report.

23225 (PNL–10360) **Analysis of organic carbon and moisture in Hanford single-shell tank waste.** Toth, J.J.; Heasler, P.G.; Lerchen, M.E.; Hill, J.G.; Whitney, P.D. Pacific Northwest Lab., Richland, WA (United States). May 1995. 162p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95014506. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents a revised analysis performed by Pacific Northwest Laboratory involving the organic carbon laboratory measurement data for Hanford single-shell tanks (SSTs) obtained from a review of the laboratory analytical data. This activity has as its objective to provide a best-estimate, including confidence levels, of total organic carbon (TOC) and moisture in each of the 149 SSTs at Hanford. The TOC and moisture information presented in this report is useful as part of the criteria to identify SSTs for additional measurements, or monitoring for the Organic Safety Program. In April 1994, an initial study of the organic carbon in Hanford single-shell tanks was completed at PNL. That study reflected the estimates of TOC based on tank characterizations datasets that were available at the time. Also in that study, estimation of dry basis TOC was based on generalized assumptions pertaining to the moisture of the tank wastes. The new information pertaining to tank moisture and TOC data that has become available from the current study influences the best estimates of TOC in each of the SSTs. This investigation of tank TOC and moisture has resulted in improved estimates based on waste phase: saltcake, sludge, or liquid. This report details the assumptions and methodologies used to develop the estimates of TOC and moisture in each of the 149 SSTs at Hanford.

23226 (PNL–10460) **Inorganic ion exchange evaluation and design: Silicotitanate ion exchange waste conversion.** Balmer, M.L.; Bunker, B.C. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95011683. Source: OSTI; NTIS; INIS; GPO Dep.

Ion exchange materials are being evaluated for removing Cs, SR from tank waste. Thermal conversion of a variety of compositions within the Cs_2O-TiO_2-SiO_2 phase diagram yielded both glass and crystalline materials, some of which show low leach rates and negligible Cs losses during heat treatment. A new material, $CsTiSi_2O_6$, with a structure isomorphous to pollucite ($CsAlSi_2O_6$) has been identified. This material represents a new class of crystalline zeolite materials which contain large amounts of titanium. Direct conversion of Cs loaded silicotitanate ion exchangers to $CsTiSi_2O_6$ is an excellent alternative to dissolving the Cs-loaded or Cs-eluted exchangers in borosilicate glass because: $CsTiSi_2O_6$ is formed using a simple, one step heat treatment. The unique crystalline pollucite-like structure of $CsTiSi_2O_6$ traps Cs, and exhibits extremely low Cs leach rates. $CsTiSi_2O_6$ is converted to solid waste at a low processing temperature of 700 to 800 C (nominal melter operating temperatures are 1150 C). $CsTiSi_2O_6$ concentrates the waste, thus generating lower volumes of expensive HLW. Cs losses due to volatilization during processing of $CsTiSi_2O_6$ are extremely low.

23227 (PNL–10522) **Hanford stakeholder participation in evaluating innovative technologies: VOC product line, Passive soil vapor extraction using borehole flux tunable hybrid plasma.** Peterson, T.; McCabe, G.; Niesen, K.; Serie, P. Pacific Northwest Lab., Richland, WA (United States). May 1995. 67p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95011869. Source: OSTI; NTIS; INIS; GPO Dep.

A three-phased stakeholder participation program was conducted to support the Volatile Organic Compounds Arid Site Integrated Demonstration (VOC-Arid ID). The US DOE's Office of Technology Development (OTD) sponsored and directed the VOC-Arid ID. Its purpose was to develop and demonstrate new technologies for remediating VOC contamination in soil and ground water. The integrated demonstration, hosted by the Hanford site in Washington State, is being transitioned into the Department of Energy's (DOE) Plume Focus Area. The Plume Focus Area has the same basic objectives as the ID, but is broader in scope and is a team effort with technology developers and technology users. The objective is to demonstrate a promising technology once, and if results warrant deploy it broadly across the DOE complex and in private sector applications.

23228 (PNL–10589) **Tank Waste Remediation System Guide.** Robershotte, M.A.; Dirks, L.L.; Seaver, D.A.; Bothers, A.J.; Madden, M.S. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015134. Source: OSTI; NTIS; INIS; GPO Dep.

The scope, number and complexity of Tank Waste Remediation System (TWRS) decisions require an integrated, consistent, and logical approach to decision making. TWRS has adopted a seven-step decision process applicable to all decisions. Not all decisions, however, require the same degree of rigor/detail. The decision impact will dictate the appropriate required detail. In the entire process, values, both from the public as well as from the decision makers, play a key role. This document concludes with a general discussion of the implementation process that includes the roles of concerned parties.

23229 (PNL–10600) **Storage of LWR spent fuel in air. Volume 3, Results from exposure of spent fuel to fluorine-contaminated air.** Cunningham, M.E.; Thomas, L.E. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 371p.

Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015594. Source: OSTI; NTIS; INIS; GPO Dep.

The Behavior of Spent Fuel in Storage (BSFS) Project has conducted research to develop data on spent nuclear fuel (irradiated UO_2) that could be used to support design, licensing, and operation of dry storage installations. Test Series B conducted by the BSFS Project was designed as a long-term study of the oxidation of spent fuel exposed to air. It was discovered after the exposures were completed in September 1990 that the test specimens had been exposed to an atmosphere of bottled air contaminated with an unknown quantity of fluorine. This exposure resulted in the test specimens reacting with both the oxygen and the fluorine in the oven atmospheres. The apparent source of the fluorine was gamma radiation-induced chemical decomposition of the fluoroelastomer gaskets used to seal the oven doors. This chemical decomposition apparently released hydrofluoric acid (HF) vapor into the oven atmospheres. Because the Test Series B specimens were exposed to a fluorine-contaminated oven atmosphere and reacted with the fluorine, it is recommended that the Test Series B data not be used to develop time-temperature limits for exposure of spent nuclear fuel to air. This report has been prepared to document Test Series B and present the collected data and observations.

23230 (PNL-SA–24720) **Hanford high level waste: Sample Exchange/Evaluation (SEE) Program.** King, A.G. Pacific Northwest Lab., Richland, WA (United States). Aug 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-940815–113: International nuclear and hazardous waste management conference, Atlanta, GA (United States), 14-18 Aug 1994). Order Number DE95014639. Source: OSTI; NTIS; INIS; GPO Dep.

The Pacific Northwest Laboratory (PNL)/Analytical Chemistry Laboratory (ACL) and the Westinghouse Hanford Company (WHC)/ Process Analytical Laboratory (PAL) provide analytical support services to various environmental restoration and waste management projects/programs at Hanford. In response to a US Department of Energy – Richland Field Office (DOE-RL) audit, which questioned the comparability of analytical methods employed at each laboratory, the Sample Exchange/Exchange (SEE) program was initiated. The SEE Program is a selfassessment program designed to compare analytical methods of the PAL and ACL laboratories using sitespecific waste material. The SEE program is managed by a collaborative, the Quality Assurance Triad (Triad). Triad membership is made up of representatives from the WHC/PAL, PNL/ACL, and WHC Hanford Analytical Services Management (HASM) organizations. The Triad works together to design/evaluate/implement each phase of the SEE Program.

23231 (PNL-SA–24982) **Optimization of waste loading in high-level glass in the presence of uncertainty.** Hoza, M. (and others); Fann, G.I.; Hopkins, D.F. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950216–150: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95014167. Source: OSTI; NTIS; INIS; GPO Dep.

Hanford high-level liquid waste will be converted into a glass form for long-term storage. The glass must meet certain constraints on its composition and properties in order to have desired properties for processing (e.g., electrical conductivity, viscosity, and liquidus temperature) and acceptable durability for long-term storage. The Optimal Waste Loading (OWL) models, based on rigorous mathematical optimization techniques, have been developed to minimize the number of glass logs required and determine glass-former compositions that will produce a glass meeting all relevant constraints. There is considerable uncertainty in many of the models and data relevant to the formulation of high-level glass. In this paper, we discuss how we handle uncertainty in the glass property models and in the high-level waste composition to the vitrification process. Glass property constraints used in optimization are inequalities that relate glass property models obtained by regression analysis of experimental data to numerical limits on property values. Therefore, these constraints are subject to uncertainty. The sampling distributions of the regression models are used to describe the uncertainties associated with the constraints. The optimization then accounts for these uncertainties by requiring the constraints to be satisfied within specified confidence limits. The uncertainty in waste composition is handled using stochastic optimization. Given means and standard deviations of component masses in the high-level waste stream, distributions of possible values for each component are generated. A series of optimization runs is performed; the distribution of each waste component is sampled for each run. The resultant distribution of solutions is then statistically summarized. The ability of OWL models to handle these forms of uncertainty make them very useful tools in designing and evaluating high-level waste glasses formulations.

23232 (PNL-SA–25753) **A PC-based software package for modeling DOE mixed-waste management options.** Abashian, M.S. (IT Corp., Albuquerque, NM (United States)); Carney, C.; Schum, K. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950216–153: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95014171. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) Headquarters and associated contractors have developed an IBM PC-based software package that estimates costs, schedules, and public and occupational health risks for a range of mixed-waste management options. A key application of the software package is the comparison of various waste-treatment options documented in the draft Site Treatment Plans prepared in accordance with the requirements of the Federal Facility Compliance Act of 1992. This automated Systems Analysis Methodology consists of a user interface for configuring complexwide or site-specific waste-management options; calculational algorithms for cost, schedule and risk; and user-selected graphical or tabular output of results. The mixed-waste management activities modeled in the automated Systems Analysis Methodology include waste storage, characterization, handling, transportation, treatment, and disposal. Analyses of treatment options identified in the draft Site Treatment Plans suggest potential cost and schedule savings from consolidation of proposed treatment facilities. This paper presents an overview of the automated Systems Analysis Methodology.

23233 (PNL-SA–25764) **Vitrification development for mixed wastes.** Merrill, R.; Whittington, K.; Peters, R. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950216–154: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95014190. Source: OSTI; NTIS; INIS; GPO Dep.

Vitrification is a promising approach to waste-form immobilization. It destroys hazardous organic compounds and produces a durable and highly stable glass. Vitrification tests were performed on three surrogate wastes during fiscal year 1994; 183-H Solar Evaporation Basin waste from Hanford, bottom ash from the Oak Ridge TSCA incinerator, and saltcrete from Rocky Flats. Preliminary glass development involved melting trials followed by visual homogeneity examination, short-duration leach tests on glass specimens, and long-term leach tests on selected glasses. Viscosity and electrical conductivity measurements were taken for the most durable glass formulations. Results for the saltcrete are presented in this paper and demonstrate the applicability of vitrification technology to this mixed waste.

23234 (PNL-SA–26071) **Waste forms based on Cs-loaded silicotitanates.** Balmer, M.L.; Bunker, B.C. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950401–18: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 may 1995). Order Number DE95014169. Source: OSTI; NTIS; INIS; GPO Dep.

Silicotitanate ion exchange materials are being considered for removal of radioactive Cs and Sr from tank wastes at the Hanford site. The phase evolution as a function of heat treatment temperature for several sol gel derived compositions within the Cs_2O-SiO_2-TiO_2 system was investigated, in order to determine if

an adequate waste form can be achieved by direct thermal conversion. The Cs leach rates and Cs loss during heat treatment of select materials were measured. Some compositions which contain large amounts of Ti melt to form a glass with reasonably low aqueous leach rates. A new Cs-silicotitanate material with a structure isomorphous to pollucite was discovered. This material forms at low temperatures (700–800 C) where Cs volatility is negligible. The silicotitanate-pollucite exhibits extremely low leach rates (1.42 g/m^2day) at 90 C, and has been identified as a promising waste form for Cs containment.

23235 (PNL-SA–26111) **Enterprise wide transparent information access.** Brown, J. Pacific Northwest Lab., Richland, WA (United States). May 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9505236–1: Sybase Users Group conference, Dallas, TX (United States), 15-18 May 1995). Order Number DE95014198. Source: OSTI; NTIS; INIS; GPO Dep.

The information management needs of the Department of Energy (DOE) represents a fertile domain for the development of highly sophisticated yet intuitive enterprise-wide computing solutions. These solutions must support business operations, research agendas, technology development efforts, decision support, and other application areas with a user base ranging from technical staff to the highest levels of management. One area of primary interest is in the Environmental Restoration and Waste Management Branch of DOE. In this arena, the issue of tracking and managing nuclear waste related to the long legacy of prior defense production and research programs is one of high visibility and great concern. The Tank Waste Information Network System (TWINS) application has been created by the Pacific Northwest Laboratory (PNL) for the DOE to assist in managing and accessing the information related to this mission. The TWINS solution addresses many of the technical issues faced by other efforts to provide integrated information access to a wide variety of stakeholders. TWINS provides secure transparent access to distributed heterogeneous multimedia information sources from around the DOE complex. The users interact with the information through a consistent user interface that presents the desired data in a common format regardless of the structure of the source information. The solutions developed by the TWINS project represent an integration of several technologies and products that can be applied to other mission areas within DOE and other government agencies. These solutions are now being applied to public and private sector problem domains as well. The successful integration and inter-operation of both commercial and custom modules into a flexible and extensible information architecture will help ensure that new problems facing DOE and other clients can be addressed more rapidly in the future by re-use of existing tools and techniques proven viable through the TWINS efforts.

23236 (PNL-SA–26147) **Application of macro material flow modeling to the decision making process for integrated waste management systems.** Vigil, S.A. (California Polytechnic State Univ., San Luis Obispo, CA (United States)); Holter, G.M. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9504119–1: AWMA international speciality conference on thermal treatment and waste-to-energy technologies for solid waste management, Washington, DC (United States), 18-21 Apr 1995). Order Number DE95014635. Source: OSTI; NTIS; INIS; GPO Dep.

Computer models have been used for almost a decade to model and analyze various aspects of solid waste management Commercially available models exist for estimating the capital and operating costs of landfills, waste-to-energy facilities and compost systems and for optimizing system performance along a single dimension (e.g. cost or transportation distance). An alternative to the use of currently available models is the more flexible macro material flow modeling approach in which a macro scale or regional level approach is taken. Waste materials are tracked through the complete integrated waste management cycle from generation through recycling and reuse, and finally to ultimate disposal. Such an approach has been applied by the authors to two different applications. The STELLA simulation language (for Macintosh computers) was used to model the solid waste management system of Puerto Rico. The model incorporated population projections for all 78 municipalities in Puerto Rico from 1990 to 2010, solid waste generation factors, remaining life for the existing landfills, and projected startup time for new facilities. The Pacific Northwest Laboratory has used the SimScript simulation language (for Windows computers) to model the management of solid and hazardous wastes produced during cleanup and remediation activities at the Hanford Nuclear Site.

23237 (SAND–94-0379) **Formulation and numerical analysis of nonisothermal multiphase flow in porous media.** Martinez, M.J. (Sandia National Labs., Albuquerque, NM (United States). Engineering Sciences Center). Sandia National Labs., Albuquerque, NM (United States). Jun 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95013836. Source: OSTI; NTIS; INIS; GPO Dep.

A mathematical formulation is presented for describing the transport of air, water and energy through porous media. The development follows a continuum mechanics approach. The theory assumes the existence of various average macroscopic variables which describe the state of the system. Balance equations for mass and energy are formulated in terms of these macroscopic variables. The system is supplemented with constitutive equations relating fluxes to the state variables, and with transport property specifications. Specification of various mixing rules and thermodynamic relations completes the system of equations. A numerical simulation scheme, employing the method of lines, is described for one-dimensional flow. The numerical method is demonstrated on sample problems involving nonisothermal flow of air and water. The implementation is verified by comparison with existing numerical solutions.

23238 (SAND–95-0488/1) **Geotechnical characterization of the North Ramp of the Exploratory Studies Facility: Yucca Mountain Site Characterization Project. Volume 1, Data summary.** Brechtel, C.E. (Agapito Associates, Inc., Grand Junction, CO (United States)); Lin, Ming; Martin, E.; Kessel, D.S. Sandia National Labs., Albuquerque, NM (United States). May 1995. 304p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95015011. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the results of geological and geotechnical characterization of the Miocene volcanic tuff rocks of the Timber Mountain and Paintbrush groups that the tunnel boring machine will encounter during excavation of the Exploratory Studies Facility (ESF) North Ramp. The is being constructed by the DOE as part of the Yucca Mountain Project site characterization activities. The purpose of these activities is to evaluate the feasibility of locating a potential high-level nuclear waste repository on lands adjacent to the Nevada Test Site, Nye County, Nevada. This report was prepared as part of the Soil and Rock Properties Studies in accordance with the 8.3.1.14.2 Study Plan. This report is volume 1 of the data summary.

23239 (SAND–95-0488/2) **Geotechnical characterization of the North Ramp of the Exploratory Studies Facility: Yucca Mountain Site Characterization Project. Volume 2, NRG core-hole data appendices.** Brechtel, C.E. (Agapito Associates, Inc., Grand Junction, CO (United States)); Lin, Ming; Martin, E.; Kessel, D.S. Sandia National Labs., Albuquerque, NM (United States). May 1995. 487p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95015013. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the results of the geological and geotechnical characterization of the Miocene volcanic tuff rocks of the Timber Mountain and Paintbrush groups that the tunnel boring machine will encounter during excavations of the Exploratory Studies Facility (ESF) North Ramp. The information in this report was developed to support the design of the ESF North Ramp. The ESF is being constructed by the DOE as part of the Yucca Mountain Project site characterization activities. The purpose of these activities is to evaluate the potential to locate the national high-level nuclear waste repository on land within and adjacent to the Nevada Test Site (NTS), Nye County, Nevada. This report was prepared as part of the Soil and Rock Properties Studies in accordance with the 8.3.1.14.2 Study Plan to Provide Soil and Rock

Properties. This is volume 2 which contains NRG Corehole Data for each of the NRG Holes.

23240 (SAND–95-0776) **Passive soil venting at the Chemical Waste Landfill Site at Sandia National Laboratories, Albuquerque, New Mexico.** Phelan, J.M.; Reavis, B.; Cheng, W.C. Sandia National Labs., Albuquerque, NM (United States). May 1995. 85p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95013856. Source: OSTI; NTIS; INIS; GPO Dep.

Passive Soil Vapor Extraction was tested at the Chemical Waste Landfill (CWL) site at Sandia National Laboratories, New Mexico (SNLIW). Data collected included ambient pressures, differential pressures between soil gas and ambient air, gas flow rates into and out of the soil and concentrations of volatile organic compounds (VOCS) in vented soil gas. From the differential pressure and flow rate data, estimates of permeability were arrived at and compared with estimates from other studies. Flow, differential pressure, and ambient pressure data were collected for nearly 30 days. VOC data were collected for two six-hour periods during this time. Total VOC emissions were calculated and found to be under the limit set by the Resource Conservation and Recovery Act (RCRA). Although a complete process evaluation is not possible with the data gathered, some of the necessary information for designing a passive venting process was determined and the important parameters for designing the process were indicated. More study is required to evaluate long-term VOC removal using passive venting and to establish total remediation costs when passive venting is used as a polishing process following active soil vapor extraction.

23241 (SAND–95-1236) **Hanford coring bit temperature monitor development testing results report.** Rey, D. Sandia National Labs., Albuquerque, NM (United States). May 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95014532. Source: OSTI; NTIS; INIS; GPO Dep.

Instrumentation which directly monitors the temperature of a coring bit used to retrieve core samples of high level nuclear waste stored in tanks at Hanford was developed at Sandia National Laboratories. Monitoring the temperature of the coring bit is desired to enhance the safety of the coring operations. A unique application of mature technologies was used to accomplish the measurement. This report documents the results of development testing performed at Sandia to assure the instrumentation will withstand the severe environments present in the waste tanks.

23242 (SAND–95-8615C) **P2 performance measurement tools workbook: Draft.** Sandia National Labs., Albuquerque, NM (United States). Jun 1995. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95014354. Source: OSTI; NTIS; GPO Dep.

The underlying purpose of the Department of Energy's (DOE) Waste Minimization and Pollution Prevention (WMin/P2) Program is compliance with the waste management regulations set forth by the DOE, the federal government, and individual state and local agencies 1. In addition to these regulatory mandates, the increases in waste management costs and public interest in environmental issues have created other drivers to develop and demonstrate an effective WMin/P2 Program. The Waste Minimization Division (EM-334) must have adequate methods to calculate and roll up pollution prevention (P2) progress to meet the WMin/P2 requirements; these requirements support DOE and national objectives and direct funding. This document outlines a system to evaluate DOE's P2 progress towards the waste reduction requirements. The emphasis of these pollution prevention measurements is to evaluate whether P2 activities are effective, (i.e., has the required amount of waste been reduced as a result of the P2 activities) and to evaluate the cost management of P2 projects. The performance evaluation system presented in this document encompass these aspects: (1) site requirements that apply to all DOE waste generating organizations, (2) a baseline that is not affected by short-term waste generation, and (3) key indicators that can be rolled up across DOE sites and across specific Cognizant Secretarial Officers' (CSO) sites. In a performance-based management system, requirements are the fundamental link between the planning and measurement process. The site requirements are "targets" at the process or activity level. Measuring DOE's P2 progress toward these requirements provides the necessary feedback to (1) compare performance with the requirements/standards (i.e., whether the reduction requirement of 50% by 1999 is achievable) (2) detect departures from planned levels of performance, and (3) restore performance to the planned levels or achieve new levels of performance.

23243 (UCRL-ID–116187-94-9) **The Mixed Waste Management Facility. Monthly report, September 1994.** Streit, R. Lawrence Livermore National Lab., CA (United States). Oct 1994. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95014136. Source: OSTI; NTIS; GPO Dep.

This document is a monthly report for September, 1994 of the significant developments that have taken place at the Mixed Waste Management Facility (MWMF) located at Lawrence Livermore National Laboratory (LLNL). This report presents a project financial summary, describes the quality assurance programs, project management, and presents a monthly summary of activities for the various treatment operations.

23244 (UCRL-ID–116187-95-4) **The Mixed Waste Management Facility monthly report, April 1995.** Streit, R.D. Lawrence Livermore National Lab., CA (United States). May 1995. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95014397. Source: OSTI; NTIS; INIS; GPO Dep.

During late April, we modified the budget and work plan for FY95 to reflect a $2000K funding reduction for this fiscal year. These changes incorporate both the delayed start and slow ramp-up due to DOE funding uncertainties, as well as new and real reductions in Project activities. Due to the significant budgeting impact, this report reflects the resulting budget changes (for April). Scope and schedule impact, however, will be documented in the May report due to the additional effort involved in assessing schedule impact. We will combine the May Monthly Report and the Revised FY95 Plan for cost efficiency; we will submit the FY95 Plan Rebaseline for approval by DOE in May. Technical progress continued during April, but was redirected toward the new FY95 Plan. Key changes in the revised plan are to delete MEO from Project scope and wrap up work to date, defer further major procurements for the Project from FY95, delete MSO staff additions (with milestones), and defer work and milestones in other WBS elements. Engineering development, preliminary design, and peer reviews continued in preparation for the Project Preliminary Design Review. The budget reduction is executed to delay the Project Preliminary Design Review until QI of FY96.

23245 (UCRL-ID–116187-95-5) **The Mixed Waste Management Facility monthly report and revised FY95 plan, May 1995.** Streit, R.D. Lawrence Livermore National Lab., CA (United States). Jun 1995. 67p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015416. Source: OSTI; NTIS; GPO Dep.

This report contains the project summary, as well as the financial summary for the Mixed Waste Management Facility at Lawrence Livermore National Laboratory. Detailed accomplishments and milestone status are reported in the Task Summaries. The major accomplishments during this reporting period are included the following areas: preliminary design; systems integration; briefings for the Environmental Programs Scientific Advisory Committee; integrated cost/scheduling estimating system; feed preparation; mediated electrochemical oxidation; and molten salt oxidation.

23246 (UCRL-ID–118561) **Review of sensors for the In situ chemical characterization of the Hanford underground storage tanks.** Kyle, K.R.; Mayes, E.L. Lawrence Livermore National Lab., CA (United States). 29 Jul 1994. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015026. Source: OSTI; NTIS; INIS; GPO Dep.

Lawrence Livermore National Laboratory (LLNL), in the Technical Task Plan (TTP) SF-2112-03 subtask 2, is responsible for the conceptual design of a Raman probe for inclusion in the in-tank cone penetrometer. As part of this task, LLNL is assigned the further responsibility of generating a report describing a review of sensor technologies other than Raman that can be incorporated in the

in-tank cone penetrometer for the chemical analysis of the tank environment. These sensors would complement the capabilities of the Raman probe, and would give information on gaseous, liquid, and solid state species that are insensitive to Raman interrogation. This work is part of a joint effort involving several DOE laboratories for the design and development of in-tank cone penetrometer deployable systems for direct UST waste characterization at Westinghouse Hanford Company (WHC) under the auspices of the U.S. Department of Energy (DOE) Underground Storage Tank Integrated Demonstration (UST-ID).

23247 (UCRL-ID–119720-Add.1) **Expedited demonstration of molten salt mixed waste treatment technology. Addendum 1.** Holtz, E.H. von; Hopper, R.W.; Adamson, M.G. Lawrence Livermore National Lab., CA (United States). 27 Apr 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95013430. Source: OSTI; NTIS; INIS; GPO Dep.

The Final Forms portion (Section 4) of the TTP SF-2410-03 final report was incomplete. This was noted under the subsection "Task Variances." The present report documents the work that was unfinished at that time, arranged in accord with the subsections of the Final Report. An assessment of the overall immobilization efficacy of polymer microencapsulation, as supported by this study, has been added. The study and demonstration of the polyethylene microencapsulation of salt residues is continuing under other auspices. A stand-alone report combining the results of the continuation with the contents of this memorandum and of Section 4 of the Final Report will be issued in later this year.

23248 (UCRL-ID–120683) **The mixed waste management facility. Project baseline revision 1.2.** Streit, R.D.; Throop, A.L. Lawrence Livermore National Lab., CA (United States). Apr 1995. 227p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015034. Source: OSTI; NTIS; GPO Dep.

Revision 1.2 to the Project Baseline (PB) for the Mixed Waste Management Facility (MWMF) is in response to DOE directives and verbal guidance to (1) Collocate the Decontamination and Waste Treatment Facility (DWTF) and MWMF into a single complex, integrate certain and overlapping functions as a cost-saving measure; (2) Meet certain fiscal year (FY) new-BA funding objectives ($15.3M in FY95) with lower and roughly balanced funding for out years; (3) Reduce Total Project Cost (TPC) for the MWMF Project; (4) Include costs for all appropriate permitting activities in the project TPC. This baseline revision also incorporates revisions in the technical baseline design for Molten Salt Oxidation (MSO) and Mediated Electrochemical Oxidation (MEO). Changes in the WBS dictionary that are necessary as a result of this rebaseline, as well as minor title changes, at WBS Level 3 or above (DOE control level) are approved as a separate document. For completeness, the WBS dictionary that reflects these changes is contained in Appendix B. The PB, with revisions as described in this document, were also the basis for the FY97 Validation Process, presented to DOE and their reviewers on March 21-22, 1995. Appendix C lists information related to prior revisions to the PB. Several key changes relate to the integration of functions and sharing of facilities between the portion of the DWTF that will house the MWMF and those portions that are used by the Hazardous Waste Management (HWM) Division at LLNL. This collocation has been directed by DOE as a cost-saving measure and has been implemented in a manner that maintains separate operational elements from a safety and permitting viewpoint. Appendix D provides background information on the decision and implications of collocating the two facilities.

23249 (UCRL-JC–120933) **Universal requisition for waste data collection.** Nisbet, B.; Gage, M. Lawrence Livermore National Lab., CA (United States). May 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9505217–1: Air & Waste Management Association Policy meeting, Washington, DC (United States), 10-12 May 1995). Order Number DE95011695. Source: OSTI; NTIS; GPO Dep.

Lawrence Livermore National Laboratory (LLNL) has developed a data management tool for information gathering that encompasses all types of waste generated by the site. It is referred to as the Universal Requisition. It can be used to record information for the following types of waste: non-hazardous, hazardous, low level radioactive, mixed, transuranic (TRU), and TRU mixed wastestreams. It provides the salient information needed for the safe handling, storage, and disposal of waste, and satisfies our regulatory, record keeping, and reporting requirements. There are forty two numbered fields on the requisition and several other fields for signatures, compatibility codes, internal tracking numbers, and other information. Not all of these fields are applicable to every type of waste. As an aid to using the Universal requisition, templates with the applicable fields highlighted in color were produced and distributed. There are six different waste type templates. Each is highlighted in a different color.

23250 (UCRL-JC–120957) **Analysis of near-field thermal and psychometric waste package environment using ventilation.** Danko, G. (Univ. of Nevada, Reno, NV (United States). Mackay School of Mines); Buscheck, T.A.; Nitao, J.J.; Saterlie, S. Lawrence Livermore National Lab., CA (United States); Nevada Univ., Reno, NV (United States). Mackay School of Mines. Mar 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ; FC08-90NV10891. (CONF-9504179–3: 6. annual international conference on high level radioactive waste management, Las Vegas, NV (United States), 30 Apr - 5 may 1995). Order Number DE95015106. Source: OSTI; NTIS; INIS; GPO Dep.

The ultimate objective of the Civilian Radioactive Waste Management System (CRWMS) Program is to safely emplace and isolate the nations' spent nuclear fuel (SNF) and radioactive wastes in a geologic repository. Radioactive waste emplaced in a geologic repository will generate heat, increasing the temperature in the repository. The magnitude of this temperature increase depends upon (1) the heat source, i.e. the thermal loading of the repository, and (2) the geologic and engineered heat transport characteristics of the repository. Thermal management techniques currently under investigation include ventilation of the emplacement drifts during the preclosure period which could last as long as 100 years. Understanding the amount of heat and moisture removed from the emplacement drifts and near-field rock by ventilation, are important in determining performance of the engineered barrier system (EBS), as well as the corrosive environment of the waste packages, and the interaction of the EBS with the near-field host rock. Since radionuclide releases and repository system performance are significantly affected by the corrosion rate related to the psychometric environment, it is necessary to predict the amount of heat and moisture that are removed from the repository horizon using a realistic model for a wide range of thermal loading. This can be realized by coupling the hydrothermal model of the rock mass to a ventilation/climate model which includes the heat and moisture transport on the rock-air interface and the dilution of water vapor in the drift. This paper deals with the development of the coupled model concept, and determination of the boundary conditions for the calculations.

23251 (UCRL-JC–120966) **The value of assessments in Lawrence Livermore National Laboratory's Waste Certification Programs.** Ryan, E.M. Lawrence Livermore National Lab., CA (United States). May 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9509131–2: 22. annual National Energy and Environmental Division education and training symposium, Charlotte, NC (United States), 17-20 Sep 1995). Order Number DE95013297. Source: OSTI; NTIS; INIS; GPO Dep.

This paper will discuss the value of assessments in Lawrence Livermore National Laboratory's Waste Certification Programs by: introducing the organization and purpose of the LLNL Waste Certification Programs for transuranic, low-level, and hazardous waste; examining the differences in internal assessment/audit requirements for these programs; discussing the values and costs of assessments in a waste certification program; presenting practical recommendations to maximize the value of your assessment programs; and presenting improvements in LLNL's waste certification processes that resulted from assessments.

23252 (UCRL-JC–120995) **Disposition of plutonium in deep boreholes.** Halsey, W.G.; Jardine, L.J.; Walter, C.E. Lawrence Livermore National Lab., CA (United States). May 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9505238–1: NATO international scientific exchange program advanced research workshop, St. Petersburg (Russian Federation), 14-17 May 1995). Order Number DE95013427. Source: OSTI; NTIS; GPO Dep.

Substantial inventories of excess plutonium are expected to result from dismantlement of U.S. and Russian nuclear weapons. Disposition of this material should be a high priority in both countries. A variety of disposition options are under consideration. One option is to place the plutonium either directly or in an immobilized form at the bottom of a deep borehole that is then sealed. Deep-borehole disposition involves placing plutonium several kilometers deep into old, stable, rock formations that have negligible free water present. Containment assurance is based on the presence of ancient groundwater indicating lack of migration and communication with the biosphere. Recovery would be extremely difficult (costly) and impossible to accomplish clandestinely.

23253 (USGS-OFR–93-89) **Ground-water altitudes and well data, Nye County, Nevada, and Inyo County, California.** Ciesnik, M.S. Geological Survey, Denver, CO (United States). 1995. 61p. Sponsored by USDOE, Washington, DC (United States);Department of the Interior, Washington, DC (United States). DOE Contract AI08-92NV10874. Order Number DE95011964. Source: OSTI; NTIS; INIS; U.S. Geological Survey, Earth Science Information Center, Box 25286, MS 517, Denver Federal Center, Denver, CO 80225(United States); GPO Dep.

This report contains ground-water altitudes and well data for wells located in Nye County, Nevada, and Inyo County, California, south of Yucca Mountain, Nevada, the potential site for a high-level nuclear waste repository. Data are from wells whose coordinates are within the Beatty and Death Valley Junction, California-Nevada maps from the US Geological Survey, scale 1:100,000 (30-minute × 60-minute quadrangle). Compilation of these data was made to provide a reference for numerical models of ground-water flow at Yucca Mountain and its vicinity. Water-level measurements were obtained from the US Geological Survey National Water Information System (NWIS) data base, and span the period of October 1951 to May 1991; most measurements were made from 1980 to 1990.

23254 (WHC-EP–0479-1) **Facility effluent monitoring plan for the tank farms facilities.** Bachand, D.D.; Crummel, G.M. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 159p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015658. Source: OSTI; NTIS; INIS; GPO Dep.

A facility effluent monitoring plan is required by the US Department of Energy for any operations that involve hazardous materials and radioactive substances that could impact employee or public safety or the environment. This document is prepared using specific guidelines. This facility effluent monitoring plan assesses effluent monitoring systems and evaluates whether they are adequate to ensure the public health and safety as specified in applicable federal, state, and local requirements. This facility effluent monitoring plan shall ensure long-range integrity of the effluent monitoring systems by requiring an update whenever a new process or operation introduces new hazardous materials or significant radioactive materials. This document must be reviewed annually even if there are no operational changes, and it must be updated as a minimum every three years.

23255 (WHC-EP–0818) **Calcination/dissolution residue treatment.** Knight, R.C. (Westinghouse Hanford Co., Richland, WA (United States)); Creed, R.F.; Patello, G.K.; Hollenberg, G.W.; Buehler, M.F.; O'Rourke, S.M.; Visnapuu, A.; McLaughlin, D.F. Westinghouse Hanford Co., Richland, WA (United States). Sep 1994. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013515. Source: OSTI; NTIS; INIS; GPO Dep.

Currently, high-level wastes are stored underground in steel-lined tanks at the Hanford site. Current plans call for the chemical pretreatment of these wastes before their immobilization in stable glass waste forms. One candidate pretreatment approach, calcination/dissolution, performs an alkaline fusion of the waste and creates a high-level/low-level partition based on the aqueous solubilities of the components of the product calcine. Literature and laboratory studies were conducted with the goal of finding a residue treatment technology that would decrease the quantity of high-level waste glass required following calcination/dissolution waste processing. Four elements, Fe, Ni, Bi, and U, postulated to be present in the high-level residue fraction were identified as being key to the quantity of high-level glass formed. Laboratory tests of the candidate technologies with simulant high-level residues showed reductive roasting followed by carbonyl volatilization to be successful in removing Fe, Ni, and Bi. Subsequent bench-scale tests on residues from calcination/dissolution processing of genuine Hanford Site tank waste showed Fe was separated with radioelement decontamination factors of 70 to 1,000 times with respect to total alpha activity. Thermodynamic analyses of the calcination of five typical Hanford Site tank waste compositions also were performed. The analyses showed sodium hydroxide to be the sole molten component in the waste calcine and emphasized the requirement for waste blending if fluid calcines are to be achieved. Other calcine phases identified in the thermodynamic analysis indicate the significant thermal reconstitution accomplished in calcination.

23256 (WHC-SA–2737) **Stress evaluation of the primary tank of a double-shell underground storage tank facility.** Atalay, M.B. (ICF Kaiser Engineers, Inc., Oakland, CA (United States)); Stine, M.D.; Farnworth, S.K. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950740–52: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95012565. Source: OSTI; NTIS; INIS; GPO Dep.

A facility called the Multi-Function Waste Tank Facility (MWTF) is being designed at the Department of Energy's Hanford site. The MWTF is expected to be completed in 1998 and will consist of six underground double-shell waste storage tanks and associated systems. These tanks will provide safe and environmentally acceptable storage capacity to handle waste generated during single-shell and double-shell tank safety mitigation and remediation activities. This paper summarizes the analysis and qualification of the primary tank structure of the MWTF, as performed by ICF Kaiser Hanford during the latter phase of Title 1 (Preliminary) design. Both computer finite element analysis (FEA) and hand calculations methods based on the so-called Tank Seismic Experts Panel (TSEP) Guidelines were used to perform the analysis and evaluation. Based on the evaluations summarized in this paper, it is concluded that the primary tank structure of the MWTF satisfies the project design requirements. In addition, the hand calculations performed using the methodologies provided in the TSEP Guidelines demonstrate that, except for slosh height, the capacities exceed the demand. The design accounts for the adverse effect of the excessive slosh height demand, i.e., inadequate freeboard, by increasing the hydrodynamic wall and roof pressures appropriately, and designing the tank for such increased pressures.

23257 (WHC-SA–2887) **In situ monitoring of grouted electrolytes.** Kahanda, G.L.M.K.S. (Brooklyn Coll., NY (United States). Dept. of Physics); Gu, Jingyan; Tomkiewicz, M.; Kruger, A.A. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95016340. Source: OSTI; NTIS; INIS; GPO Dep.

We describe conductivity measurements of grouts flooded with water and in contact with a sink that consists of pure water. The conductivity measurements were designed and carried out in parallel with present quality verification methods and standard leach test of the nuclear waste management industry. For the first time, we show that the method of replacing intrusive chemical analysis with conductivity measurements of the leaching samples yield equivalent results.

23258 (WHC-SD-C018H-ATP–004) **Project C-018H, 242-A evaporator/PUREX Plant Process Condensate Treatment Facility Instrumentation and Control (I&C).** Dupuis, A. Westinghouse Hanford Co., Richland, WA (United States). 26 May 1995. 34p.

Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014433. Source: OSTI; NTIS; INIS; GPO Dep.

This Acceptance Test Procedure (ATP) has been prepared to demonstrate that the Collection System Instrumentation & Control System for Project C-018H performs according to design. Specifically, this ATP is designed to verify the following overall system requirements: The input and outputs properly connected to the LCU terminal strips. The control system software conforms to the configuration specified by the logic diagrams, piping and instrumentation diagrams (P&ID), and the LERF operating philosophy. Testing will be performed using actual signals. If actual signals are not available, then simulated signals will be used to complete the tests.

23259 (WHC-SD-C018H-ATR–002) **Electrical/instrumentation acceptance test report for Project C-018H, 242-A Evaporator/ PUREX Plant condensate treatment facility.** Compau, R.A. Jr. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Kaiser Engineers Hanford Co., Richland, WA (United States). 1 Jun 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014425. Source: OSTI; NTIS; INIS; GPO Dep.

This project is part of the 200 Area Effluent Treatment Facility. The acceptance test procedure describes test methods for leak detection units, pump flow switches, pump level control valves, room air temperature monitor, leachate pump status contacts, basin pump status contacts, catch basin leak detector, leachate level monitors, and basin level monitors. These are all components of the C-018H Collection System.

23260 (WHC-SD-CP-OTR–153) **PFP Wastewater Sampling Facility.** Hirzel, D.R. Westinghouse Hanford Co., Richland, WA (United States). 11 May 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012578. Source: OSTI; NTIS; INIS; GPO Dep.

This test report documents the results obtained while conducting operational testing of the sampling equipment in the 225-WC building, the PFP Wastewater Sampling Facility. The Wastewater Sampling Facility houses equipment to sample and monitor the PFP's liquid effluents before discharging the stream to the 200 Area Treated Effluent Disposal Facility (TEDF). The majority of the streams are not radioactive and discharges from the PFP Heating, Ventilation, and Air Conditioning (HVAC). The streams that might be contaminated are processed through the Low Level Waste Treatment Facility (LLWTF) before discharging to TEDF. The sampling equipment consists of two flow-proportional composite samplers, an ultrasonic flowmeter, pH and conductivity monitors, chart recorder, and associated relays and current isolators to interconnect the equipment to allow proper operation. Data signals from the monitors are received in the 234-5Z Shift Office which contains a chart recorder and alarm annunciator panel. The data signals are also duplicated and sent to the TEDF control room through the Local Control Unit (LCU). Performing the OTP has verified the operability of the PFP wastewater sampling system. This Operability Test Report documents the acceptance of the sampling system for use.

23261 (WHC-SD-EN-AP–165-Rev.1) **Interim-status groundwater monitoring plan for the 216-B-63 trench. Revision 1.** Sweeney, M.D. Westinghouse Hanford Co., Richland, WA (United States). 13 Jun 1995. 81p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015656. Source: OSTI; NTIS; INIS; GPO Dep.

This document outlines the groundwater monitoring plan for interim-status detection-level monitoring of the 216-B-63 Trench. This is a revision of the initial groundwater monitoring plan prepared for Westinghouse Hanford Company (WHC) by Bjornstad and Dudziak (1989). The 216-B-63 Trench, located at the Hanford Site in south-central Washington State, is an open, unlined, earthern trench approximately 1.2 m (4 ft) wide at the bottom, 427 m (1400 ft) long, and 3 m (10 ft) deep that received wastewater containing hazardous waste and radioactive materials from B Plant, located in the 200 East Area. Liquid effluent discharge to the 216-B-63 Trench began in March 1970 and ceased in February 1992. The trench is now managed by Waste Tank Operations.

23262 (WHC-SD-EN-WP–012-Rev.1) **Groundwater screening evaluation/monitoring plan: 200 Area Treated Effluent Disposal Facility (Project W-049H). Revision 1.** Barnett, D.B.; Davis, J.D.; Collard, L.B.; Freeman, P.B.; Chou, C.J. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 225p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014429. Source: OSTI; NTIS; INIS; GPO Dep.

This report consists of the groundwater screening evaluation required by Section S.8 of the State Waste Discharge Permit for the 200 Area TEDF. Chapter 1.0 describes the purpose of the groundwater monitoring plan. The information in Chapter 2.0 establishes a water quality baseline for the facility and is the groundwater screening evaluation. The following information is included in Chapter 2.0: Facility description;Well locations, construction, and development data; Geologic and hydrologic description of the site and affected area; Ambient groundwater quality and current use; Water balance information; Hydrologic parameters; Potentiometric map, hydraulic gradients, and flow velocities; Results of infiltration and hydraulic tests; Groundwater and soils chemistry sampling and analysis data; Statistical evaluation of groundwater background data; and Projected effects of facility operation on groundwater flow and water quality. Chapter 3.0 defines, based on the information in Chapter 2.0, how effects of the TEDF on the environment will be evaluated and how compliance with groundwater quality standards will be documented in accordance with the terms and conditions of the permit. Chapter 3.0 contains the following information: Media to be monitored; Wells proposed as the point of compliance in the uppermost aquifer; Basis for monitoring well network and evidence of monitoring adequacy; Contingency planning approach for vadose zone monitoring wells; Which field parameters will be measured and how measurements will be made; Specification of constituents to be sampled and analyzed; and Specification of the sampling and analysis procedures that will be used. Chapter 4.0 provides information on how the monitoring results will be reported and the proposed frequency of monitoring and reporting. Chapter 5.0 lists all the references cited in this monitoring plan. These references should be consulted for additional or more detailed information.

23263 (WHC-SD-FF-HC–002-Rev.1) **Hazard categorization and baseline documentation for the Sodium Storage Facility. Revision 1.** Bowman, B.R. Westinghouse Hanford Co., Richland, WA (United States). 16 Jun 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95016341. Source: OSTI; NTIS; INIS; GPO Dep.

Hazard Categorization evaluation has been performed in accordance with DOE-STD-1027 for the Sodium Storage Facility at FFTF and a determination of less than Category 3 or non-nuclear has been made. Hazard Baseline Documentation has been performed in accordance with DOE-EM-STD-5502 and a determination of "Radiological Facility" has been made.

23264 (WHC-SD-SNF-ER–006-Rev.1) **105-KE Basin isolation barrier leak rate test analytical development. Revision 1.** Irwin, J.J. Westinghouse Hanford Co., Richland, WA (United States). 9 May 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015599. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides an analytical development in support of the proposed leak rate test of the 105-KE Basin. The analytical basis upon which the K-basin leak test results will be used to determine the basin leakage rates is developed in this report. The leakage of the K-Basin isolation barriers under postulated accident conditions will be determined from the test results. There are two fundamental flow regimes that may exist in the postulated K-Basin leakage: viscous laminar and turbulent flow. An analytical development is presented for each flow regime. The basic geometry and nomenclature of the postulated leak paths are denoted.

23265 (WHC-SD-SNF-PLN–007) **Plan for characterization of K Basin spent nuclear fuel and sludge.** Lawrence, L.A.; Marschman, S.C. Westinghouse Hanford Co., Richland, WA (United States). Jun 1995. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015586. Source: OSTI; NTIS; INIS; GPO Dep.

This plan outlines a characterization program that supports the accelerated Path Forward scope and schedules for the Spent Nuclear Fuel stored in the Hanford K Basins. This plan is driven by the schedule to begin fuel transfer by December 1997. The program is structured for 4 years and is limited to in-situ and laboratory examinations of the spent nuclear fuel and sludge in the K East and K West Basins. The program provides bounding behavior of the fuel, and verification and acceptability for three different sludge disposal pathways. Fuel examinations are based on two shipping campaigns for the K West Basin and one from the K East Basin. Laboratory examinations include physical condition, hydride and oxide content, conditioning testing, and dry storage behavior.

23266 (WHC-SD-SQA-CSA–20392) **CSER 95-005: PFP vertical denitration calciner.** Geiger, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014430. Source: OSTI; NTIS; INIS; GPO Dep.

The Vertical Denitrating Calciner system will stabilize certain unique solutions containing fissile salts by removing the water and nitrate ion to produce a more easily stored powder. This end is achieved by high-firing the solution in the calciner. The resultant calcine is distinguished by particles which are larger and denser than those produced by the more conventional oxalate precipitation process. This criticality safety evaluation report examines criticality safety for the denitration system, installed in glovebox 188-1 at PFP. The examination shows that, due to the incorporation of standard criticality safety design techniques, the glovebox can be maintained subcritical with minimal reliance on administrative controls. The examination also shows that, ignoring the necessary administrative controls can make a criticality possible in glovebox 188-1. Section 3.0 of this report lists the necessary administrative controls.

23267 (WHC-SD-W079-ES–001-Rev.3) **Hot sample archiving. Revision 3.** McVey, C.B. Westinghouse Hanford Co., Richland, WA (United States). 26 May 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013883. Source: OSTI; NTIS; INIS; GPO Dep.

This Engineering Study revision evaluated the alternatives to provide tank waste characterization analytical samples for a time period as recommended by the Tank Waste Remediation Systems Program. The recommendation of storing 40 ml segment samples for a period of approximately 18 months (6 months past the approval date of the Tank Characterization Report) and then composite the core segment material in 125 ml containers for a period of five years. The study considers storage at 222-S facility. It was determined that the critical storage problem was in the hot cell area. The 40 ml sample container has enough material for approximately 3 times the required amount for a complete laboratory re-analysis. The final result is that 222-S can meet the sample archive storage requirements. During the 100% capture rate the capacity is exceeded in the hot cell area, but quick, inexpensive options are available to meet the requirements.

23268 (WHC-SD-W236A-ES–014) **Multi-function Waste Tank Facility path forward engineering analysis – Technical Task 3.6, Estimate of operational risk in 200 West Area.** Coles, G.A. Westinghouse Hanford Co., Richland, WA (United States). 28 Apr 1995. 201p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012566. Source: OSTI; NTIS; INIS; GPO Dep.

Project W-0236A has been proposed to provide additional waste tank storage in the 200 East and 200 West Areas. This project would construct two new waste tanks in the 200 West Area and four new tanks in the 200 East Area, and a related project (Project W-058) would construct a new cross-site line. These projects are intended to ensure sufficient space and flexibility for continued tank farm operations, including tank waste remediation and management of unforeseen contingencies. The objective of this operational risk assessment is to support determination of the adequacy of the free-volume capacity provided by Projects W-036A and W-058 and to determine related impacts. The scope of the assessment is the 200 West Area only and covers the time period from the present to the year 2005. Two different time periods were analyzed because the new cross-site tie line will not be available until 1999. The following are key insights: success of 200 West Area tank farm operations is highly correlated to the success of the cross-site transfer line and the ability of the 200 East Area to receive waste from 200 West; there is a high likelihood of a leak on a complexed single-shell tank in the next 4 years (sampling pending); there is a strong likelihood, in the next 4 years, that some combination of tank leaks, facility upsets, and cross-site line failure will require more free tank space than is currently available in Tank 241-SY-102; in the next 4 to 10 years, there is a strong likelihood that a combination of a cross-site line failure and the need to accommodate some unscheduled waste volume will require more free tank space than is presently available in Tank 241-SY-102; the inherent uncertainty in volume projections is in the range of 3 million gallons; new million-gallon tanks increase the ability to manage contingencies and unplanned events.

23269 (WHC-SD-W252-FHA–001) **WHC-SD-W252-FHA-001, Rev. 0: Preliminary fire hazard analysis for Phase II Liquid Effluent Treatment and Disposal Facility, Project W-252.** Barilo, N.F. Westinghouse Hanford Co., Richland, WA (United States). 11 May 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013889. Source: OSTI; NTIS; INIS; GPO Dep.

A Fire Hazards Analysis was performed to assess the risk from fire and other related perils and the capability of the facility to withstand these hazards. This analysis will be used to support design of the facility.

23270 (WHC-SD-WM-ATP–128-Rev.1) **Operator coil monitoring acceptance test procedure.** Erhart, M.F. Westinghouse Hanford Co., Richland, WA (United States). 5 Jun 1995. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014423. Source: OSTI; NTIS; GPO Dep.

The readiness of the Data Acquisition and Control System (DACS) to provide monitoring and control of the Programmable Logic Controller (PLC) abort coils from the Master and RSS stations will be systematically tested during performance of this procedure. It should be noted that these are not physical abort coils but software coils controlled by the software's ladder logic. The readiness of the DACS to properly interface with the ENRAF wire level gauge installed in the SY101 storage tank will also be tested. During this test, a verification of all abort coil indications will be conducted at the DACS Development Facility in the 306E Building by injecting an input signal for each DACS sensor that has an associated abort coil until the abort coil actuates, and then ensuring that the status of the abort coil indicated at the Master and RSS stations correct. Each abort coil will also be tested to ensure that the "ENABLE" and "DISABLE" controls from the Master and RSS stations function correctly, and only with the use of proper passwords.

23271 (WHC-SD-WM-ATP–132) **In situ vapor sampling system test procedure.** Deford, D.K. Westinghouse Hanford Co., Richland, WA (United States). 19 Jun 1995. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95016327. Source: OSTI; NTIS; INIS; GPO Dep.

This test procedure verifies the adequacy of the improved in situ vapor sampling system designed for sampling of vapors in underground radioactive waste storage tanks.

23272 (WHC-SD-WM-DA–148) **Structural evaluation of mixer pump installed in Tank 241-AN-107 for caustic addition project.** Leshikar, G.A. Westinghouse Hanford Co., Richland, WA (United States). 16 Jun 1995. 131p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015790. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the structural analysis and evaluation of a mixer pump and caustic addition system to be used in Tank 107-AN. This pump will be installed in the central pump pit of this double- shell tank for the purpose of bringing the hydroxide ion concentration into compliance with Tank Farm operating specifications.

23273 (WHC-SD-WM-DA–196) **Structural analysis of 241C106 contingency chiller design.** Graves, C.E.; Coverdell,

B.L.; Nawarynsky, D.A.; Rensink, G.E. Westinghouse Hanford Co., Richland, WA (United States). 26 May 1995. 152p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014422. Source: OSTI; NTIS; INIS; GPO Dep.

As part of the Tank 24ICI06 leak contingency plan, a chiller coil is to be installed on the existing HEPA-filtered air inlet unit. A natural phenomenon-hazard analysis per SDC 4.1, Standard Architectural-Civil Design Criteria, Design Loads for Facilities, Revision 12, was performed on several components of the design using both hand calculations and COSMOS/M computer models. The design meets SOC 4.1 requirements for safety class 3 equipment.

23274 (WHC-SD-WM-DP–107) **45-Day safety screen results for Tank 241-U-201, push mode, cores 70, 73 and 74.** Sathyanarayana, P. Westinghouse Hanford Co., Richland, WA (United States). 4 May 1995. 99p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012568. Source: OSTI; NTIS; INIS; GPO Dep.

Three core samples, each having two segments, from Tank 241-U-201 (U-201) were received by the 222-S Laboratories. Safety screening analysis, such as differential scanning calorimetry (DSC), thermogravimetric analysis (TGA), and total alpha activity were conducted on Core 70, Segment 1 and 2 and on Core 73, Segment 1 and 2. Core 74, Segment 1 and 2 were taken to test rotary bit in push mode sampling. No analysis was requested on Core 74, Segment 1 and 2. Analytical results for the TGA analyses for Core 70, Segment 1, Upper half solid sample was less than the safety screening notification limit of 17 percent water. Notification was made on April 27, 1995. No exotherm was associated with this sample. Analytical results are presented in Tables 1 to 4, with the applicable notification limits shaded.

23275 (WHC-SD-WM-DP–111) **45-Day safety screen results for Tank 241-C-101, auger sample 95-AUG-019.** Sasaki, L.M. Westinghouse Hanford Co., Richland, WA (United States). 11 May 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012586. Source: OSTI; NTIS; INIS; GPO Dep.

One auger sample from Tank 241-C-101 was received by the 222-S Laboratory and underwent safety screening analyses–differential scanning calorimetry (DSC), thermogravimetric analysis (TGA), and total alpha analysis–in accordance with the tank characterization plan. Analytical results for the TGA on the crust sample (the uppermost portion of the auger sample) (sample number S95T000823) were less than the safety screening notification limit of 17 weight percent water. Verbal and written notifications were made on May 3, 1995. No exotherms were observed in the DSC analyses and the total alpha results were well below the safety screening notification limit. This report includes the primary safety screening results obtained from the analyses and copies of all DSC and TGA raw data scans as requested per the TCP. Although not included in this report, a photograph of the extruded sample was taken and is available. This report also includes bulk density measurements required by Characterization Plant Engineering. Additional analyses (pH, total organic carbon, and total inorganic carbon) are being performed on the drainable liquid at the request of Characterization Process Control; these analyses will be reported at a later date in a final report for this auger sample. Tank C-101 is not part of any of the four Watch Lists.

23276 (WHC-SD-WM-DP–114) **60-day safety screen results and final report for tank 241-C-111, auger samples 95-Aug-002, 95-Aug-003, 95-Aug-016, and 95-Aug-017.** Rice, A.D. Westinghouse Hanford Co., Richland, WA (United States). 30 May 1995. 280p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014307. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the auger sampling events for underground waste tank C-111. The samples were shipped to the 222-S laboratories were they underwent safety screening analysis and primary ferricyanide analysis. The samples were analyzed for alpha total, total organic carbon, cyanide, Ni, moisture, and temperature differentials. The results of this analysis are presented in this document.

23277 (WHC-SD-WM-DP–115) **45-day safety screen results for tank 241-C-204, auger samples 95-Aug-022 and 95-Aug-023.** Conner, J.M. Westinghouse Hanford Co., Richland, WA (United States). 15 Aug 1995. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95016330. Source: OSTI; NTIS; INIS; GPO Dep.

Two auger samples from tank 241-C-204 (C-204) were received at the 222-S Laboratories and underwent safety screening analysis, consisting of differential scanning calorimetry (DSC), thermogravimetric analysis (TGA), and total alpha activity. The three samples submitted to energetics determination by DSC exceeded the notification limit. As required by the Tank Characterization Plan, the appropriate notifications were made within 24 hours of official confirmation that the limit was exceeded. Secondary analyses have been initiated. Results from secondary analyses will be included in a revision to this report.

23278 (WHC-SD-WM-DP–132) **45-day safety screen results and final report for tank 241-C-202, auger samples 95-Aug-026 and 95-Aug-027.** Baldwin, J.H. Westinghouse Hanford Co., Richland, WA (United States). 19 Jun 1995. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95016329. Source: OSTI; NTIS; INIS; GPO Dep.

Two auger samples from tank 241-C-202 (C-202) were received at the 222-S Laboratories and underwent safety screening analysis, consisting of differential scanning calorimetry (DSC), thermogravimetric analysis (TGA), and total alpha activity. Two samples were submitted for energetics determination by DSC. Within the triplicate analyses of each sample, one of the results for energetics exceeded the notification limit. The sample and duplicate analyses for both augers exceeded the notification limit for TGA. As required by the Tank Characterization Plan, the appropriate notifications were made within 24 hours of official confirmation that the limits were violated.

23279 (WHC-SD-WM-ER–350) **Historical tank content estimate for the southeast quadrant of the Hanford 200 Areas.** ICF Kaiser Hanford Co., Richland, WA (United States). Jun 1995. 310p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015546. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides historical evaluations of the radioactive and mixed waste stored in the Hanford site underground double-shell tanks. A Historical Tank Content Estimate has been developed by reviewing the process histories, waste transfer data, and available physical and chemical characterization data from various Department of Energy and Department of Defense contractors. The historical data will supplement information that is currently being gathered from core sampling. Historical waste transfer and level data, tank physical information, temperature data, and sampling data have been compiled for this report and supporting documents.

23280 (WHC-SD-WM-ER–366) **Tank characterization report for Double-Shell Tank 241-SY-102.** DiCenso, A.T. (Los Alamos Technical Associates, Inc., NM (United States)); Amato, L.C.; Winters, W.I. Westinghouse Hanford Co., Richland, WA (United States). 9 Jun 1995. 94p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014306. Source: OSTI; NTIS; INIS; GPO Dep.

This tank characterization report presents an overview of Double-Shell Tank 241-SY-102 (hereafter, Tank 241-SY-102) and its waste contents. It provides estimated concentrations and inventories for the waste components based on the latest sampling and analysis activities and background tank information. This report describes the results of three sampling events. The first core sample was taken in October 1988. The tank supernate and sludge were next core sampled in February and March of 1990 (Tingey and Sasaki 1995). A grab sample of the supernate was taken in March of 1994. Tank 241-SY-102 is in active service and can be expected to have additional transfers to and from the tank that will alter the composition of the waste. The concentration and inventory estimates reported in this document no longer reflect the exact composition of the waste but represent the best estimates based

on the most recent and available data. This report supports the requirements of the Hanford Federal Facility Agreement and Consent Order Milestone M-44-08 (Ecology, EPA, DOE 1994).

23281 (WHC-SD-WM-ER–418) **Tank 241-BY-104 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 10 May 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012592. Source: OSTI; NTIS; INIS; GPO Dep.

Tank BY-104 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. Tank BY-104 using the vapor sampling system (VSS) on June 24, 1994 by WHC Sampling and Mobile Laboratories. Air from the tank BY-104 headspace was withdrawn via a heated sampling probe mounted in riser 10A, and transferred via heated tubing to the VSS sampling manifold. Sampling media were prepared and analyzed by WHC, Oak Ridge National Laboratories, Pacific Northwest Laboratories, and Oregon Graduate Institute of Science and Technology through a contract with Sandia National Laboratories. The 46 tank air samples and 2 ambient air control samples collected are listed in Table X-1 by analytical laboratory. Table X-1 also lists the 10 trip blanks provided by the laboratories.

23282 (WHC-SD-WM-ER–419) **Tank 241-BY-105 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 10 May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012591. Source: OSTI; NTIS; INIS; GPO Dep.

Tank BY-105 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. Tank BY-105 is on the Ferrocyanide Watch List. Samples were collected from Tank BY-105 using the vapor sampling system (VSS) on July 7, 1994 by WHC Sampling and Mobile Laboratories. The tank headspace temperature was determined to be 26 C. Air from the Tank BY-105 headspace was withdrawn via a heated sampling probe mounted in riser 10A, and transferred via heated tubing to the VSS sampling manifold. All heated zones of the VSS were maintained at approximately 65 C. Sampling media were prepared and analyzed by WHC, Oak Ridge National Laboratories, Pacific Northwest Laboratories, and Oregon Graduate Institute of Science and Technology through a contract with Sandia National Laboratories. The 46 tank air samples and 2 ambient air control samples collected are listed in Table X-1 by analytical laboratory. Table X-1 also lists the 10 trip blanks provided by the laboratories.

23283 (WHC-SD-WM-ER–420) **Tank 241-BY-106 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 10 May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012571. Source: OSTI; NTIS; INIS; GPO Dep.

Tank BY-106 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. Tank BY-106 is on the Ferrocyanide Watch List. Samples were collected from Tank BY-106 using the vapor sampling system (VSS) on July 8, 1994 by WHC Sampling and Mobile Laboratories. The tank headspace temperature was determined to be 27 C. Air from the Tank BY-106 headspace was withdrawn via a heated sampling probe mounted in riser 10B, and transferred via heated tubing to the VSS sampling manifold. All heated zones of the VSS were maintained at approximately 65 C. Sampling media were prepared and analyzed by WHC, Oak Ridge National Laboratories, Pacific Northwest Laboratories, and Oregon Graduate Institute of Science and Technology through a contract with Sandia National Laboratories. The 46 tank air samples and 2 ambient air control samples collected are listed in Table X-1 by analytical laboratory. Table X-1 also lists the 10 trip blanks provided by the laboratories.

23284 (WHC-SD-WM-ER–422) **Tank 241-BY-108 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 10 May 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012585. Source: OSTI; NTIS; INIS; GPO Dep.

Tank BY-108 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. Tank BY-108 is on the Ferrocyanide Watch List. Samples were collected from Tank BY-108 using the vapor sampling system (VSS) on october 27, 1994 by WHC Sampling and Mobile Laboratories. The tank headspace temperature was determined to be 25.7 C. Air from the Tank BY-108 headspace was withdrawn via a 7.9 m-long heated sampling probe mounted in riser 1, and transferred via heated tubing to the VSS sampling manifold. All heated zones of the VSS were maintained at approximately 50 C. Sampling media were prepared and analyzed by WHC, Oak Ridge National Laboratories, and Pacific Northwest Laboratories. The 40 tank air samples and 2 ambient air control samples collected are listed in Table X-1 by analytical laboratory. Table X-1 also lists the 14 trip blanks and 2 field blanks that accompanied the samples.

23285 (WHC-SD-WM-ER–425) **Tank 241-C-111 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 10 May 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012593. Source: OSTI; NTIS; INIS; GPO Dep.

Tank C-111 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. Results presented here represent the best available data on the headspace constituents of Tank C-111. Almost all of the data in this report was obtained from samples collected on September 13, 1994.Data from 2 other sets of samples, collected on August 10, 1993 and June 20, 1994, are in generally good agreement with the more recent data. The tank headspace temperature was determined to be 27 C. Air from the Tank C-111 headspace was withdrawn via a 7.9 m-long heated sampling probe mounted in riser 6, and transferred via heated tubing to the VSS sampling manifold. All heated zones of the VSS were maintained at approximately 50 C. Sampling media were prepared and analyzed by WHC, Oak Ridge National Laboratories, Pacific Northwest Laboratories, and Oregon Graduate Institute of Science and Technology through a contract with Sandia National Laboratories. The 39 tank air samples and 2 ambient air control samples collected are listed in Table X-1 by analytical laboratory. Table X-1 also lists the 14 trip blanks provided by the laboratories. Tank C-111 is a single shell tank which received first-cycle decontamination waste from B Plant and was later used as a settling tank.

23286 (WHC-SD-WM-ER–426) **Tank 241-C-112 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 10 May 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012594. Source: OSTI; NTIS; INIS; GPO Dep.

Tank C-112 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. Tank C-112 is a single-shell tank which received first-cycle decontamination waste from B Plant and was later used as a settling tank. Samples were collected from Tank C-112 using the vapor sampling system (VSS) on August 11, 1994 by WHC Sampling and Mobile Laboratories. The tank headspace temperature was determined to be 28 C. Air from the Tank C-112 headspace was withdrawn via a 7.9 m-long heated sampling probe mounted in riser 4, and transferred via heated tubing to the VSS sampling manifold. All heated zones of the VSS were maintained at approximately 50 C. Sampling media were prepared and analyzed by WHC, Oak Ridge National Laboratories, Pacific Northwest Laboratories, and Oregon Graduate Institute of Science and Technology through a contract with Sandia National Laboratories. The 39 tank air samples and 2 ambient air control samples collected are listed in Table X-1 by analytical laboratory. Table X-1 also lists the 14 trip blanks and 2 field blanks provided by the laboratories.

23287 (WHC-SD-WM-ER–427) **Tank 241-C-106 process test report.** Bander, T.J. Westinghouse Hanford Co., Richland, WA (United States). 30 May 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014316. Source: OSTI; NTIS; INIS; GPO Dep.

This report evaluates the thermal hydraulic behavior of tank C-106 during and following the process test conducted from March 10, 1994 to June 15, 1994. During and following the process test the thermocouples on the thermocouple tree in riser No. 14 began to indicate significantly higher temperatures in the sludge than the low temperatures typically observed at this location. The thermocouples on the thermocouple tree in riser No. 8 during this same time period indicated temperature variations consistent with normal seasonal effects. This report summarizes the analyses conducted to understand the phenomena that caused the temperature history at riser No. 14.

23288 (WHC-SD-WM-ER–428) **Tank 241-BY-103 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 5 May 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012824. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-BY-103 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. The drivers and objectives of waste tank headspace sampling and analysis are discussed in "Program Plan for the Resolution of Tank Vapor Issues." Tank 241-BY-103 was vapor sampled in accordance with "Data Quality Objectives for Generic In-Tank Health and Safety Issue Resolution."

23289 (WHC-SD-WM-ER–429) **Tank 241-BY-110 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 10 May 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012595. Source: OSTI; NTIS; INIS; GPO Dep.

Tank BY-110 headspace gas and vapor samples were collected and analyzed to help determine the potential risks to tank farm workers due to fugitive emissions from the tank. Tank BY-110 is on the Ferrocyanide Watch List. Samples were collected from Tank BY-110 using the vapor sampling system (VSS) on November 11, 1994 by WHC Sampling and Mobile Laboratories. The tank headspace temperature was determined to be 27 C. Air from the Tank BY-110 headspace was withdrawn via a 7.9 m-long heated sampling probe mounted in riser 12B, and transferred via heated tubing to the VSS sampling manifold. All heated zones of the VSS were maintained at approximately 50 C. Sampling media were prepared and analyzed by WHC, Oak Ridge National Laboratories, and Pacific Northwest Laboratories. The 40 tank air samples and 2 ambient air control samples collected are listed in Table X-1 by analytical laboratory. Table X-1 also lists the 14 trip blanks and 2 field blanks that accompanied the samples.

23290 (WHC-SD-WM-ER–430) **Waste tank headspace gas and vapor characterization reference guide.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012823. Source: OSTI; NTIS; INIS; GPO Dep.

This document is to serve as a reference guide for gas and vapor sample results presented in tank characterization reports. It describes sampling equipment, devices, and protocols, and sample collection and analysis methods common to all vapor samples.

23291 (WHC-SD-WM-ER–432) **Evaluation of remaining life of the double-shell tank waste systems.** Schwenk, E.B. Westinghouse Hanford Co., Richland, WA (United States). 4 May 1995. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012789. Source: OSTI; NTIS; INIS; GPO Dep.

A remaining life assessment of the DSTs (double-shell tanks) and their associated waste transfer lines, for continued operation over the next 10 years, was favorable. The DST assessment was based on definition of significant loads, evaluation of data for possible material degradation and geometric changes and evaluation of structural analyses. The piping assessment was based primarily on service experience.

23292 (WHC-SD-WM-ER–436) **Dropping of mixing pump in Tank 102-AP.** Jimenez, R.F. Westinghouse Hanford Co., Richland, WA (United States). 2 Jun 1995. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95016334. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this study is to examine dropping of the mixing pump in Tank 102-AP during its removal poses the risk of causing a leak in the tank bottom with attendant potential for public exposure from the leak. The purpose of this investigation is to examine the potential for causing such a leak (i.e., estimated frequency of leak occurrence); to qualitatively estimate leak magnitude if its is a credible event; and, finally to compare the worker hazard, in the installation of an impact limiter (should it be required), to that which the public might incur if a leak is manifest in the tank bottom. The ultimate goal of the study is, of course, to assess the need for installation of an impact limiter.

23293 (WHC-SD-WM-ER–450) **Tank 241-U-106 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013911. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the details of the Hanford waste tank characterization study for tank 241-U-106. The drivers and objectives of the headspace vapor sampling and analysis were in accordance with procedures that were presented in other reports. The vapor and headspace gas samples were collected to determine the potential risks to tank farm workers due to fugitive emissions from the tank.

23294 (WHC-SD-WM-ER–458) **Tank 241-C-101 vapor sampling and analysis tank characterization report.** Huckaby, J.L. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013881. Source: OSTI; NTIS; INIS; GPO Dep.

Tank C-101 headspace gas and vapor samples were collected and analyzed to help determine the potential risks of fugitive emissions to tank farm workers. Gas and vapor samples from the Tank C-101 headspace were collected on July 7, 1994 using the in situ sampling (ISS) method, and again on September 1, 1994 using the more robust vapor sampling system (VSS). Gas and vapor concentrations in Tank C-101 are influenced by its connections to other tanks and its ventilation pathways. At issue is whether the organic vapors in Tank C-101 are from the waste in that tank, or from Tanks C-102 or C-103. Tank C-103 is on the Organic Watch List; the other two are not. Air from the Tank C-101 headspace was withdrawn via a 7.9-m long heated sampling probe mounted in riser 8, and transferred via heated tubing to the VSS sampling manifold. The tank headspace temperature was determined to be 34.0 C, and all heated zones of the VSS were maintained at approximately 50 C. Sampling media were prepared and analyzed by WHC, Oak Ridge National Laboratories, Pacific Northwest Laboratories, and Oregon Graduate Institute of Science and Technology through a contract with Sandia National Laboratories. The 39 tank air samples and 2 ambient air control samples collected are listed in Table X-1 by analytical laboratory. Table X-1 also lists the 14 trip blanks and 2 field blanks provided by the laboratories.

23295 (WHC-SD-WM-ES–325) **Pre-1970 transuranic solid waste at the Hanford Site.** Greenhalgh, W.O. Westinghouse Hanford Co., Richland, WA (United States). 23 May 1995. 67p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015784. Source: OSTI; NTIS; INIS; GPO Dep.

The document is based on a search of pre-1970 Hanford Solid Waste Records. The available data indicates seven out of thirty-one solid waste burial sites used for pre-1970 waste appear to be Transuranic (TRU). A burial site defined to be TRU contains >100 nCi/gm Transuranic nuclides.

23296 (WHC-SD-WM-ES–331) **Identification of potential transuranic waste tanks at the Hanford Site.** Colburn, R.P. Westinghouse Hanford Co., Richland, WA (United States). 5 May 1995. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012567. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to identify potential transuranic (TRU) material among the Hanford Site tank wastes for possible disposal at the Waste Isolation Pilot Plant (WIPP) as an alternative to disposal in the high-level waste (HLW) repository. Identification of such material is the initial task in a trade study suggested in WHC-EP-0786, Tank Waste Remediation System Decisions and Risk Assessment (Johnson 1994). The scope of this document is limited to the identification of those tanks that might be segregated from the HLW for disposal as TRU, and the bases for that selection. It is assumed that the tank waste will be washed to remove soluble inert material for disposal as low-level waste (LLW), and the washed residual solids will be vitrified for disposal. The actual recommendation of a disposal strategy for these materials will require a detailed cost/benefit analysis and is beyond the scope of this document.

23297 (WHC-SD-WM-ES–343) **Moisture monitoring and control system engineering study.** Carpenter, K.E.; Fadeff, J.G. Westinghouse Hanford Co., Richland, WA (United States). 16 May 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012588. Source: OSTI; NTIS; INIS; GPO Dep.

During the past 50 years, a wide variety of chemical compounds have been placed in the 149 single-shell tanks (SSTS) on the Hanford Site. A concern relating to chemical stability, chemical control, and safe storage of the waste is the potential for propagating reactions as a result of ferrocyanide-oxidizer and organic-oxidizer concentrations in the SSTS. Propagating reactions in fuel-nitrate mixtures are precluded if the amounts of fuel and moisture present in the waste are within specified limits. Because most credible ignition sources occur near the waste surface, the main emphasis of this study is toward monitoring and controlling moisture in the top 14 cm (5.5 in.) of waste. The purpose of this engineering study is to recommend a moisture monitoring and control system for use in SSTs containing sludge and saltcake. This study includes recommendations for: (1) monitoring and controlling moisture in SSTs; (2) the fundamental design criteria for a moisture monitoring and control system; and (3) criteria for the deployment of a moisture monitoring and control system in hanford Site SSTs. To support system recommendations, technical bases for selecting and using a moisture monitoring and control system are presented. Key functional requirements and a conceptual design are included to enhance system development and establish design criteria.

23298 (WHC-SD-WM-ES–345) **Development and determination of a single-shell tank interim stabilization pumping strategy.** Garvin, L.J.; Kujak, S.K. ICF Kaiser Hanford Co., Richland, WA (United States). 12 Jun 1995. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015819. Source: OSTI; NTIS; INIS; GPO Dep.

This activity plan addresses the technique and steps involved in simulating a riser installation in the dome of a single-shell waste storage tank by the used of a rotary drill rig. This simulation will provide information to avoid potential inadequacies in planning and field efforts in a nonradiological environment. Personnel can be trained in a nonradiological environmental while perfecting techniques for drilling and installing risers. It is essential that field equipment and installation procedures be perfected before the installation of risers in SSTs occurs. Time spent installing the actual risers in the SSTs will be minimized, aiding in safety of personnel and conformance to ALARA principles.

23299 (WHC-SD-WM-FRD–021) **Functions and requirements for Hanford single-shell tank leakage detection and monitoring.** Cruse, J.M.; Ohl, P.C. Westinghouse Hanford Co., Richland, WA (United States). 19 Apr 1995. 176p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011506. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the initial functions and requirements for leakage detection and monitoring applicable to past and potential future leakage from the Hanford Site's 149 single-shell high-level waste tanks. This mission is a part of the overall mission of the Westinghouse Hanford Company Tank Waste Remediation System division to remediate the tank waste in a safe and acceptable manner. Systems engineering principles are being applied to this effort. This document reflects the an initial step in the systems engineering approach to decompose the mission into primary functions and requirements. The document is considered approximately 30% complete relative to the effort required to produce a final version that can be used to support demonstration and/or procurement of technologies. The functions and requirements in this document apply to detection and monitoring of below ground leaks from SST containment boundaries and the resulting soil contamination. Leakage detection and monitoring is invoked in the TWRS Program in three fourth level functions: (1) Store Waste, (2) Retrieve Waste, and (3) Disposition Excess Facilities (as identified in DOE/RL-92-60 Rev. 1, Tank Waste Remediation System Functions and Requirements).

23300 (WHC-SD-WM-PAP–062-Rev.1) **Statements of work for FY 1996 to 2001 for the Hanford Low-Level Tank Waste Performance Assessment Project.** Mann, F.M. Westinghouse Hanford Co., Richland, WA (United States). 7 Jun 1995. 292p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015748. Source: OSTI; NTIS; INIS; GPO Dep.

The statements of work for each activity and task of the Hanford Low-Level Tank Waste Performance Assessment project are given for the fiscal years 1996 through 2001. The end product of this program is approval of a final performance assessment by the Department of Energy in the year 2000.

23301 (WHC-SD-WM-PCP–010) **Process control plan for 242-A Evaporator Campaign 95-1.** Le, E.Q.; Guthrie, M.D. Westinghouse Hanford Co., Richland, WA (United States). 18 May 1995. 235p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013334. Source: OSTI; NTIS; INIS; GPO Dep.

The wastes from tanks 106-AP, 107-AP, and 106-AW have been selected to be candidate feed wastes for Evaporator Campaign 95-1. The wastes in tank 106-AP and 107-AP are primarily from B-Plant strontium processing and PUREX neutralized cladding removal, respectively. The waste in tank 106-AW originated primarily from the partially concentrated product from 242-A Evaporator Campaign 94-2. Approximately 8.67 million liters of waste from these tanks will be transferred to tank 102-AW during the campaign. Tank 102-AW is the dedicated waste feed tank for the evaporator and currently contains 647,000 liters of processable waste. The purpose of the 242-A Evaporator Campaign 95-1 Process Control Plan (hereafter referred to as PCP) is to certify that the wastes in tanks 106-AP, 107-AP, 102-AW, and 106-AW are acceptable for processing through evaporator and provide a general description of process strategies and activities which will take place during Campaign 95-1. The PCP also summarizes and presents a comprehensive characterization of the wastes in these tanks.

23302 (WHC-SD-WM-QAPP–009-Rev.2) **242-A Evaporator quality assurance plan. Revision 2.** Basra, T.S. Westinghouse Hanford Co., Richland, WA (United States). 4 May 1995. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012575. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this quality assurance project plan (Plan) is to provide requirements for activities pertaining to sampling, shipping, and analyses associated with candidate feed tank samples for the 242-A Evaporator project. The purpose of the 242-A Evaporator project is to reduce the volume of aqueous waste in the Double Shell Tank (DST) System and will result in considerable savings to the disposal of mixed waste. The 242-A Evaporator feed stream originates from DSTs identified as candidate feed tanks. The 242-A Evaporator reduces the volume of aqueous waste contained in DSTs by boiling off water and sending the condensate (called process condensate) to the Liquid Effluent Retention Facility (LEPF) storage basin where it is stored prior to treatment in the Effluent

Treatment Facility (ETF). The objective of this quality assurance project plan is to provide the planning, implementation, and assessment of sample collection and analysis, data issuance, and validation activities for the candidate feed tanks.

23303 (WHC-SD-WM-RPT–159) **Disposal facility data for the interim performance.** Eiholzer, C.R. Westinghouse Hanford Co., Richland, WA (United States). 15 May 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013360. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to identify and provide information on the waste package and disposal facility concepts to be used for the low-level waste tank interim performance assessment. Current concepts for the low-level waste form, canister, and the disposal facility will be used for the interim performance assessment. The concept for the waste form consists of vitrified glass cullet in a sulfur polymer cement matrix material. The waste form will be contained in a 2 x 2 x 8 meter carbon steel container. Two disposal facility concepts will be used for the interim performance assessment. These facility concepts are based on a preliminary disposal facility concept developed for estimating costs for a disposal options configuration study. These disposal concepts are based on vault type structures. None of the concepts given in this report have been approved by a Tank Waste Remediation Systems (TWRS) decision board. These concepts will only be used in th interim performance assessment. Future performance assessments will be based on approved designs.

23304 (WHC-SD-WM-RPT–160) **Survey package: Technical and contracting strategies for single-shell tank waste retrieval on the Hanford Site.** Ramsower, D.C. Westinghouse Hanford Co., Richland, WA (United States). 25 May 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013906. Source: OSTI; NTIS; INIS; GPO Dep.

Westinghouse Hanford Company is interested in innovative, commercially available or adaptable retrieval system equipment, concepts, and contracting strategies that will ad to existing Hanford Site technology and significantly reduce cost and/or risk from the baseline retrieval approach of sluicing (hydraulically mining) the waste from the SSTs onsite. The objective of this request is to gather information from industry to identify and summarize a suite of retrieval-related components, systems, and contracting approaches. This information will be used to ensure that WHC understands the various waste retrieval alternative approaches, their risks, and their application on the Hanford Site tanks for those occasions when sluicing is not sufficiently effective, appropriate, or cost-effective. An additional objective is to facilitate industry's understanding of the tank and site interface requirements for SST waste retrieval and the complex statutory, legal, regulatory, labor, and other institutional standards being applied to the Hanford Site. This effort will identify and summarize retrieval solutions by the end of September 1996 so that a clear basis for future retrieval program decisions can be established.

23305 (WHC-SD-WM-TI–640) **Double shell tanks plutonium inventory assessment.** Tusler, L.A. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014319. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides an evaluation that establishes plutonium inventory estimates for all DSTs based on known tank history information, the DST plutonium inventory tracking system, tank characterization measurements, tank transfer records, and estimated average concentration values for the various types of waste. These estimates use data through December 31, 1994, and give plutonium estimates as of January 1, 1995. The plutonium inventory values for the DSTs are given in Section 31. The plutonium inventory estimate is 224 kg for the DSTs and 854 kg for the SSTs for a total of 1078 kg. This value compares favorably with the total plutonium inventory value of 981 kg obtained from the total plutonium production minus plutonium recovery analysis estimates.

23306 (WHC-SD-WM-TI–684) **Waste characterization of the 101-SY hydrogen mitigation mixing pump shipping container.** Gedeon, S.R. Westinghouse Hanford Co., Richland, WA (United States). 19 May 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013347. Source: OSTI; NTIS; INIS; GPO Dep.

The Hydrogen Mitigation Mixing Pump (HMMP) in Tank 241-SY-101 will need to be removed at some point. At that time, the HMMP will be placed in a shipping container and transferred to a designated onsite location depending on waste classification. This report shows how the radioactive material content of shipping container will be determined. Once the radioactive material loading is known, the waste classification of the container may be determined in accordance with established procedures.

23307 (WHC-SD-WM-TI–691) **Strategy for resolution of the Flammable Gas Safety Issue.** Johnson, G.D. Westinghouse Hanford Co., Richland, WA (United States). 25 Apr 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95011507. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to provide the general strategy for resolution of the flammable gas safety issue; it is not a detailed description of program activities. budgets and schedules. Details of the program activities have been issued (Johnson and Sherwood, 1994) and the information pertaining to budgets is provided in the FY 1995-1997 Multi-Year Work Plan for Tank Waste Remediation System (TWRS) (Program Element 1.1.1.2.02.). The key element in this strategy is to provide an understanding of the behavior of each of the Flammable Gas Watch List tanks. While a review of historical information does provide some insight, it is necessary to gather current information about the gases, behavior and nature of the waste,. and about the control systems that maintain and monitor the waste. Analysis of this information will enable TWRS to determine the best approach to place any tank in a safe condition, if it is found to be in an unsafe state.

23308 (WHC-SD-WM-TI–705) **Solid waste handling.** Parazin, R.J. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014305. Source: OSTI; NTIS; INIS; GPO Dep.

This study presents estimates of the solid radioactive waste quantities that will be generated in the Separations, Low-Level Waste Vitrification and High-Level Waste Vitrification facilities, collectively called the Tank Waste Remediation System Treatment Complex, over the life of these facilities. This study then considers previous estimates from other 200 Area generators and compares alternative methods of handling (segregation, packaging, assaying, shipping, etc.).

23309 (WHC-SD-WM-TP–169) **Liquid Effluent Monitoring Information System test plans releases 2.0 and 3.0.** Guettler, D.A. Westinghouse Hanford Co., Richland, WA (United States). 26 May 1995. 590p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014427. Source: OSTI; NTIS; INIS; GPO Dep.

The Liquid Effluent Monitoring Information System (LEMIS) is being developed as the organized information repository facility in support of the liquid effluent monitoring requirements of the Tri-Party Agreement. It is necessary to provide an automated repository into which the results from liquid effluent sampling will be placed. This repository must provide for effective retention, review, and retrieval of selected sample data by authorized persons and organizations. This System Architecture document is the aggregation of the DMR P+ methodology project management deliverables. Together they represent a description of the project and its plan through four Releases, corresponding to the definition and prioritization of requirements defined by the user.

23310 (WHC-SD-WM-TRP–224) **Ignitability testing for core drilling system. Final report.** Cashdollar, K.L. (Bureau of Mines, Pittsburgh, PA (United States). Pittsburgh Research Center); Furno, A.; Green, G.M.; Thomas, R.A.; Witwer, K.S. Westinghouse Hanford Co., Richland, WA (United States); Bureau of Mines, Pittsburgh, PA (United States). Pittsburgh Research Center. 15 Jun

1995. 207p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95016332. Source: OSTI; NTIS; INIS; GPO Dep.

As part of a study of the hazards of the inspection of nuclear waste material stored at the Hanford, WA site, the Department of Energy (DOE) and Westinghouse Hanford Company (WHC) have developed a core drilling system to sample the material in large waste storage tanks. In support of this work, the US Bureau of Mines has studied the probability of ignition while core drilling into simulated salt cake that was permeated with a flammable gas mixture. No ignitions were observed while core drilling into the salt-cake with or without a purge gas and no ignitions were observed while drilling into a steel plate.

23311 (WHC-SD-WM-TSAP–002) **Tank 241-B-106 push mode core sampling and analysis plan.** Conner, J.M. Westinghouse Hanford Co., Richland, WA (United States). 15 Jun 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015792. Source: OSTI; NTIS; INIS; GPO Dep.

This sampling and analysis plan identifies characterization objectives pertaining to sample collection, laboratory analytical evaluation, and reporting requirements in accordance with the Tank Safety Screening Data Quality Objective. This quality objective is part of the tank characterization plan for tank 241-B-106. This report also identifies procedures and requirements for collecting and characterizing samples form tank 241-B-106 by the push mode core sampling method.

23312 (WHC-SD-WM-VI–021) **Test Plan: Phase 1 demonstration of 3-phase electric arc melting furnace technology for vitrifying high-sodium content low-level radioactive liquid wastes.** Eaton, W.C. (ed.). Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 55p. Sponsored by USDOE, Washington, DC (United States);Department of the Interior, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014303. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides a test plan for the conduct of electric arc vitrification testing by a vendor in support of the Hanford Tank Waste Remediation System (TWRS) Low-Level Waste (LLW) Vitrification Program. The vendor providing this test plan and conducting the work detailed within it [one of seven selected for glass melter testing under Purchase Order MMI-SVV-384216] is the US Bureau of Mines, Department of the Interior, Albany Research Center, Albany, Oregon. This test plan is for Phase I activities described in the above Purchase Order. Test conduct includes feed preparation activities and melting of glass with Hanford LLW Double-Shell Slurry Feed waste simulant in a 3-phase electric arc (carbon electrode) furnace.

23313 (WHC-SD-WM-WP–303) **Half-liter supernatant sampler system engineering work plan.** Ritter, G.A. Westinghouse Hanford Co., Richland, WA (United States). 6 Jun 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014406. Source: OSTI; NTIS; INIS; GPO Dep.

The Tank Waste Remediation System (TWRS) pretreatment facility project W-236B, known as the Initial Pretreatment Module (IPM), requires samples of supernatants and sludges from 200 Area tank farms for planned hot testing work in support of IPM design. The IPM project has proposed the development of several new sampler systems. These systems include a 0.5-l supernatant sampler, 3-l and 25-l supernatant and sludge samplers, and a 4,000-l sampler system. The 0.5-l sampler will support IPM sampling needs in the 1 to 3 l range starting in late fiscal year 1995. This sampler is intended to be used in conjunction with the existing 100 ml bottle-on-a-string. The 3-l and 25-l systems will be based on the Savannah River Site's sampler system and will support IPM sampling needs in the 3 to 100 liter range. Most of the hot testing required for design of the IPM must be accomplished in the next 3 years. This work plan defines the tasks associated with the development of a 0.5-l sampler system. This system will be referred to as the Half-Liter Supernatant Sampler System (HLSSS). Specifically, this work plan will define the scope of work, identify organizational responsibilities, identify major technical requirements, describe configuration control and verification requirements, and provide estimated costs and schedule. The sampler system will be fully operational, including trained staff and operating procedures, upon completion of this task.

23314 (WHC-SP–1156) **Mid-year report: IPC liaison and chemistry of thermal reconstitution.** Delegard, C.H. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013513. Source: OSTI; NTIS; INIS; GPO Dep.

A program of investigation into the chemistry of alkaline Hanford Site tank waste is being conducted. The investigations have two main subtasks: liaison with the Institute of Physical Chemistry of the Russian Academy of Sciences and further laboratory testing of the chemistry of thermal reconstitution of Hanford Site tank waste. Progress to date includes: (1) a technical dialogue has been established with the Institute scientists; (2) editing of a technical literature review on the chemistry of the transuranic elements and technetium in alkaline media written by researchers at the Institute is complete; (3) four tasks from the Institute have been selected for support by the US Department of Energy; (4) technical information has been supplied to the Institute describing the composition of Hanford Site tank waste; (5) tests, using genuine waste from tank 104-S (a REDOX Process sludge), comparing the performance of thermal reconstitution with enhanced sludge washing show markedly improved dissolution of aluminum achieved by the thermal treatment; (6) a reduction/coprecipitation method was tested and shown to remove plutonium, solubilized by thermal treatment, rapidly and efficiently from solution; (7) technical chemistry support was provided to calciner kinetics tests at the University of Idaho; (8) tests to determine the speciation of plutonium and neptunium solubilized by thermal treatment show dissolved Pu(V) and Np(V) hydroxide complexes are produced, a Np(V) peroxide complex also was identified; (9) recently published data on Pu(IV) carbonate complexation in moderately alkaline (pH 12 to 13) solution led to reexamination of previous investigations of plutonium complexation in highly alkaline (3 to 5 molar NaOH) solutions.

23315 (ANL/DIS/CP–85160) **Applying automated data acquisition and management technology to bioremediation.** Widing, M.A.; Leser, C. Argonne National Lab., IL (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9505101–2: Conference on challenges and innovations in the management of hazardous waste, Washington, DC (United States), 10-12 May 1995). Order Number DE95013370. Source: OSTI; NTIS; GPO Dep.

Operating a bioremediation process requires timely and accurate analysis of physical and chemical parameters that can affect the system. At a fuel oil spill site, the operation of an in-situ bioremediation system, consisting of fluid and nutrient injection, fluid withdrawal, and aeration cycles, is monitored by means of electronic downhole sensors and on-site chemical analysis. A data acquisition and management system was designed and implemented to rapidly analyze data for operational decision malting. A hardware suite, containing an electronic monitoring system data acquisition computer, and data analysis workstation, was also developed. Through the use of both commercial software products and custom software, suites of data management and analysis tools were provided. The data acquisition suite of software tools assisted in programming dataloggers, automatically recording monitored data, and integrating these data with manually sampled chemical data. The data analysis suite of software tools assisted in downloading data to remote workstations, sampling the database for trend analysis, and automating the interface to commercial analysis packages.

23316 (CONF-9504123–2) **Biological tracer for waste site characterization.** Strong-Gunderson, J. Oak Ridge National Lab.,

TN (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Innovative concepts technology and business opportunities; Denver, CO (United States); 20-21 Apr 1995. Order Number DE95014598. Source: OSTI; NTIS; INIS; GPO Dep.

Remediating hazardous waste sites requires detailed site characterization. In groundwater remediation, characterizing the flow paths and velocity is a major objective. Various tracers have been used for measuring groundwater velocity and transport of contaminants, colloidal particles, and bacteria and nutrients. The conventional techniques use dissolved solutes, dyes. and gases to estimate subsurface transport pathways. These tracers can provide information on transport and diffusion into the matrix, but their estimates for groundwater flow through fractured regions are very conservative. Also, they do not have the same transport characteristics as bacteria and suspended colloid tracers, both of which must be characterized for effective in-place remediation. Bioremediation requires understanding bacterial transport and nutrient distribution throughout the acquifer, knowledge of contaminants s mobile colloidal particles is just essential.

23317 (DOE/AL/62350–171) **UMTRA Project-Level Cost Reduction/Productivity Improvement Program manual.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Jun 1995. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95016204. Source: OSTI; NTIS; INIS; GPO Dep.

Mission of the Uranium Mill Tailings Remedial Action (UMTRA) Project Cost Reduction/Productivity Improvement Program (CR/PIP) is to contribute to the UMTRA Project's environmental restoration mission by providing the means to achieve and recognize continuous improvements and cost savings. This manual includes program definition, description of UMTRA project organizational responsibilities and interfaces with existing project functions, guidance to contractors, and definition of project-level functions.

23318 (DOE/AL/62350–191) **Report of ground water monitoring for expansion of the golf course, Salt Lake City, Utah, vitro processing site.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Jun 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95013501. Source: OSTI; NTIS; INIS; GPO Dep.

To determine the potential impacts of the proposed golf course expansion on the south side of the Vitro site, ground water data from the UMTRA Vitro processing site were evaluated in response to the U.S. Department of Energy (DOE) Uranium Mill Tailings Remedial Action (UMTRA) Project Office request. Golf in the Round, Inc., has proposed an expansion of the present driving range to include a 9-hole golf course on the UMTRA Vitro processing site, which is owned by the Central Valley Water Reclamation Facility (CVWRF). An expanded golf course would increase irrigation and increase the amount of water that could infiltrate the soil, recharging the unconfined aquifer. Increased water levels in the aquifer could alter the ground water flow regime; contaminants in the shallow ground water could then migrate off the site or discharge to surface water in the area. Dewatering of the unconfined aquifer on CVWRF property could also impact site contaminant migration; a significant amount of ground water extraction at CVWRF could reduce the amount of contaminant migration off the site. Since 1978, data have been collected at the site to determine the distribution of tailings materials (removed from the site from 1985 to 1987) and to characterize the presence and migration of contaminants in sediments, soils, surface water, and ground water at the former Vitro processing site. Available data suggest that irrigating an expanded golf course may cause contamination to spread more rapidly within the unconfined aquifer. The public is not at risk from current Vitro processing site activities, nor is risk expected due to golf course expansion. However, ecological risk could increase with increased surface water contamination and the development of ground water seeps.

23319 (DOE/CAO–2056-Vol.6-Draft) **Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 6: Appendix GCR Volume 1.** USDOE Carlsbad Area Office, NM (United States); Sandia Labs., Albuquerque, NM (United States). 31 Mar 1995. 556p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. (SAND–78-1596-Vol.1). Order Number DE95012435. Source: OSTI; NTIS; INIS; GPO Dep.

The Geological Characterization Report (GCR) for the WIPP site presents, in one document, a compilation of geologic information available to August, 1978, which is judged to be relevant to studies for the WIPP. The Geological Characterization Report for the WIPP site is neither a preliminary safety analysis report nor an environmental impact statement; these documents, when prepared, should be consulted for appropriate discussion of safety analysis and environmental impact. The Geological Characterization Report of the WIPP site is a unique document and at this time is not required by regulatory process. An overview is presented of the purpose of the WIPP, the purpose of the Geological Characterization Report, the site selection criteria, the events leading to studies in New Mexico, status of studies, and the techniques employed during geological characterization.

23320 (DOE/CAO–2056-Vol.7-Draft) **Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 7: Appendix GCR Volume 2.** USDOE Carlsbad Area Office, NM (United States); Sandia Labs., Albuquerque, NM (United States). 31 Mar 1995. 725p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. (SAND–78-1596-Vol.2). Order Number DE95012752. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains the second part of the geological characterization report for the Waste Isolation Pilot Plant. Both hydrology and geochemistry are evaluated. The following aspects of hydrology are discussed: surface hydrology; ground water hydrology; and hydrology drilling and testing. Hydrologic studies at the site and adjacent site areas have concentrated on defining the hydrogeology and associated salt dissolution phenomena. The geochemical aspects include a description of chemical properties of geologic media presently found in the surface and subsurface environments of southeastern New Mexico in general, and of the proposed WIPP withdrawal area in particular. The characterization does not consider any aspect of artificially-introduced material, temperature, pressure, or any other physico-chemical condition not native to the rocks of southeastern New Mexico.

23321 (DOE/CAO–2056-Vol.8-Draft) **Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 8: Appendices HYDRO, IRD, LTM, NUTS, PAR, PMR, QAPD, RBP.** USDOE Carlsbad Area Office, NM (United States); Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. 31 Mar 1995. 619p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE95012753. Source: OSTI; NTIS; INIS; GPO Dep.

Geohydrologic data have been collected in the Los Medanos area at the US Department of Energy's proposed Waste Isolation Pilot Plant (WIPP) site in southeastern New Mexico since 1975 as part of a study evaluating the feasibility of storing defense-associated nuclear wastes within the bedded salt of the Salado Formation of Permian age. Drilling and hydrologic testing have identified three principal water-bearing zones above the Salado Formation and one below that could potentially transport wastes to the biosphere if the proposed facility were breached. The zones above the Salado are the contact between the Rustler and Salado Formations and the Culebra and Magenta Dolomite Members of the Rustler Formation of Permian age. The zone below the Salado Formation consists of channel sandstones in the Bell Canyon Formation of the Permian Delaware Mountain Group. Determinations of hydraulic gradients, directions of flow, and hydraulic properties were hindered because of the negligible permeability of the water-bearing zones. Special techniques in drilling, well completion, and hydraulic testing have been developed to determine the hydrologic characteristics of these water-producing zones.

23322 (DOE/CAO–2056-Vol.9-Draft) **Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 9: Appendices RM, SCR, SER, SUM, WRAC.** USDOE Carlsbad Area Office, NM (United States); Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div.

31 Mar 1995. 580p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. Order Number DE95012755. Source: OSTI; NTIS; INIS; GPO Dep.

The Rock Mechanics Program is important to the establishment of a radioactive waste repository in salt because rock mechanics deals with the prediction of creep closure and eventual encapsulation of the waste. The intent of this paper is to give the current status of the program. This program consists of three major modeling efforts: continuum creep, fracture, and the disturbed rock zone. These models, together with laboratory material parameters, plastic flow potentials, initial and boundary input data, and other peripheral information forms the predictive technology. The extent to which the predictive technology is validated against in situ test data adds certainty to the method. Application of the technology is through simulations of the test results, design, or performance using numerical codes. In summary, the predictive capabilities are technically sound and reasonable. The current status of the program is that which would be advanced for compliance.

23323 (DOE/EA–1030) **Characterization of stored defense production spent nuicear fuel and associated materials at Hanford Site, Richland Washington: Environmental assessment.** USDOE, Washington, DC (United States). Mar 1995. 62p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012247. Source: OSTI; NTIS; INIS; GPO Dep.

There are about 2,100 tonnes (2,300 tons) of defense production spent nuclear fuel stored in the 100-K Area Basins located along the south shore of the Columbia River in the northern part of the Hanford Site. Some of the fuel which has been in storage for a number of years is in poor condition and continues to deteriorate. The basins also contain fuel fragments and radioactively contaminated sludge. The DOE needs to characterize defense production spent nuclear fuel and associated materials stored on the Hanford Site. In order to satisfy that need, the Department of Energy (DOE) proposes to select, collect and transport samples of spent nuclear fuel and associated materials to the 327 Building for characterization. As a result of that characterization, modes of interim storage can be determined that would be compatible with the material in its present state and alternative treatment processes could be developed to permit a broader selection of storage modes. Environmental impacts of the proposed action were determined to be limited principally to radiation exposure of workers, which, however, were found to be small. No health effects among workers or the general public would be expected under routine operations. Implementation of the proposed action would not result in any impacts on cultural resources, threatened, endangered and candidate species, air or water quality, socioeconomic conditions, or waste management.

23324 (DOE/EIS–0203-F-Vol.1-App.L) **Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs. Final Environmental Impact Statement: Volume 1, Appendix L, Environmental Justice.** USDOE Idaho Operations Office, Idaho Falls, ID (United States). Apr 1995. 46p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012042. Source: OSTI; NTIS; INIS; GPO Dep.

Appendix L provides an assessment of the areas surrounding the 10 sites under consideration for the management of spent nuclear fuels (SNF) under all programmatic alternatives considered in this volume. It is divided into two sections: (a) the five sites considered for the management of DOE naval SNF only (under the No Action and Decentralization alternatives, and (b) the five DOE sites being considered for the management of all types of DOE SNF under all alternatives. The five sites considered for the management of naval SNF only are the Norfolk Naval Shipyard, Portsmouth, Virginia; Portsmouth Naval Shipyard, Kittery, Maine; Pearl Harbor Naval Shipyard, Honolulu, Hawaii; Puget Sound Naval Shipyard, Bremerton, Washington; and Kesselring Site, West Milton, New York. The five DOE sites considered for the management of some portion or all DOE SNF are the Savannah River Site, Aiken, South Carolina; Oak Ridge Reservation, Oak Ridge, Tennessee; Idaho National Engineering Laboratory, Idaho Falls, Idaho; Hanford Site, Richland, Washington; and Nevada Test Site, Mercury, Nevada. This assessment includes potential adverse impacts resulting from both onsite activities and associated transportation of materials. Based on this assessment, it is concluded that none of the alternatives analyzed results in disproportionately high and adverse effects on minority populations or low-income communities surrounding any of the sites under consideration for the management of SNF or associated offsite transportation routes.

23325 (DOE/EIS–0226) **Implementation plan for the Environmental Impact Statement for completion of the West Valley Demonstration Project by the US Department of Energy and closure of the western New York Nuclear Service Center, The New York State Energy Research and Development Authority. Revision 7.** USDOE, Washington, DC (United States); New York State Energy Research and Development Authority, Albany, NY (United States); USDOE West Valley Area Office, NY (United States). Mar 1995. 108p. Sponsored by USDOE, Washington, DC (United States);New York State Government, Albany, NY (United States);Nuclear Regulatory Commission, Washington, DC (United States). Order Number DE95012245. Source: OSTI; NTIS; INIS; GPO Dep.

The primary purpose of the EIS Implementation Plan (IP) is to record the results of the scoping process and to provide guidance to the DOE for the preparation of an EIS (10 CFR 1021). In order to provide such guidance, this IP identifies the purpose and need for agency action (Section 2.0); summarizes the results of the scoping process (Section 3.0); identifies and describes cleanup and closure alternatives (Section 4.0); identifies significant environmental issues (Section 5.0); discusses the environmental impact statement preparation issues (Section 6.0); and presents a detailed outline of the draft EIS in Appendix E. The IP also identifies certain issues that are not within the scope of the EIS.

23326 (DOE/RW/00134–T18) **Nevada potential repository preliminary transportation strategy: Study 1.** TRW Environmental Safety Systems, Inc., Las Vegas, NV (United States). Apr 1995. 169p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC01-91RW00134. Order Number DE95013302. Source: OSTI; NTIS; INIS; GPO Dep.

Limited feasible options exist when considering the shipment of spent nuclear fuel and high-level radioactive waste. These options are rail or truck; because of the weight associated with transportation casks (68.0 to 113.4 tonnes/75 to 125 tons), heavy-haul trucks are also considered. Yucca Mountain currently lacks rail service or an existing right-of-way for rail; it also lacks a dedicated highway suitable for heavy-haul trucks. Approximately 11,230 shipments by rail are planned from waste producer sites to Nevada, with an additional 1,041 shipments by legal-weight truck from four reactor sites not capable of upgrading for rail shipment. This study identifies the reasonable alternatives for waste transport to the potential repository site, describes the evaluation process performed to identify those alternatives, and discusses the reasons for elimination of transportation routes deemed to be not reasonable. The study concluded that heavy haul truck transportation is feasible-cost is very favorable when compared to rail-but route restrictions must be further evaluated. In addition to restrictions due to seasonal weather conditions, specific routes have additional restrictions, including no travel on holidays or weekends, and travel during daylight hours only. Further restrictions will be imposed by the U.S. Department of Transportation based on routing of radioactive materials by highway. Operation and maintenance costs for heavy-haul over a 24-year period, based on preliminary information, were calculated on an estimated operational cost of $15,000 per trip, with an estimated 468 trips per year average (11,230 total trips), for an estimated cost of $171 million to $173 million, depending on the route used. Because the initial costs and the total system life cycle costs of heavy-haul are approximately 50 percent lower than the lowest rail cost, this option will continue to be evaluated.

23327 (DOE/RW–95014715) **Site environmental report for calendar year 1994, Yucca Mountain Site, Nye County, Nevada.** USDOE Yucca Mountain Site Characterization Project Office, Las Vegas, NV (United States). Jun 1995. 117p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014715. Source: OSTI; NTIS; INIS; GPO Dep.

The Yucca Mountain Site Characterization office has established an environmental program to ensure that facilities are operated in

order to protect, maintain, and restore environmental quality, minimize potential threats to the environment and the public, and comply with environmental policies and US DOE orders. The status of the environmental program has been summarized in this annual report to characterize performance, confirm compliance with environmental requirements, and highlight significant programs and efforts during CY 1994. Monitoring, archaeology, groundwater, ecosystems, tortoise conservation, waste minimization, etc., are covered.

23328 (LA–12967-MS) **Ecological surveys of the proposed high explosives wastewater treatment facility region.** Haarmann, T. Los Alamos National Lab., NM (United States). Jul 1995. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95015053. Source: OSTI; NTIS; INIS; GPO Dep.

Los Alamos National Laboratory (LANL) proposes to improve its treatment of wastewater from high explosives (HE) research and development activities. The proposed project would focus on a concerted waste minimization effort to greatly reduce the amount of wastewater needing treatment. The result would be a 99% decrease in the HE wastewater volume, from the current level of 6,760,000 L/mo (1,786,000 gal./mo) to 41,200 L/mo (11,000 gal./mo). This reduction would entail closure of HE wastewater outfalls, affecting some wetland areas that depend on HE wastewater effluents. The outfalls also provide drinking water for many wildlife species. Terminating the flow of effluents at outfalls would represent an improvement in water quality in the LANL region but locally could have a negative effect on some wetlands and wildlife species. None of the affected species are protected by any state or federal endangered species laws. The purpose of this report is to briefly discuss the different biological studies that have been done in the region of the project area. This report is written to give biological information and baseline data and the biota of the project area.

23329 (LA-SUB–95-72) **The modification and application of RAMS computer code. Final report.** McKee, T.B. (Colorado State Univ., Fort Collins, CO (United States). Dept. of Atmospheric Science). Los Alamos National Lab., NM (United States); Colorado State Univ., Fort Collins, CO (United States). Dept. of Atmospheric Science. 17 Jan 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95014570. Source: OSTI; NTIS; INIS; GPO Dep.

The Regional Atmospheric Modeling System (RAMS) has been utilized in its most updated form, version 3a, to simulate a case night from the Atmospheric Studies in COmplex Terrain (ASCOT) experimental program. ASCOT held a wintertime observational campaign during February, 1991 to observe the often strong drainage flows which form on the Great Plains and in the canyons embedded within the slope from the Continental Divide to the Great Plains. A high resolution (500 m grid spacing) simulation of the 4-5 February 1991 case night using the more advanced turbulence closure now available in RAMS 3a allowed greater analysis of the physical processes governing the drainage flows. It is found that shear interaction above and within the drainage flow are important, and are overpredicted with the new scheme at small grid spacing (< ~1000 m). The implication is that contaminants trapped in nighttime stable flows such as these, will be mixed too strongly in the vertical reducing predicted ground concentrations. The HYPACT code has been added to the capability at LANL, although due to the reduced scope of work, no simulations with HYPACT were performed.

23330 (LA-UR–95-1342) **LRAD surface monitoring results at TA-21.** Bounds, J.A. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95014014. Source: OSTI; NTIS; INIS; GPO Dep.

In August/September 1994, NIS-6 personnel used LRAD soil surface monitor technology to characterize the extent of alpha contamination on the surface of a parking lot adjacent to TA-21, LANL, known as Material Disposal Area B. This report documents that monitoring. Based on this survey, there is no reason for concern about significant contamination in the parking area as a whole, although unexpected small hot spots could exist between the grid points where monitoring was performed. However, the grouping of high readings on the east side of the parking area does point to possible contamination at the level of 100 dpm/100 cm^2 or less (above background). Further monitoring or remediation of this area seems appropriate. In addition, because this was an alpha survey, one cannot rule out contamination under the asphalt or possibly between layers if it was paved more than once.

23331 (PNL-SA–26209) **The development and usage of a new chemical transport code: AREST-CT.** Engel, D.W.; Chen, Yueting; Fort, J.A.; McGrail, B.P.; Steefel, C.I. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9504179–2: 6. annual international conference on high level radioactive waste management, Las Vegas, NV (United States), 30 Apr - 5 may 1995). Order Number DE95014620. Source: OSTI; NTIS; INIS; GPO Dep.

We are developing a computer code for DOE, called the Analyzer for REpository Source Term with Chemical Transport (AREST-CT), as a waste package computer model to analyze the performance of the potential site for the repository at Yucca Mountain, Nevada. This report briefly describes the AREST-CT development and an example showing the use of the coupled chemical-transport model.

23332 (SAND–94-2585) **Creep in Topopah Spring Member welded tuff. Yucca Mountain Site Characterization Project.** Martin, R.J. III (New England Research, Inc., White River Junction, VT (United States)); Boyd, P.J.; Noel, J.S.; Price, R.H. Sandia National Labs., Albuquerque, NM (United States). Jun 1995. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95014138. Source: OSTI; NTIS; INIS; GPO Dep.

A laboratory investigation has been carried out to determine the effects of elevated temperature and stress on the creep deformation of welded tuffs recovered from Busted Butte in the vicinity of Yucca Mountain, Nevada. Water saturated specimens of tuff from thermal/mechanical unit TSw2 were tested in creep at a confining pressure of 5.0 MPa, a pore pressure of 4.5 MPa, and temperatures of 25 and 250 C. At each stress level the load was held constant for a minimum of 2.5×10^5 seconds and for as long as 1.8×10^6 seconds. One specimen was tested at a single stress of 80 MPa and a temperature of 250 C. The sample failed after a short time. Subsequent experiments were initiated with an initial differential stress of 50 or 60 MPa; the stress was then increased in 10 MPa increments until failure. The data showed that creep deformation occurred in the form of time-dependent axial and radial strains, particularly beyond 90% of the unconfined, quasi-static fracture strength. There was little dilatancy associated with the deformation of the welded tuff at stresses below 90% of the fracture strength. Insufficient data have been collected in this preliminary study to determine the relationship between temperature, stress, creep deformation to failure, and total failure time at a fixed creep stress.

23333 (WHC-EP–0857) **Statement of work for analytical services provided to Westinghouse Hanford Company by the Pacific Northwest Laboratory Analytical Chemistry Laboratory.** Perry, J.K. Westinghouse Hanford Co., Richland, WA (United States). Apr 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012822. Source: OSTI; NTIS; INIS; GPO Dep.

This statement of work establishes the laboratory analytical criteria and requirements for the fiscal year 1995 radioactive airborne emissions measurement program for the Hanford Site.

23334 (WHC-SD-EN-AP–185) **Groundwater monitoring plan for the 300 Area process trenches.** Lindberg, J.W.; Chou, C.J.; Johnson, V.G. Westinghouse Hanford Co., Richland, WA (United States). 23 May 1995. 162p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013880. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes the groundwater monitoring program for the Hanford Site 300 Area Process Trenches (300 APT). The 300 APT are a Resource Conservation and Recovery Act of 1976 (RCRA) regulated unit. The 300 APT are included in the Dangerous Waste Portion of the Resource Conservation and Recovery Act Permit for the Treatment, Storage, and Disposal of Dangerous Waste, Permit No. WA890008967, and are subject to final-status

requirements for groundwater monitoring. This document describes a compliance monitoring program for groundwater in the uppermost aquifer system at the 300 APT. This plan describes the 300 APT monitoring network, constituent list, sampling schedule, statistical methods, and sampling and analysis protocols that will be employed for the 300 APT. This plan will be used to meet groundwater monitoring requirements from the time the 300 APT becomes part of the Permit and through the postclosure care period until certification of final closure.

23335 (WSRC-TR–94-0543-Rev.1) **Quarterly sampling of the wetlands along the old F-Area effluent ditch: August 1994. Revision 1.** Cummins, C.L.; Dixon, K.L. Westinghouse Savannah River Co., Aiken, SC (United States). Aug 1994. 78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95015191. Source: OSTI; NTIS; INIS; GPO Dep.

In August 1994, well point water and near-surface water samples were collected to further characterize tritium and volatile organic compounds in the Wetlands along the old F-Area effluent ditch south of 643-E at the Savannah River Plant. Well point samples were collected from seven locations and near-surface water samples were collected at four locations. Results of the August 1994 sampling event further support findings that tritium and volatile organic compounds are outcropping in the Wetlands near the old F-area effluent ditch. Four analytes (1,2-dichloroethylene, trichloroethylene, tritium, and vinyl chloride) were detected at least once at concentrations above the primary Drinking Water Standards or the Maximum Contaminant Levels. Five analytes (the above chemicals plus tetrachloroethylene) were detected at least once in the near-surface water samples at concentrations greater than the method detection limit.

23336 (ANL/DIS/CP–84269) **Development and use of consolidated criteria for evaluation of emergency preparedness plans for DOE facilities.** Lerner, K.; Kier, P.H.; Baldwin, T.E. Argonne National Lab., IL (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950430–9: 5. ANS topical meeting on emergency preparedness and response, Savannah, GA (United States), 18-21 Apr 1995). Order Number DE95013684. Source: OSTI; NTIS; INIS; GPO Dep.

Emergency preparedness at US Department of Energy (DOE) facilities is promoted by development and quality control of response plans. To promote quality control efforts, DOE has developed a review document that consolidates requirements and guidance pertaining to emergency response planning from various DOE and regulatory sources. The Criteria for Evaluation of Operational Emergency Plans (herein referred to as the Criteria document) has been constructed and arranged to maximize ease of use in reviewing DOE response plans. Although developed as a review instrument, the document also serves as a de facto guide for plan development, and could potentially be useful outside the scope of its original intended DOE clientele. As regulatory and DOE requirements are revised and added in the future, the document will be updated to stay current.

23337 (ANL/ES/CP–85247) **Ultrasonic process for remediation of organics-contaminated groundwater/wastewater.** Wu, J.M.; Peters, R.W. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9505217–3: Air & Waste Management Association Policy meeting, Washington, DC (United States), 10-12 May 1995). Order Number DE95013690. Source: OSTI; NTIS; INIS; GPO Dep.

A technology is being developed that employs ultrasonic-wave energy for remediation of groundwater/wastewater contaminated with volatile organic compounds such as carbon tetrachloride (CCl_4) and trichloroethylene (TCE). This paper presents the updated results of a laboratory investigation of ultrasonic groundwater remediation using synthetic groundwaters prepared with laboratory deionized water. Key process parameters investigated included steady-state temperature, contaminant concentration, solution pH, sonication time, and intensity of the applied ultrasonics-wave energy. High destruction efficiencies of the target contaminants were achieved, and the sonication time required for a given degree of destruction decreased with increasing intensity of the applied ultrasonic energy. The sonication time can be further reduced by adding a chemical oxidant such as hydrogen peroxide.

23338 (ANL/ES/CP–86536) **Plutonium mobility studies in soil sediment decontaminated by means of a soil-washing technology.** Negri, M.C. (Argonne National Lab., IL (United States)); Orlandini, K.A.; Swift, N.; Carfagno, D. Argonne National Lab., IL (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9505101–7: Conference on challenges and innovations in the management of hazardous waste, Washington, DC (United States), 10-12 May 1995). Order Number DE95013719. Source: OSTI; NTIS; INIS; GPO Dep.

The ACT*DE*CON^{SM} process extracts plutonium from contaminated soils/sediments by means of a series of washings with a blend of chemicals, that includes a chelating agent, an oxidant, and carbonates. At the end of the process, the Pu level in the soil is lowered to 25-30 pCi/g from an initial contamination level averaging 500 pCi/g. The radionuclide still present in the soil at the end of the treatment must be strongly immobilized in or onto the soil particles to minimize the risk of its percolation to the aquifer and/or uptake by vegetation. This paper reports the investigation of residual Pu mobility as K_d (distribution coefficient) in the treated soil/sediment. Six batches of contaminated soil were treated simultaneously by means of the ACT*DE*CON^{SM} process. Some batches of the treated soil were amended with a standard fertilizer treatment of compost and nutrient and brought to pH 8.5. The treated soil, treated and fertilized soil, and the untreated controls were then incubated at 18°C for 90 days. At four different times, a small aliquot of soil was retrieved from each of the batches and contacted with rainwater for six days to determine the Pu solid/liquid distribution and K_d. Results indicated that a higher total amount of Pu was leached from the untreated soil, probably as a consequence of the higher content of available/exchangeable Pu in this soil compared with the treated ones. Treated/fertilized soils showed Pu leaching at intermediate levels between those for treated and untreated soils, at least for the first 30 days of incubation. K_d values at the beginning of the incubation period were significantly lower in the untreated and treated/fertilized soils compared with those for the treated-only, but at 90 days, these values were substantially equal among the three different soils. Traces of the chelant were detectable only in treated, unfertilized soil.

23339 (ANL/RE/CP–85754) **Seismic evaluation of a hot cell structure.** Srinivasan, M.G.; Kot, C.A. Argonne National Lab., IL (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950740–60: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95014239. Source: OSTI; NTIS; INIS; GPO Dep.

The evaluation of the structural capacity of and the seismic demand on an existing hot cell structure in a nuclear facility is described. An ANSYS finite-element model of the cell was constructed, treating the walls as plates and the floor and ceiling as a system of discrete beams. A modal analysis showed that the fundamental frequencies of the cell walls lie far above the earthquake frequency range. An equivalent static analysis of the structure was performed. Based on the analysis it was demonstrated that the hot cell structure, would readily withstand the evaluation basis earthquake.

23340 (DOE/AL/62350–157-Rev.) **Site observational work plan for the UMTRA Project site at Falls City, Texas.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Jun 1995. 300p. Sponsored by USDOE, Washington, DC (United

States). DOE Contract AC04-91AL62350. Order Number DE95015575. Source: OSTI; NTIS; INIS; GPO Dep.

Produced by the US Department of Energy (DOE), this site observational work plan (SOWP) will be used to determine site-specific activities to comply with the US Environmental Protection Agency (EPA) ground water standards at this Uranium Mill Tailings Remedial Action (UMTRA) Project site. The purpose of the SOWP is to recommend a site-specific ground water compliance strategy at the Falls City UMTRA Project site. The Falls City SOWP presents a comprehensive summary of site hydrogeological data, delineates a conceptual model of the aquifer system, and discusses the origins of milling-related ground water contamination. It also defines the magnitude of ground water contamination, potential environmental and health risks associated with ground water contamination and data gaps, and targets a proposed compliance strategy.

23341 (DOE/AL/62350–179) **Baseline risk assessment of ground water contamination at the Uranium Mill Tailings Sites near Rifle, Colorado.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). May 1995. 252p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95013503. Source: OSTI; NTIS; INIS; GPO Dep.

The ground water project evaluates the nature and extent of ground water contamination resulting from the uranium ore processing activities. This report is a site specific document that will be used to evaluate current and future impacts to the public and the environment from exposure to contaminated ground water. Currently, no one is using the ground water and therefore, no one is at risk. However, the land will probably be developed in the future and so the possibility of people using the ground water does exist. This report examines the future possibility of health hazards resulting from the ingestion of contaminated drinking water, skin contact, fish ingestion, or contact with surface waters and sediments.

23342 (DOE/AL/62350–188) **Final audit report of remedial action construction at the UMTRA Project Falls City, Texas, site.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). May 1995. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95013502. Source: OSTI; NTIS; INIS; GPO Dep.

This final audit report for the Falls City, Texas, Uranium Mill Tailings Remedial Action Project site summarizes the radiological audits and the quality assurance (QA) in-process surveillances, audits, and final close-out inspection performed by the U.S. Department of Energy (DOE) and Technical Assistance Contractor (TAC). It also summarizes U.S. Nuclear Regulatory Commission (NRC) surveillances. One radiological audit and three radiological surveillances were performed at the Falls City site. These surveillances and audit, which resulted in 31 observations, focused primarily on processing site activities and were performed on the following dates: 3-6 August 1992, 29-30 October 1992, 22-26 March 1993, and 1-3 November 1993. All outstanding radiological issues were closed out at the completion of the construction activities. Six QA in-process surveillances, which resulted in 71 observations, were performed at the Falls City site on the following dates: 22-24 July 1992, 23-25 November 1992, 17-19 May 1993, 16-18 August 1993, 13-15 October 1993, and 2-4 February 1994. All outstanding issues were closed out with the February surveillance on 3 March 1994. The DOE/TAC remedial action close-out inspections of the Falls City site, which resulted in 56 observations, were conducted 9-10 June 1994 and 26 July 1994. The inspections were closed out on 26 January 1995. The NRC performed three on-site construction reviews (OSCR), resulting in seven observations of remedial action construction activities that occurred during site visits. The OSCRs were performed 9 December 1992, 12 May 1993, and 25 October 1993. Since all audit and surveillance observations and recommendations have been closed out, this final audit report segment of the site certification process is complete.

23343 (DOE/CAO–2056-Vol.5-Draft) **Draft Title 40 CFR 191 compliance certification application for the Waste Isolation Pilot Plant. Volume 5: Appendices D and D, DEF, FAC.** USDOE Carlsbad Area Office, NM (United States); Westinghouse Electric Corp., Carlsbad, NM (United States). Waste Isolation Div. 31 Mar 1995. 529p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-86AL31950. (DOE/WIPP–95-2072). Order Number DE95012434. Source: OSTI; NTIS; INIS; GPO Dep.

This plan serves to describe the objectives of decommissioning for the Waste Isolation Pilot Plant (WIPP), identifies the elements necessary to accomplish the decommissioning, and defines the steps to execute those elements in a safe and environmentally sound manner. The plan provides a strategy for progressing from the final actions of the Disposal Phase, through the Decontamination and Decommissioning Phase, and into the initiation of the Long-Term Monitoring Phase. This plan describes a sequence of events for decontamination of the WIPP facilities and structures used to manage and contain TRU and TRU mixed waste during the receipt and emplacement operations. Alternative methods of decontamination are provided where practical. The methods for packaging and disposal of the waste generated (derived waste) during this process are discussed. The best available technology at the time of this plan's development, may become outmoded by future technology and alternative strategies. If alternative technologies are identified the affected stakeholder(s), the Secretary of the Interior and the State will be consulted prior to implementation.

23344 (DOE/EA–0683) **Environmental assessment for Mound Plant decontamination and decommissioning projects, Mound Plant, Miamisburg, Ohio.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). May 1995. 54p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014000. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) has prepared an Environmental Assessment (EA) for seven decontamination and decommissioning (D&D) projects at the Mound Plant in Miamisburg, Ohio, that have not been previously addressed in the Final Environmental Impact Statement for the Mound Facility (June 1979). Based on the information presented in the EA, the DOE has determined that the proposed action is not a major Federal action significantly affecting the quality of the human environment within the meaning of the National Environmental Policy Act (NEPA) of 1969. Therefore, the preparation of an Environmental Impact Statement (EIS) is not required and the Department is issuing this Finding of No Significant Impact (FONSI).

23345 (DOE/EH–0497) **Department of Energy Voluntary Protection Program - Part IV: Onsite review handbook.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Jul 1995. 108p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95015935. Source: OSTI; NTIS; GPO Dep.

Onsite Review Handbook contains criteria to be used in evaluating the management systems required for initial or continued participation in the Department of Energy Voluntary Protection Program (DOE-VPP), verifying and calculating rates of injury experience, the Onsite Review report format, and sample questions to be used during onsite interviews. This document should be used in conjunction with the first three DOE-VPP manuals (Part I: Program Elements, Part II: Procedures Manual, and Part III: Application Guidelines). This document is intended to assist Onsite Review team members and DOE contractors in evaluating safety and health programs, and to serve as guidance for DOE-VPP participants in performing their required annual evaluation. Requests for additional information or any questions may be addressed to a DOE-VPP Coordinator in the Office of Occupational Safety and Health Policy. The term contractor used throughout this document refers to an applicant to, or a participant in, the DOE-VPP. The term subcontractor refers to any organization that is contracted by the applicant or participant to do work at the site under review. The DOE-VPP Onsite Review Criteria contained in Appendix A provide guidance for evaluating a site's implementation of the program requirements given in Part I: Program Elements. The program requirements are in bold italicized type, followed by guidance for ensuring implementation. Part I should be consulted for a complete description of the program requirements. These criteria should be used by team members whenever possible, but are not intended to be all inclusive. Determination of adequate implementation of the

DOE-VPP requirements is at the team members' discretion. Guidance for calculating recordable injury and lost workday incidence rates is contained in Appendix B. The OSHA injury/illness records review and the associated calculations should be performed by On-site Review Team members during the pre-onsite planning visit.

23346 (DOE/EM–0250) **Robotics Technology Crosscutting Program. Technology summary.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Jun 1995. 114p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95016130. Source: OSTI; NTIS; INIS; GPO Dep.

The Robotics Technology Development Program (RTDP) is a needs-driven effort. A length series of presentations and discussions at DOE sites considered critical to DOE's Environmental Restoration and Waste Management (EM) Programs resulted in a clear understanding of needed robotics applications toward resolving definitive problems at the sites. A detailed analysis of the resulting robotics needs assessment revealed several common threads running through the sites: Tank Waste Retrieval (TWR), Contaminant Analysis Automation (CAA), Mixed Waste Operations (MWO), and Decontamination and Dismantlement (D and D). The RTDP Group also realized that some of the technology development in these four areas had common (Cross Cutting-CC) needs, for example, computer control and sensor interface protocols. Further, the OTD approach to the Research, Development, Demonstration, Testing, and Evaluation (RDDT and E) process urged an additional organizational breakdown between short-term (1–3 years) and long-term (3–5 years) efforts (Advanced Technology-AT). These factors lead to the formation of the fifth application area for Crosscutting and Advanced Technology (CC and AT) development. The RTDP is thus organized around these application areas – TWR, CAA, MWO, D and D, and CC and AT – with the first four developing short-term applied robotics. An RTDP Five-Year Plan was developed for organizing the Program to meet the needs in these application areas.

23347 (DOE/EM–0252) **Mixed waste characterization, treatment, and disposal focus area. Technology summary.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Office of Technology Development. Jun 1995. 116p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95016003. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents details about the technology development programs of the Department of Energy. In this document, waste characterization, thermal treatment processes, non-thermal treatment processes, effluent monitors and controls, development of on-site innovative technologies, and DOE business opportunities are applied to environmental restoration. The focus areas for research are: contaminant plume containment and remediation; mixed waste characterization, treatment, and disposal; high-level waste tank remediation; landfill stabilization; and decontamination and decommissioning.

23348 (DOE/EM–0253) **Decontamination and decommissioning focus area. Technology summary.** USDOE Office of Environmental Restoration and Waste Management, Washington, DC (United States). Office of Technology Development. Jun 1995. 77p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95016002. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents details of the facility deactivation, decommissioning, and material disposition research for development of new technologies sponsored by the Department of Energy. Topics discussed include; occupational safety, radiation protection, decontamination, remote operated equipment, mixed waste processing, recycling contaminated metals, and business opportunities.

23349 (DOE/EM–0255) **Radioactive Tank Waste Remediation Focus Area. Technology summary.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Jun 1995. 111p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95016251. Source: OSTI; NTIS; INIS; GPO Dep.

In February 1991, DOE's Office of Technology Development created the Underground Storage Tank Integrated Demonstration (UST-ID), to develop technologies for tank remediation. Tank remediation across the DOE Complex has been driven by Federal Facility Compliance Agreements with individual sites. In 1994, the DOE Office of Environmental Management created the High Level Waste Tank Remediation Focus Area (TFA; of which UST-ID is now a part) to better integrate and coordinate tank waste remediation technology development efforts. The mission of both organizations is the same: to focus the development, testing, and evaluation of remediation technologies within a system architecture to characterize, retrieve, treat, concentrate, and dispose of radioactive waste stored in USTs at DOE facilities. The ultimate goal is to provide safe and cost-effective solutions that are acceptable to both the public and regulators. The TFA has focused on four DOE locations: the Hanford Site in Richland, Washington, the Idaho National Engineering Laboratory (INEL) near Idaho Falls, Idaho, the Oak Ridge Reservation in Oak Ridge, Tennessee, and the Savannah River Site (SRS) in Aiken, South Carolina.

23350 (DOE/EM–0257) **Environmental Restoration Strategic Plan. Remediating the nuclear weapons complex.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Aug 1995. 19p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95016164. Source: OSTI; NTIS; INIS; GPO Dep.

With the end of the cold war, the US has a reduced need for nuclear weapons production. In response, the Department of Energy has redirected resources from weapons production to weapons dismantlement and environmental remediation. To this end, in November 1989, the US Department of Energy (DOE) established the Office of Environmental Restoration and Waste Management (renamed the Office of Environmental Management in 1994). It was created to bring under a central authority the management of radioactive and hazardous wastes at DOE sites and inactive or shut down facilities. The Environmental Restoration Program, a major component of DOE's Environmental Management Program, is responsible for the remediation and management of contaminated environmental media (e.g., soil, groundwater, sediments) and the decommissioning of facilities and structures at 130 sites in over 30 states and territories.

23351 (DOE/MC/29467–4080) **Decontamination systems information and research program. Quarterly report, January–March 1995.** National Research Center for Coal and Energy, Morgantown, WV (United States). Apr 1995. 360p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-92MC29467. Order Number DE95009726. Source: OSTI; NTIS; GPO Dep.

The projects reported during this period are categorized into the following three areas: 1.0 Site Remediation Technologies, 2.0 Advanced Product Applications Testing, and 3.0 Information Systems, Public Policy, Community Outreach, and Economics. Summaries of the significant accomplishments for the projects reported during this period, are presented.

23352 (DOE/OR/21548–436-Rev.) **Weldon Spring Site Environmental Report for calendar year 1994.** MK-Ferguson Co., St. Charles, MO (United States); Jacobs Engineering Group, Inc., St. Charles, MO (United States). May 1995. 330p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-86OR21548. Order Number DE95015486. Source: OSTI; NTIS; INIS; GPO Dep.

This report for Calendar Year 1994 has been prepared to provide information about the public safety and environmental protection programs conducted by the Weldon Spring Site Remedial Action Project (WSSRAP). The Weldon Spring site is located in southern St. Charles County, Missouri, approximately 48 km (30 mi) west of St. Louis. The site consists of two main areas, the Weldon Spring Chemical Plant and raffinate pits and the Weldon Spring Quarry. The chemical plant, raffinate pits, and quarry are located on Missouri State Route 94, southwest of US Route 40/61. The objectives of the Site Environmental Report are to present a summary of data from the environmental monitoring program, to characterize trends and environmental conditions at the site, and to confirm compliance with environmental and health protection standards and requirements. The report also presents the status of remedial activities and the results of monitoring these activities to assess their

impacts on the public and environment. This report includes monitoring data from routine radiological and nonradiological sampling activities. These data include estimates of dose to the public from the Weldon Spring site, estimates of effluent releases, and trends in groundwater contaminant levels. Additionally, applicable compliance requirements, quality assurance programs, and special studies conducted in 1994 to support environmental protection programs are discussed. Dose estimates presented in this report are based on hypothetical exposure scenarios of public use of areas near the site. In addition, release estimates have been calculated on the basis of 1994 National Pollutant Discharge Elimination System (NPDES) and air monitoring data. Effluent discharges from the site under routine NPDES and National Emission Standards for Hazardous Air Pollutants (NESHAPS) monitoring were below permitted levels.

23353 (DOE/RL–94-61-Vol.1) **100 Area source operable unit focused feasibility study. Volume 1.** USDOE Richland Operations Office, WA (United States). Jun 1995. 896p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95014150. Source: OSTI; NTIS; INIS; GPO Dep.

The 100 Area is one of four Hanford areas placed on the National Priority List of waste sites in 1989 under CERCLA authority. Purpose of this focused feasibility study (FFS) is to provide decision makers sufficient information to select interim remedial alternatives for IRM (interim remedial measures) candidate waste sites within the 100 Areas. Scope covers high-priority source waste sites (sites at which there was direct disposal of wastes or a direct release of hazardous substances). This FFS contains three major components; the first major component, Sections 1.0-7.0 and Appendices A, B, and C, is the Process Document, which describes the Remedial Alternatives developed for remediation of the 100 Area source waste sites, evaluates these alternatives against CERCLA and other environmental criteria, and compares the alternatives against each other. The Process Document addresses 10 logical groupings of individual waste sites. It evaluates remedial alternatives for each waste site group assuming their groundwater should be protected as a potential drinking water source and the remediated areas will be used for recreational or other occasional use. A second major component of this report, the Sensitivity Analysis (Appendix D), evaluates how the analysis might change for different exposure scenarios. The third major component comprises the operableunit specific FFSs prepared for the 100-HR-1, 100-BC-1, and 100-DR-1 Operable Units (Appendices E, F, and G).

23354 (DOE/RL–95-70) **Hanford Sampling Quality Management Plan (HSQMP).** Hyatt, J.E. Westinghouse Hanford Co., Richland, WA (United States). Jun 1995. 84p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95016482. Source: OSTI; NTIS; INIS; GPO Dep.

HSQMP establishes quality requirements in response to DOE Order 5700. 6C and to 10 Code of Federal Regulations 830.120. HSQMP is designed to meet the needs of Richland Operations Office for controlling the quality of services provided by sampling operations. It is issued through the Analytical Services Program of the Waste Programs Division. This document describes the Environmental Sampling and Analysis Program activities considered to represent the best management activities necessary to achieve a sampling program with adequate control.

23355 (DOE/SR/18217–4) **Cancer and birth defects surveillance system for communities around the Savannah River Site. Phase 1, Technical progress report: Cancer.** Dunbar, J.B. Medical Univ. of South Carolina, Charleston, SC (United States). Dept. of Biometry and Epidemiology. May 1995. 75p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-91SR18217. Order Number DE95012426. Source: OSTI; NTIS; INIS; GPO Dep.

Year 04 began the second three-year grant period, the overall goals of which were to consolidate and continue the aims of the first period, with the important exception that a great deal more effort would be expended on promoting community awareness and knowledge, as these characteristics relate to the residents' perceptions of major potential health effects. It was anticipated that more time would be available during the second period to accomplish this aim because the difficult early work of gaining hospital and community acceptance would have been done. Specifically, the goals were to: Maintain and refine the cancer registry; Inaugurate the birth defects registry if it were funded; and Enhance community involvement and education.

23356 (ES/ER/TM–106) **Preliminary remediation goals for use at the U.S. Department of Energy Oak Ridge Operations Office.** Oak Ridge National Lab., TN (United States). Jun 1995. 610p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95013998. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents Preliminary Remediation Goals (PRGs) for use in human health risk assessment efforts under the United States Department of Energy, Oak Ridge Operations Office Environmental Restoration (ER) Division. Chemical-specific PRGs are concentration goals for individual chemicals for specific medium and land use combinations. The PRGs are referred to as risk-based because they have been calculated using risk assessment procedures. Risk-based calculations set concentration limits using both carcinogenic or noncarcinogenic toxicity values under specific exposure pathways. The PRG is a concentration that is derived from a specified excess cancer risk level or hazard quotient. This report provides the ER Division with standardized PRGs which are integral to the Remedial Investigation/Feasibility Study process. By managing the assumptions and systems used in PRG derivation, the Environmental Restoration Risk Assessment Program will be able to control the level of quality assurance associated with these risk-based guideline values.

23357 (ES/ER/TM–112/R2) **Environmental restoration risk-based prioritization work package planning and risk ranking methodology. Revision 2.** Dail, J.L.; Nanstad, L.D.; White, R.K. Lockheed Martin Energy Systems, Inc., Oak Ridge, TN (United States). Jun 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95015374. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Restoration Program.

This document presents the risk-based prioritization methodology developed to evaluate and rank Environmental Restoration (ER) work packages at the five US Department of Energy, Oak Ridge Field Office (DOE-ORO) sites [i.e., Oak Ridge K-25 Site (K-25), Portsmouth Gaseous Diffusion Plant (PORTS), Paducah Gaseous Diffusion Plant (PGDP), Oak Ridge National Laboratory (ORNL), and the Oak Ridge Y-12 Plant (Y-12)], the ER Off-site Program, and Central ER. This prioritization methodology was developed to support the increased rigor and formality of work planning in the overall conduct of operations within the DOE-ORO ER Program. Prioritization is conducted as an integral component of the fiscal ER funding cycle to establish program budget priorities. The purpose of the ER risk-based prioritization methodology is to provide ER management with the tools and processes needed to evaluate, compare, prioritize, and justify fiscal budget decisions for a diverse set of remedial action, decontamination and decommissioning, and waste management activities. The methodology provides the ER Program with a framework for (1) organizing information about identified DOE-ORO environmental problems, (2) generating qualitative assessments of the long- and short-term risks posed by DOE-ORO environmental problems, and (3) evaluating the benefits associated with candidate work packages designed to reduce those risks. Prioritization is conducted to rank ER work packages on the basis of the overall value (e.g., risk reduction, stakeholder confidence) each package provides to the ER Program. Application of the methodology yields individual work package "scores" and rankings that are used to develop fiscal budget requests. This document presents the technical basis for the decision support tools and process.

23358 (FEMP–2388) **Radium bearing waste disposal.** Tope, W.G. (Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States)); Nixon, D.A.; Smith, M.L.; Stone, T.J.; Vogel, R.A.; Schofield, W.D. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950401–11: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United

States), 30 Apr - 1 may 1995). Order Number DE95013793. Source: OSTI; NTIS; INIS; GPO Dep.

Fernald radium bearing ore residue waste, stored within Silos 1 and 2 (K-65) and Silo 3, will be vitrified for disposal at the Nevada Test Site (NTS). A comprehensive, parametric evaluation of waste form, packaging, and transportation alternatives was completed to identify the most cost-effective approach. The impacts of waste loading, waste form, regulatory requirements, NTS waste acceptance criteria, as-low-as-reasonably-achievable principles, and material handling costs were factored into the recommended approach.

23359 (LA-UR–95-1267) **Accident selection methodology for TA-55 FSAR.** Letellier, B.C. (and others); Pan, P.Y.; Sasser, M.K. Los Alamos National Lab., NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9506205–1: 5. annual safety analysis workshop of the Energy Facility Contractors Group (EFCOG), Augusta, GA (United States), 19-23 Jun 1995). Order Number DE95014017. Source: OSTI; NTIS; INIS; GPO Dep.

In the past, the selection of representative accidents for refined analysis from the numerous scenarios identified in hazards analyses (HAs) has involved significant judgment and has been difficult to defend. As part of upgrading the Final Safety Analysis Report (FSAR) for the TA-55 plutonium facility at the Los Alamos National Laboratory, an accident selection process was developed that is mostly mechanical and reproducible in nature and fulfills the requirements of the Department of Energy (DOE) Standard 3009 and DOE Order 5480.23. Among the objectives specified by this guidance are the requirements that accident screening (1) consider accidents during normal and abnormal operating conditions, (2) consider both design basis and beyond design basis accidents, (3) characterize accidents by category (operational, natural phenomena, etc.) and by type (spill, explosion, fire, etc.), and (4) identify accidents that bound all foreseeable accident types. The accident selection process described here in the context of the TA-55 FSAR is applicable to all types of DOE facilities.

23360 (LA-UR–95-1390) **Integrated chemical/biological treatment of paint stripper mixed waste: Metals toxicity and separation.** Vanderberg-Twary, L.; Grumbine, R.K.; Foreman, T.; Hanners, J.L.; Brainard, J.R.; Sauer, N.N.; Unkefer, P.J. Los Alamos National Lab., NM (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950877–13: 3. American Society for Mechanical Engineers biannual mixed waste symposium, Baltimore, MD (United States), 7-11 Aug 1995). Order Number DE95012055. Source: OSTI; NTIS; INIS; GPO Dep.

The DOE complex has generated vast quantities of complex heterogeneous mixed wastes. Paint stripper waste (PSW) is a complex waste that arose from decontamination and decommissioning activities. It contains paint stripper, cheesecloth, cellulose-based paints with Pb and Cr, and suspect Pu. Los Alamos National Laboratory has 150–200 barrels of PSW and other national laboratories such as Rocky Flats Plant have many more barrels of heterogeneous waste. Few technologies exist that can treat this complex waste. Our approach to solving this problem is the integration of two established technologies: biodegradation and metals chelation.

23361 (MMSC-EM–95011) **Pinellas Plant Annual Site Environmental Report for calendar year 1994.** Lockheed Martin Specialty Components, Inc., Largo, FL (United States). Jun 1995. 146p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-92AL73000. Order Number DE95014021. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents a comprehensive summary of the results of the Environmental Monitoring, Waste Management, and Environmental Restoration Programs at the Pinellas Plant, in Pinellas County, Florida for 1994. This report also includes the plant's performance in the areas of compliance with applicable regulatory requirements and standards and identifies major Environmental, Safety and Health Program initiatives and accomplishments for 1994. As a result of the end of Department of Energy Defense Programs mission production on September 30, 1994, considerable changes at the Pinellas Plant occurred. These changes, which included transitioning the plant toward alternate use in support of economic development and safe shutdown, both increased and heightened Environmental, Safety and Health responsibilities. In December 1994, the Department of Energy announced it had reached an agreement to sell the Pinellas Plant to the Pinellas County Industry Council in March 1995. The plant is being leased back by the Department of Energy through September 1997 to complete safe shutdown, reconfiguration, transfer of equipment to other Department of Energy production facilities, and transition to commercial ventures. Permit modifications and transfers will be completed during 1995 to reflect the new ownership by the Pinellas County Industry Council and to include new tenants as needed.

23362 (ORISE–93/J-42) **Data collection, validation, and description for the Oak Ridge nuclear facilities mortality study.** Watkins, J.P. (Oak Ridge Inst. for Science and Education, TN (United States). Center for Epidemiologic Research); Reagan, J.L.; Cragle, D.L.; West, C.M.; Tankersley, W.G.; Frome, E.L.; Crawford-Brown, D.J. Oak Ridge Inst. for Science and Education, TN (United States). [1995]. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-76OR00033. Order Number DE95013655. Source: OSTI; NTIS; INIS; GPO Dep.

To investigate the long-term health effects of protracted occupational exposure to low levels of ionizing radiation, a mortality study was initiated by pooling data for 118,588 workers hired between 1943 and 1982, at three Department of Energy (DOE) facilities in Oak Ridge, Tennessee, with follow-up through 1984. Topics for this discussion will include issues involving the collection and validation of data for individuals in the study cohort, and characteristics of their demographic and radiation exposure data. Since the data were compiled between the late 1960s and the present under the direction of several principal investigators, it was essential to verify data precision and to understand how exposure data were generated prior to beginning any analysis. A stratified random sample of workers in the cohort was chosen for verification of their computerized data as it appeared in the database. Original source documents were reviewed to verify demographic data, as well as internal and external radiation exposure data. Extensive effort was expended to document the personal radiation monitoring policies and types of dosimeters used at each facility over the 42 years included in the study. Characteristics of internal and external exposure data by facility and year were examined by graphical methods with the intent of combining these monitoring data over time and across facilities.

23363 (ORNL/RASA–94/3) **Results of the supplementary radiological survey at the former C. H. Schnoor and Company site, 644 Garfield Street, Springdale, Pennsylvania (CVP001).** Coleman, R.L.; Murray, M.E.; Brown, K.S. Oak Ridge National Lab., TN (United States). Apr 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95012542. Source: OSTI; NTIS; INIS; GPO Dep.

At the request of the U.S. Department of Energy (DOE), a team from Oak Ridge National Laboratory conducted radiological surveys at the former C. H. Schnoor and Company site, 644 Garfield Street, Springdale, Pennsylvania. The surveys were performed on October 11-13 and November 14-17, 1993, in order to provide a complete characterization prior to site remediation. The surveys included a gamma scan and a scan for surface contamination from alpha and beta-gamma emitters; measurement of direct and removable alpha and beta-gamma levels; systematic FIDLER measurements at the surface of the concrete; and the collection of samples from boreholes for radionuclide analysis. Results of the surveys revealed radionuclide concentrations and surface contamination levels in excess of applicable DOE guidelines for ^{238}U. Radionuclide distributions were higher than typical background levels for ^{238}U in the Springdale, Pennsylvania area.

23364 (ORNL/RASA–95/3) **Radiological verification survey results at 14 Peck Ave., Pequannock, New Jersey (PJ001V).** Rodriguez, R.E.; Johnson, C.A. Oak Ridge National Lab., TN (United States). May 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95014467. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) conducted remedial action during 1993 at the Pompton Plains Railroad Spur and eight vicinity properties in the Wayne and Pequannock Townships in

New Jersey as part of the Formerly Utilized Sites Remedial Action Program (FUSRAP). These properties are in the vicinity of the DOE-owned Wayne Interim Storage Site (WISS), formerly the W. R. Grace facility. The property at 14 Peck Ave., Pequannock, New Jersey is one of these vicinity properties. At the request of DOE, a team from Oak Ridge National Laboratory conducted an independent radiological verification survey at this property. The purpose of the survey, conducted between September and December 1993, was to confirm the success of the remedial actions performed to remove any radioactive materials in excess of the identified guidelines. The verification survey included surface gamma scans and gamma readings at 1 meter, beta-gamma scans, and the collection of soil and debris samples for radionuclide analysis. Results of the survey demonstrated that all radiological measurements on the property at 14 Peck Ave. were within applicable DOE guidelines. Based on the results of the remedial action data and confirmed by the verification survey data, the portions of the site that had been remediated during this action successfully meet the DOE remedial action objectives.

23365 (PNL–10637) **Identification of physical properties for the retrieval data quality objective process.** Gates, C.M.; Beckette, M.R. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015443. Source: OSTI; NTIS; INIS; GPO Dep.

This activity supports the retrieval data quality objective (DQO) process by identifying the material properties that are important to the design, development, and operation of retrieval equipment; the activity also provides justification for characterizing those properties. These properties, which control tank waste behavior during retrieval operations, are also critical to the development of valid physical simulants for designing retrieval equipment. The waste is to be retrieved in a series of four steps. First, a selected retrieval technology breaks up or dislodges the waste into subsequently smaller pieces. Then, the dislodged waste is conveyed out of the tank through the conveyance line. Next, the waste flows into a separator unit that separates the gaseous phase from the liquid and solid phases. Finally, a unit may be present to condition the slurried waste before transporting it to the treatment facility. This document describes the characterization needs for the proposed processes to accomplish waste retrieval. Baseline mobilization technologies include mixer pump technology, sluicing, and high-pressure water-jet cutting. Other processes that are discussed in this document include slurry formation, pneumatic conveyance, and slurry transport. Section 2.0 gives a background of the DQO process and the different retrieval technologies. Section 3.0 provides the mechanistic descriptions and material properties critical to the different technologies and processes. Supplemental information on specific technologies and processes is provided in the appendices. Appendix A contains a preliminary sluicing model, and Appendices B and C cover pneumatic transport and slurry transport, respectively, as prepared for this document. Appendix D contains sample calculations for various equations.

23366 (PNL-SA–24280) **Deploying in situ bioremediation at the Hanford Site.** Truex, M.J.; Johnson, C.D.; Newcomer, D.R.; Doremus, L.A.; Hooker, B.S.; Peyton, B.M.; Skeen, R.S.; Chilakapati, A. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941124–23: 33. Hanford symposium on health and the environment: symposium on in-situ remediation–scientific basis for current and future technologies, Richland, WA (United States), 7-11 Nov 1994). Order Number DE95014625. Source: OSTI; NTIS; INIS; GPO Dep.

An innovative in-situ bioremediation technology was developed by Pacific Northwest Laboratory (PNL) to destroy nitrate and carbon tetrachloride ($CC1_4$) in the Hanford ground water. The goal of this in-situ treatment process is to stimulate native microorganisms to degrade nitrate and CCl_4. Nutrient solutions are distributed in the contaminated aquifer to create a biological treatment zone. This technology is being demonstrated at the US Department of Energy's Hanford Site to provide the design, operating, and cost information needed to assess its effectiveness in contaminated ground water. The process design and field operations for demonstration of this technology are influenced by the physical, chemical, and microbiological properties observed at the site. A description of the technology is presented including the well network design, nutrient injection equipment, and means for controlling the hydraulics and microbial reactions of the treatment process.

23367 (RFP–4969) **Summary report of incineration plenum fire: Building 771, July 2, 1980.** Fretthold, J.K. (ed.). Rocky Flats Environmental Technology Site, Golden, CO (United States). 31 May 1995. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90RF62349. Order Number DE95014665. Source: OSTI; NTIS; INIS; GPO Dep.

At about 1100 on July 2, 1980, a temperature rise above normal was recorded on charts monitoring operation of the incinerator in Room 149, Building 771. The plenum overheat alarm sounded at 1215, emergency actions initiated, and the fire was extinguished and mop-up began at about 1300. Investigation determined that the fire in the plenum was caused by a heat rise in the system, a deteriorated bypass valve on the No. 3 heat exchanger (KOH scrubber), nitration of the urethane seal on the HEPA filter media to the filter frame, and accumulation of metallic fines on the filter media. It was concluded that the management system responded properly, except for the ring- down system to activate the Emergency Operations Center.

23368 (RFP–4971) **Integrated chemical management system: A tool for managing chemical information at the Rocky Flats Environmental Technology Site.** Costain, D. (Kaiser-Hill Co., Golden, CO (United States)). EG and G Rocky Flats, Inc., Golden, CO (United States). [1995]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90RF62349. (CONF-9506210–2: 10. annual Federal facilities conference, Denver, CO (United States), 29 Jun 1995). Order Number DE95014671. Source: OSTI; NTIS; GPO Dep.

The Integrated Chemical Management System is a computer-based chemical information at the Rocky Flats Environmental Technology Site. Chemical containers are identified by bar code labels and information on the type, quantity and location of chemicals are tracked on individual data bases in separate buildings. Chemical inventories from multiple buildings are uploaded to a central sitewide chemical data base where reports are available from Product, Waste, and Chemical Use modules. Hazardous chemical information is provided by a separate Material Safety Data Sheet module and excess chemicals are traded between chemical owners and users with the aid of the Chemical Exchange Module.

23369 (SAND–94-2611) **Identification of remediation needs and technology development focus areas for the Environmental Restoration (ER) Project at Sandia National Laboratories/New Mexico (SNL/NM).** Tucker, M.D. (Sandia National Labs., Albuquerque, NM (United States). Site Restoration Technology Program Office); Valdez, J.M.; Khan, M.A. Sandia National Labs., Albuquerque, NM (United States). Jun 1995. 95p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95015010. Source: OSTI; NTIS; INIS; GPO Dep.

The Environmental Restoration (ER) Project has been tasked with the characterization, assessment, remediation and long-term monitoring of contaminated waste sites at Sandia National Laboratories/New Mexico (SNL/NM). Many of these sites will require remediation which will involve the use of baseline technologies, innovative technologies that are currently under development, and new methods which will be developed in the near future. The Technology Applications Program (TAP) supports the ER Project and is responsible for development of new technologies for use at the contaminated waste sites, including technologies that will be used for remediation and restoration of these sites. The purpose of this report is to define the remediation needs of the ER Project and to identify those remediation needs for which the baseline technologies and the current development efforts are inadequate. The area between the remediation needs and the existing baseline/innovative technology base represents a technology gap which must be filled in order to remediate contaminated waste sites at SNL/NM economically and efficiently. In the first part of this report, the remediation needs of the ER Project are defined by both the

ER Project task leaders and by TAP personnel. The next section outlines the baseline technologies, including EPA defined Best Demonstrated Available Technologies (BDATs), that are applicable at SNL/NM ER sites. This is followed by recommendations of innovative technologies that are currently being developed that may also be applicable at SNL/NM ER sites. Finally, the gap between the existing baseline/innovative technology base and the remediation needs is identified. This technology gap will help define the future direction of technology development for the ER Project.

23370 (SAND–95-1304) **Building 891 hazards assessment document.** Banda, Z.; Barnett, B. Sandia National Labs., Albuquerque, NM (United States). Jun 1995. 280p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95015407. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy Order 5500.3A requires facility-specific hazards assessments be prepared, maintained, and used for emergency planning purposes. This hazards assessment document describes the chemical and radiological hazards associated with Building 891. The entire inventory was screened according to the potential airborne impact to onsite and offsite individuals. The air dispersion model, ALOHA, estimated pollutant concentrations downwind from the source of a release, taking into consideration the toxicological and physical characteristics of the release site, the atmospheric conditions, and the circumstances of the release. The greatest distance at which a postulated facility event will produce consequences exceeding the Early Severe Health Effects threshold is 33 meters. The highest emergency classification is a Site Area Emergency. The Emergency Planning Zone is a nominal 50 meter area that conforms to DOE boundaries and physical/jurisdictional boundaries such as fence lines and streets.

23371 (UCRL-JC–119038) **DOE natural phenomenal hazards design and evaluation criteria.** Murray, R.C. (Lawrence Livermore National Lab., CA (United States)); Nelson, T.A.; Short, S.A.; Kennedy, R.P.; Chander, H.; Hill, J.R.; Kimball, J.K. Lawrence Livermore National Lab., CA (United States). Oct 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941227–6: 5. symposium on current issues related to nuclear power plant structure, equipment and piping, Orlando, FL (United States), 14-16 Dec 1994). Order Number DE95011762. Source: OSTI; NTIS; INIS; GPO Dep.

It is the policy of the Department of Energy (DOE) to design, construct, and operate DOE facilities so that workers, the general public, and the environment are protected from the impacts of natural phenomena hazards (NPH). Furthermore, DOE has established explicit goals of acceptable risk for NPH performance. As a result, natural phenomena hazard (earthquake, extreme wind, and flood) design and evaluation criteria for DOE facilities have been developed based on target probabilistic performance goals. These criteria include selection of design/evaluation NPH input from probabilistic hazard curves combined with commonly practiced deterministic response evaluation methods and acceptance criteria with controlled levels of conservatism. For earthquake considerations, conservatism is intentionally introduced in specification of material strengths and capacities, in the allowance of limited inelastic behavior, and by a seismic scale factor. Criteria have been developed following a graded approach for several performance goals ranging from that appropriate for normal-use facilities to that appropriate for facilities involving hazardous or critical operations. Performance goals are comprised of qualitative expressions of acceptable behavior and of target quantitative probabilities that acceptable limits of behavior are maintained. The criteria are simple procedures but have a rigorous basis. This paper addresses DOE seismic design and evaluation criteria.

23372 (WHC-SA–2623) **Tank waste remediation system: An update.** Alumkal, W.T.; Babad, H.; Dunford, G.L.; Honeyman, J.O.; Wodrich, D.D. Westinghouse Hanford Co., Richland, WA (United States). Feb 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950216–151: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95013487. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy's Hanford Site, located in southeastern Washington State, contains the largest amount and the most diverse collection of highly radioactive waste in the US. High-level radioactive waste has been stored at the Hanford Site in large, underground tanks since 1944. Approximately 217,000 M^3 (57 Mgal) of caustic liquids, slurries, saltcakes, and sludges have accumulated in 177 tanks. In addition, significant amounts of ^{90}Sr and ^{137}Cs were removed from the tank waste, converted to salts, doubly encapsulated in metal containers, and stored in water basins. The Tank Waste Remediation System Program was established by the US Department of Energy in 1991 to safely manage and immobilize these wastes in anticipation of permanent disposal of the high-level waste fraction in a geologic repository. Since 1991, significant progress has been made in resolving waste tank safety issues, upgrading Tank Farm facilities and operations, and developing a new strategy for retrieving, treating, and immobilizing the waste for disposal.

23373 (WHC-SD-CP-CR–036) **PFP supply fan motor starters.** Keck, R.D. Westinghouse Hanford Co., Richland, WA (United States). 31 May 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014309. Source: OSTI; NTIS; INIS; GPO Dep.

The Plutonium Finishing Plant (PFP) is currently stabilizing about 25 kg of Pu sludge; upon completion of this task, PFP will be maintained in a safe standby condition to await decision from the PFP NEPA review. It can take about 10 years to initiate and complete terminal cleanout after this; the facility will then be decommissioned and decontaminated. The 234-5Z ventilation system must continue to operate until terminal cleanout. Part of the ventilation system is the seismic fan shutdown system which shuts down the ventilation supply fans in case of strong earthquake. This document presents criteria for installing solid state, reduced voltage motor starters and isolation contactors for the 8 main ventilation supply fans. The isolation contactors will shutdown the supply fans in event of earthquake.

23374 (WHC-SD-CP-MAR–002) **PUREX Plant deactivation mission analysis report.** Lund, D.P. Westinghouse Hanford Co., Richland, WA (United States). 24 May 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013878. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the PUREX Deactivation Project mission analysis is to define the problem to be addressed by the PUREX mission, and to lay the ground work for further system definition. The mission analysis is an important first step in the System Engineering (SE) process. This report presents the results of the PUREX Deactivation Project mission analysis. The purpose of the PUREX Deactivation Project is to prepare PUREX for Decontamination and Decommissioning within a five year time frame. This will be accomplished by establishing a passively safe and environmentally secure configuration of the PUREX Plant, that can be preserved for a 10-year horizon. During deactivation, appropriate portions of the safety envelop will be maintained to ensure deactivation takes place in a safe and regulatory compliant manner.

23375 (WHC-SD-CP-SDD–004-Rev.2) **Definition and means of maintaining the supply ventilation system seismic shutdown portion of the PFP safety envelope. Revision 2.** Keck, R.D. Westinghouse Hanford Co., Richland, WA (United States). 27 Jun 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015547. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the modifications to the ventilation system for the Plutonium Finishing Plant. Topics discussed in this report include; system functional requirements, evaluations of equipment, a list of drawings showing the safety envelope boundaries; list of safety envelope equipment, functional requirements for individual safety envelope equipment, and a list of the operational, maintenance and surveillance procedures necessary to operate and maintain the system equipment.

23376 (WHC-SD-TP-SEP–034) **Safety evaluation for packaging CPC metal boxes.** Romano, T. Westinghouse Hanford Co., Richland, WA (United States). 15 May 1995. 2p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012577. Source: OSTI; NTIS; INIS; GPO Dep.

This Safety Evaluation for Packaging (SEP) provides authorization for the use of Container Products Corporation (CPC) metal boxes, as described in this document, for the interarea shipment of radioactive contaminated equipment and debris for storage in the Central Waste Complex (CWC) or T Plant located in the 200 West Area. Authorization is granted until November 30, 1995. The CPC boxes included in this SEP were originally procured as US Department of Transportation (DOT) Specification 7A Type A boxes. A review of the documentation provided by the manufacturer revealed the documentation did not adequately demonstrate compliance to the 4 ft drop test requirement of 49 CFR 173.465(c). Preparation of a SEP is necessary to document the equivalent safety of the onsite shipment in lieu of meeting DOT packaging requirements until adequate documentation is received. The equivalent safety of the shipment is based on the fact that the radioactive contents consist of contaminated equipment and debris which are not dispersible. Each piece is wrapped in two layers of no less than 4 mil plastic prior to being placed in the box which has an additional 10 mil liner. Pointed objects and sharp edges are padded to prevent puncture of the plastic liner and wrapping.

23377 (WHC-SD-WM-ES–337) **Cost benefit and risk assessment for selected tank waste process testing alternatives.** Gasper, K.A. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Foster-Wheeler Environmental Corp., Richland, WA (United States). 22 May 1995. 644p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013837. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy has established the Tank Waste Remediation System (TWRS) program to safely manage wastes currently stored in underground tank at the Hanford Site. A TWRS testing and development strategy was recently developed to define long-range TWRS testing plans. The testing and development strategy considered four alternatives. The primary variable in the alternatives is the level of pilot-scale testing involving actual waste. This study evaluates the cost benefit and risks associated with the four alternatives. Four types of risk were evaluated: programmatic schedule risk, process mishap risk, worker risk, and public health risk. The structure of this report is as follows: Section 1 introduces the report subject; Section 2 describes the test strategy alternative evaluation; Section 3 describes the approach used in this study to assess risk and cost benefit; Section 4 describes the assessment methodologies for costs and risks; Section 5 describes the bases and assumptions used to estimate the costs and risks; Section 6 presents the detailed costs and risks; and Section 7 describes the results of the cost benefit analysis and presents conclusions.

23378 (WHC-SP–0564-37) **Westinghouse Hanford Company Health and Safety Performance Report. First quarter calendar year 1995.** Lansing, K.A. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 94p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013514. Source: OSTI; NTIS; GPO Dep.

During the first quarter of CY 1995, four of the WHC sitewide ALARA performance goals were completed on or ahead of schedule. One of the completed goals related to reduction of radiological areas at WHC-managed facilities. Due to anticipated resource reductions and increased scope of work, several facilities escalated their reduction schedule. This allowed the ALARA goal to be completed and exceeded ahead of schedule. Industrial Safety and Health initiatives are being pursued in areas such as workplace ergonomics, safety training, and standards development. Positive efforts are ongoing in the areas of management commitment and employee involvement through the WHC Voluntary Protection Program. Successful implementation continues through the President's Accident Prevention Council (PAPC) and division employee Accident Prevention Councils. The Company now has established CY 1995 PAPC goals. Major programmatic accomplishments completed during this reporting period include the Department of Energy-Headquarters (DOE-HQ) formally endorsing the Radiological Control organization's approach toward development of the Radiation Protection Program (RPP) document. The DOE-HQ has recognized the significant contributions and leadership that Radiological Control has provided in planning and implementation of this "model example of an RPP" across the DOE complex and is encouraging other sites to contact WHC for assistance in developing their RPPs.

23379 (WSRC-TR–93-301-Rev.4) **Human Reliability Analysis for In-Tank Precipitation Alignment and Startup of Emergency Purge Ventilation Equipment. Revision 4.** Shapiro, B.J.; Britt, T.E. Westinghouse Savannah River Co., Aiken, SC (United States). Jun 1995. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060156. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the methodology used for calculating the human error probability for establishing air based ventilation using emergency purge ventilation equipment on In-Tank Precipitation (ITP) processing tanks 48 and 49 after a failure of the nitrogen purge system following a seismic event. The analyses were performed according to THERP (Technique for Human Error Rate Prediction) as describes in NUREG/CR-1278-F.

23380 (WSRC-TR–94-0540) **Isothermal heat measurements of TBP-nitric acid solutions.** Smith, J.R.; Cavin, W.S. Westinghouse Savannah River Co., Aiken, SC (United States). 16 Dec 1994. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95014731. Source: OSTI; NTIS; INIS; GPO Dep.

Net heats of reaction were measured in an isothermal calorimeter for both single phase (organic) and two phase (organic and aqueous) TBP/HNO_3 reacting solutions at temperatures above 100 C. The oxidation rate constant was determined to be 5.4E-4 min^{-1} at 110 C for an open "vented" system as compared to 1.33 E-3 min^{-1} in the closed system. The heat released per unit material oxidized was also reduced. The oxidation in both phases was found to be first order in nitric acid and pseudo-zero order in butylnitrate and water. The hydrolysis (esterification) rate constant determined by Nichols' (1.33E-3 min^{-1}) fit the experimental data from this work well. Forced evaporation of the volatile components by the product gases from oxidation resulted in a cooling mechanism which more than balanced the heat from the oxidation reaction in the two-phased systems. Rate expressions were derived and rate constants determined for both the single and two phase systems. An approximating mathematical model was developed to fit the experimental data and to extrapolate beyond the experimental conditions. This model shows that one foot of "reacting" 14.3M HNO_3 aqueous phase solution at 121 C will transport sufficient water to the organic phase to replace evaporative losses, maintaining endothermicity, for organic layers up to 12.2 ÷ 6.0 feet deep. If the pressure in a reacting system is allowed to increase due to insufficient venting the temperature of the organic phase would increase in temperature to reach a new equilibrium. The rate of oxidation would increase not only due to the increase in temperature but also from the increased concentration of dissolved HNO_3 reduction products. Another important factor is that the cooling system described in this work becomes less effective as the total pressure increases. These factors probably contributed to the explosion at Tomsk.

23381 (BNL–60690) **HEU age determination.** Moorthy, A.R.; Kato, W.Y. Brookhaven National Lab., Upton, NY (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-940748–100: 35. annual meeting of the Institute of Nuclear Materials Management (INMM), Naples, FL (United States), 17-20 Jul 1994). Order Number DE95014520. Source: OSTI; NTIS; INIS; GPO Dep.

A criteria that a sample of highly enriched uranium (HEU) had come from a weapons stockpile and not newly produced in an enrichment plant is to show that the HEU had been produced a significant time in the past. The time since the HEU has produced in an enrichment plant is defined as the age of the HEU in this paper. The HEU age is determined by measuring quantitatively the

daughter products ^{230}Th and ^{231}Pa of ^{234}U and ^{235}U, respectively, by first chemical separation of the thorium and protactinium and then conducting alpha spectrometry of the daughter products.

23382 (DOE/AL/85832–T3) **Continuation application for the Amarillo National Resource Center for Plutonium, a higher education consortium consisting of Texas A and M University, Texas Tech University, and the University of Texas at Austin.** Amarillo National Resource Center for Plutonium, TX (United States). 29 Jun 1995. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC04-95AL85832. Order Number DE95015501. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the 5 tasks to be covered under this project and compiles budget information. Task 1 is to establish a Plutonium Information Resource, which has been established in Amarillo, Texas. Task 2, Advisory Functions, coordinates studies and activities relating to the disposition of excess weapons-grade plutonium. Task 3, Environmental, Public Health, and Safety, supports soil remediation activities. Task 4, Education and Outreach, is supporting four programs: K–12 education improvement in science and math courses; Academic intervention to identify and encourage high ability high school and middle school students with potential to become scientists and engineers; Graduate education evaluation; and Public outreach programs. Task 5, Plutonium and other Materials Studies, is currently funding two projects for the disposition of high explosives: a feasibility study of burning a mixture of high explosives and other materials in a commercial coal-fired power plant and synthesis of diamond by shock compression of bucky ball with explosives.

23383 (DOE/AL/85832–T6) **[Establish and manage a National Resource Center for plutonium, Quarterly report, April 1, 1995–June 30, 1995].** Mulder, R. Amarillo National Resource Center for Plutonium, TX (United States). 27 Jun 1995. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC04-95AL85832. Order Number DE95015526. Source: OSTI; NTIS; INIS; GPO Dep.

The initial phase of the Plutonium Information Resource is well under way. Board members developed linkages with Russian scientists and engineers and obtained names of technical team members. Nuclear proposals were reviewed by the Nuclear Review Group, and the proposals were modified to incorporate the review group's comments. Portions of the proposals were approved by the Governing Board. Proposals for education and outreach were reviewed by the Education Proposal Review Group, considered by the Governing Board and approved. The Senior Technical Review Group met to consider the R&D programs associated with fissile materials disposal. A newsletter was published. Progress continued on the high explosives demonstration project, on site-specific environmental work, and the multiattribute utility analysis. Center offices in Amarillo were furnished, equipment was purchased, and the lease was modified.

23384 (DOE/AL/85832–T7) **A methodology for the analysis and selection of alternatives for the disposition of surplus plutonium. Quarterly technical progress report, April 1, 1995–June 30, 1995.** Mulder, R. Amarillo National Resource Center for Plutonium, TX (United States). 5 Jul 1995. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC04-95AL85832. Order Number DE95015527. Source: OSTI; NTIS; INIS; GPO Dep.

The Office of Fissile Materials Disposition is currently involved in the development of a comprehensive approach to the long-term storage and disposition of fissile materials. A major objective of this effort is to provide a framework for US efforts to prevent the proliferation of nuclear weapons. This will entail both the elimination of excess highly enriched uranium and plutonium, and the insurance of the highest standards of safety, security, and international accountability. The Office of Fissile Materials Disposition is supporting an Interagency Working Group that has initiated a comprehensive review of alternatives for plutonium disposition which takes into account non-proliferation, economic, technical, institutional, schedule, environmental, and health and safety issues. These alternatives were identified by the development of screening criteria as a guide to the selection of alternatives that best achieve the fissile nuclear material long-term storage and disposition goals of the US Government.

23385 (HW–41274) **Americium-curium correction.** Reas, W.H. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 2 Feb 1956. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95014055. Source: OSTI; NTIS; GPO Dep.

23386 (ORNL/MD/LTR–13) **New glass material oxidation and dissolution system facility: Direct conversion of surplus fissile materials, spent nuclear fuel, and other material to high-level-waste glass. Storage and disposition of weapons-usable fissile materials programmatic environmental impact statement data report: Predecisional draft.** Forsberg, C.W. (Oak Ridge National Lab., TN (United States). Chemical Technology Div.); Elam, K.R.; Reich, W.J. Oak Ridge National Lab., TN (United States). 28 Mar 1995. 121p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95011767. Source: OSTI; NTIS; INIS; GPO Dep.

With the end of the Cold War, countries have excess plutonium and other materials from the reductions in inventories of nuclear weapons. It has been recommended that these surplus fissile materials (SFMs) be processed so that they are no more accessible than plutonium in spent nuclear fuel (SNF). This SNF standard, if adopted worldwide, would prevent rapid recovery of SFMs for the manufacture of nuclear weapons. This report provides for the PEIS the necessary input data on a new method for the disposition of SFMs: the simultaneous conversion of SFMs, SNF, and other highly radioactive materials into high-level-waste (HLW) glass. The SFMs include plutonium, neptunium, americium, and ^{233}U. The primary SFM is plutonium. The preferred SNF is degraded SNF, which may require processing before it can be accepted by a geological repository for disposal. The primary form of this SNF is Hanford-N SNF with preirradiation uranium enrichments between 0.95 and 1.08%. The final product is a plutonium, low-enriched-uranium, HLW, borosilicate glass for disposition in a geological repository. The proposed conversion process is the Glass Material Oxidation and Dissolution System (GMODS), which is a new process. The initial analysis of the GMODS process indicates that a MODS facility for this application would be similar in size and environmental impact to the Defense Waste Processing Facility (DWPF) at the Savannah River Site. Because of this, the detailed information available on DWPF was used as the basis for much of the GMODS input into the SFMs PEIS.

23387 (ORNL/TM–12979) **Independent verification of reprocessing input and process volumes. Progress report.** Smith, D.H.; Turner, M.L.; McBay, E.H.; Lewis, B.E.; Hobson, D.E.; Ehinger, M.H. Oak Ridge National Lab., TN (United States). Apr 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95014465. Source: OSTI; NTIS; INIS; GPO Dep.

One of the most difficult challenges in the nuclear fuel cycle is to establish a material balance for tanks containing spent fuel solutions. These tanks present an extremely hostile environment to the analyst, making determination of the amount of fissile material in them difficult. Historic methods used to determine the volumes of solutions in these tanks are usually based on use of tank geometry in conjunction with depth and density measurements, both of which vary with temperature and are normally controlled by the operator of the facility. Changes in the interior geometry of tanks due to addition of various types of equipment, minor structural modifications, and accumulation of insoluble materials at the bottom and on the interior surfaces of the tanks affect the available volume and make difficult its accurate measurement. For safeguards purposes, it is thus desirable to have a repeatable method of volume determination independent of the operator and other factors. To determine the quantity of uranium and plutonium in a given tank, aliquots are withdrawn and subjected to analysis; both isotopic abundances and the amount of each element present are determined. Isotope dilution mass spectrometry is the method of choice for quantitative measurements in this application and yields values more precise and accurate than other methods. In the research that is the focus

of this project, the application of isotope dilution mass spectrometry has been extended, through use of a double lutetium spike, to the determination of the volume (or weight) of the solution in tanks of any size and shape, regardless of the nature of the solutions within them. The goal of the work described in this report was to develop hot-cell compatible chemical separation procedures for lutetium and to try to devise a better method for quantitatively introducing natural lutetium to the tank.

23388 (PNL-D–376) **Impact assessment of additional safeguards and security controls on selected nuclides.** Simpson, C.L. Pacific Northwest Lab., Richland, WA (United States). 11 Oct 1984. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012666. Source: OSTI; NTIS; GPO Dep.

Battelle, Pacific Northwest Laboratory (PNL) has reviewed the current and projected inventory quantities of the selected nuclides in the reference letter and completed a quick assessment of the impacts of the additional safeguards and security controls. The areas that will be impacted are; physical protection, measurement systems, manual revisions, computer systems, and training.

23389 (PNL-D–405) **Assessment of Critical Mass Laboratory safeguards and security upgrades.** Merrill, B.J.; DeMyer, J.J. Pacific Northwest Lab., Richland, WA (United States). 31 May 1985. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012668. Source: OSTI; NTIS; GPO Dep.

Pacific Northwest Laboratory (PNL) conducted an evaluation of the safeguards and security systems at the Critical Mass Laboratory (CML) in February 1985, to identify appropriate upgrading actions necessary to ensure that effective and efficient systems consistent with DOE-RL policies, procedures, and site priorities are in place. Since that evaluation, there have been changes in Patrol contingency philosophy, response tactics, and distribution of manpower. Because of these changes, and at the request of DOE-RL, PNL has re-evaluated the safeguards and security systems in place at CML.

23390 (PNL-SA–23817) **Tamper tape seals.** Wright, B.W.; Undem, H.A. Pacific Northwest Lab., Richland, WA (United States). Jul 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-940748–101: 35. annual meeting of the Institute of Nuclear Materials Management (INMM), Naples, FL (United States), 17-20 Jul 1994). Order Number DE95014626. Source: OSTI; NTIS; INIS; GPO Dep.

Tamper tapes are appealing for many applications due to their ease of use and relative robustness. Applications include seals for temporary area denial, protection of sensitive equipment, chain-of-custody audit trails, and inventory control practices. A next generation of adhesive tamper tapes is being developed that combines the best features of commercially available devices with additional state-of-the-art features in tamper indication, tamper-resistance, and counterfeit-resistance. The additional features are based on U.S. Department of Energy (DOE) research and development (R&D) activities that were originally associated with preparations for the Strategic Arms Reduction Treaty (START). New features include rapid-set, chemical-cure adhesive systems that allow user-friendly application and layered levels of counterfeit-resistance based on unique "fingerprint" characteristics that can be accessed as desired.

23391 (PNL-SA–26411) **Basic visual observation skills training course. Final report.** Toquam, J.L.; Morris. F.A.; Griggs, J.R. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (ISPO–378). Order Number DE95015179. Source: OSTI; NTIS; INIS; GPO Dep.

This is the third report in a series prepared to assist the International Atomic Energy Agency (IAEA or Agency) in enhancing the effectiveness of its international safeguards inspections through inspector training in Observation Skills. The first report (Phase 1) was essentially exploratory. It defined Observation Skills' broadly to include all appropriate cognitive, communications, and interpersonal techniques that have the potential to help IAEA safeguards inspectors function more effectively. The second report (Phase 2) provided a more specific basis for the actual design and delivery of Observation Skills training to IAEA inspectors. The present report (Phase 3) documents the design of a Basic Visual Observation Skills course and delivery of the course to safeguards inspectors at IAEA Headquarters Vienna in February and May of 1995. The purpose of the course is to help safeguards inspectors evaluate and improve their skills in making observations during inspections and in evaluating and interpreting this information. The course is basic in the sense that it provides training in skills which are generally applicable to inspections of all types of facilities and activities subject to safeguards. The course is designed for 16 hours of classroom delivery, ideally in four 4-hour sessions over a period of four days. The first 12 hours provide training in five skill areas: perception and recognition; attention and attention to detail; memory; mental imaging, mapping, and modeling skills; and judgment and decision making. Following the training in each of the five skill areas is an Integrating Exercise involving a simulated safeguards inspection.

23392 (PNL-SA–26411-App.A) **Basic visual observation skills training course: Appendix A. Final report.** Toquam, J.L.; Morris, F.A.; Griggs, J.R. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 187p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (ISPO–378-App.A). Order Number DE95015180. Source: OSTI; NTIS; INIS; GPO Dep.

Includes vugraphs.

The purpose of the basic visual observation skills course is to help safeguards inspectors evaluate and improve their skills in making observations during inspections and in evaluating and interpreting this information. The first 12 hours of the course provide training in five skill areas: perception and recognition; attention to detail; memory; mental imaging, mapping, and modeling skills; and judgment and decision making. Following this training is an integrating exercise involving a simulated safeguards inspection. This report contains the course manual and materials.

23393 (PNL-SA–26411-App.B) **Basic visual observation skills training course: Appendix B. Final report.** Toquam, J.L.; Morris, F.A.; Griggs, J.R. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 117p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (ISPO–378-App.B). Order Number DE95015181. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the basic visual observation skills course is to help safeguards inspectors evaluate and improve their skills in making observations during inspections and in evaluating and interpreting this information. The first 12 hours of the course provide training in five skill areas: perception and recognition; attention to detail; memory; mental imaging, mapping, and modeling skills; and judgment and decision making. Following this training is an integrating exercise involving a simulated safeguards inspection. This report contains the in-class exercises in the five skill areas; pre- and post-course exercises in closure, hidden figures, map memory, and mental rotations; the final examination; a training evaluation form; and the integrating exercise.

23394 (RFP–4973) **Nondestructive assay (NDA) of fissile material solutions in tanks at Rocky Flats Environmental Technology Site.** Fleissner, J.G.; Lamb, F.W.; Maul, M.R. Safe Sites of Colorado, Golden, CO (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90RF62349. (CONF-950787–6: 36. annual meeting of the Institute for Nuclear Materials Management, Palm Desert, CA (United States), 9-12 Jul 1995). Order Number DE95015352. Source: OSTI; NTiS; INIS; GPO Dep.

Nondestructive assay of holdup in solution tanks at Rocky Flats has been performed to address criticality safety concerns since 1974. Destructive analysis techniques were used for quantification of the fissile material content of the tanks. With termination of operations in 1989, including sparging and sampling of tanks, a need arose for nondestructive assay of solutions in tanks to confirm previous inventory values. Gamma ray measurement methodologies were investigated and several techniques, including Poor Man's Densitometry were implemented. These techniques have been applied to several different types of tanks including: annular, raschig ring filled, and pencil tanks. For the annular tanks "Poor Man's

Densitometry" is used, with the densities of the measured solutions normalized to the value of one "accepted" concentration tank. Measurement uncertainties for this technique has been better than was anticipated. Measurements are also performed at several levels to attempt to detect variations in density. For the current tank draining program, solution in tanks is assayed by the NDA gamma-ray technique before draining. Measurement results were obtained for plutonium, uranium, and mixtures of U/Pu solutions for concentrations ranging from less than 0.5 g/l to 150 g/l. Tanks with expected concentrations were used to establish a relationship between concentration and count rate. "Bootstrapping" calibration techniques were used in some cases to obtain quantitative results.

23395 (SAND–94-3151C) **Reliable motion detection of small targets in video with low signal-to-clutter ratios.** Nichols, S.A.; Naylor, R.B. Sandia National Labs., Albuquerque, NM (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950793–2: 40. annual meeting of the Society of Photo-Optical Instrumentation Engineers: international symposium on optical science, engineering and instrumentation, San Diego, CA (United States), 9-14 Jul 1995). Order Number DE95013859. Source: OSTI; NTIS; GPO Dep.

Studies show that vigilance decreases rapidly after several minutes when human operators are required to search live video for infrequent intrusion detections. Therefore, there is a need for systems which can automatically detect targets in live video and reserve the operator's attention for assessment only. Thus far, automated systems have not simultaneously provided adequate detection sensitivity, false alarm suppression, and ease of setup when used in external, unconstrained environments. This unsatisfactory performance can be exacerbated by poor video imagery with low contrast, high noise, dynamic clutter, image misregistration, and/or the presence of small, slow, or erratically moving targets. This paper describes a highly adaptive video motion detection and tracking algorithm which has been developed as part of Sandia's Advanced Exterior Sensor (AES) program. The AES is a wide-area detection and assessment system for use in unconstrained exterior security applications. The AES detection and tracking algorithm provides good performance under stressing data and environmental conditions. Features of the algorithm include: reliable detection with negligible false alarm rate of variable velocity targets having low signal-to-clutter ratios; reliable tracking of targets that exhibit motion that is non-inertial, i.e., varies in direction and velocity; automatic adaptation to both infrared and visible imagery with variable quality; and suppression of false alarms caused by sensor flaws and/or cutouts.

23396 (SAND–95-1245C) **A Long-Range Video Observation Post.** Arlowe, D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9506201–1: 11. security technology symposium and exhibitioon, Virginia Beach, VA (United States), 19-22 Jun 1995). Order Number DE95014214. Source: OSTI; NTIS; GPO Dep.

The Long Range Video Observation Post (LRVOP) Project is a cooperative effort between the US and a Middle Eastern country to develop an improved version of their current video observation post. This project is part of a larger effort to cooperatively develop anti-terrorist technology. This particular equipment is required to facilitate the recording and identification of humans at a range of 1000 meters in day-light and 500 meters at night. The project objective was to take advantage of recent advances in camera technology, recorders, and image processing to provide an significant increase in performance with only a minimum increase in size, weight, and cost. The goal of the project was to convert the users general needs and desires into specific requirements that could be bid on by several companies. This paper covers the specific performance requirements, generally describe the components that might be used, and concentrate on describing the more difficult issues and technical challenges.

23397 (SAND–95-1253C) **Intra-site Secure Transport Vehicle test and evaluation.** Scott, S. Sandia National Labs., Albuquerque, NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9506201–3: 11. security technology symposium and exhibitioon, Virginia Beach, VA (United States), 19-22 Jun 1995). Order Number DE95014215. Source: OSTI; NTIS; INIS; GPO Dep.

In the past many DOE and DoD facilities involved in handling nuclear material realized a need to enhance the safety and security for movement of sensitive materials within their facility, or "intra-site". There have been prior efforts to improve on-site transportation; however, there remains a requirement for enhanced on-site transportation at a number of facilities. The requirements for on-site transportation are driven by security, safety, and operational concerns. The Intra-site Secure Transport Vehicle (ISTV) was designed to address these concerns specifically for DOE site applications with a standardized vehicle design. This paper briefly reviews the ISTV design features providing significant enhancement of onsite transportation safety and security, and also describes the test and evaluation activities either complete of underway to validate the vehicle design and operation.

23398 (SAND–95-1273C) **Overview of criminal justice projects at Sandia National Laboratories.** Spencer, D.D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9506201–4: 11. security technology symposium and exhibitioon, Virginia Beach, VA (United States), 19-22 Jun 1995). Order Number DE95014212. Source: OSTI; NTIS; GPO Dep.

The criminal justice projects at SNL include three projects for the National Institute of Justice (smart gun, restraining foam, aqueous foam, corrections perimeter), a Southwest Border study, and one involving corrections agencies. It is concluded that the national technologies developed to protect nuclear and other high value assets have enormous potential for application to crime and personal safety; the difficulty lies in simplifying the technology transfer and making the new systems affordable.

23399 (SAND–95-1441C) **The development of a walk-through portal detector for the identification of contraband explosives.** Parmeter, J.E. (Sandia National Labs., Albuquerque, NM (United States)); Conrad, F.J.; Hannum, D.W.; Linker, K.L.; Lastoskie, C.M. Sandia National Labs., Albuquerque, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9506201–5: 11. security technology symposium and exhibitioon, Virginia Beach, VA (United States), 19-22 Jun 1995). Order Number DE95014858. Source: OSTI; NTIS; GPO Dep.

Recent worldwide events have shown that explosives are the weapon of choice of terrorists in a variety of situations. For this reason, the need exists to develop a walk-through explosives detector that can be used at airports, government buildings, and other sites requiring both high security and the rapid screening of large numbers of people. In this paper, we discuss on-going efforts at Sandia to develop a walk-through explosives detection portal for the Federal Aviation Administration (FAA). We present a brief overview of detectors and detection methods currently utilized in this field, and discuss the special challenges associated with the development of portal detectors. Preliminary results obtained with the portal system at Sandia indicate that the overall portal concept is viable for the detection of contraband high explosives.

23400 (SAND–95-8649C) **Straight-Line: A nuclear material storage information management system.** Nilsen, C.; Mangan, D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9506215–1: 4. NA annual international conference on controlling arms, Philadelphia, PA (United States), 20 Jun 1995). Order Number DE95014352. Source: OSTI; NTIS; INIS; GPO Dep.

Sandia National Laboratories is developing Straight-Line – a pilot system to demonstrate comprehensive monitoring of nuclear material in storage. Straight-Line is an integrated system of sensors providing information that will enhance the safety, security, and international accountability of stored nuclear material. The goals of this effort are to: (1) Provide the right sensor information to the right user immediately. (2) Reduce the expenses, risks, and frequency of human inspection of the material. (3) Provide trustworthy data to international inspectors to minimize their need to make on

site inspections. In pursuit of these goals, Straight-Line unites technology from Sandia's Authenticated Item Monitoring System (AIMS) and other programs to communicate the authenticated status of the monitored item back to central magazine receivers. Straight-Line, however, incorporates several important features not found in previous systems: (1) Information Security – the ability to collect and safely disseminate both classified and unclassified sensor data to users on a need-to-know basis. (2) Integrate into a single system the monitoring needs of safety, security, and international accountability. (3) Incorporate the use of sensors providing analog or digital output. This paper will present the overall architecture and status of the Straight-Line project.

23401 (UCRL-ID–106454-94-4) **Lawrence Livermore National Laboratory safeguards and security quarterly progress report to the US Department of Energy quarter ending September 30, 1994.** Davis, G.; Mansur, D.L.; Ruhter, W.D.; Steele, E.; Strait, R.S. Lawrence Livermore National Lab., CA (United States). Oct 1994. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95012472. Source: OSTI; NTIS; GPO Dep.

This report presents the details of the Lawrence Livermore National Laboratory safeguards and securities program. This program is focused on developing new technology, such as x- and gamma-ray spectrometry, for measurement of special nuclear materials. This program supports the Office of Safeguards and Securities in the following five areas; safeguards technology, safeguards and decision support, computer security, automated physical security, and automated visitor access control systems.

23402 (UCRL-ID–121006) **DISSS/PSDB - Personnel Security Database Modernization Project: Compilation of data gathered from DOE Operations Office's site visits.** Carpenter, R.; Sweeney, D. Lawrence Livermore National Lab., CA (United States). 15 Mar 1995. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015952. Source: OSTI; NTIS; GPO Dep.

This document is a compilation of the information gathered from visits to the DOE Operations Offices. The purpose of these visits was to gather requirements for the modernization of the personnel security database. The initial phase of visits were to sites which had known local systems to augment CPCI. They were; Rocky Flats, Richland, Las Vegas, Savannah River, Oak Ridge, and Oakland. The second phase of site visits were to; Headquarters, Schenectady, Pittsburgh, Idaho Falls, Chicago, and Albuquerque. We also visited the NRC. At each site we reviewed the current clearance process in use at the field office. If the site had a local personnel security database (PSDB), we also reviewed the current PSDB processing. Each meeting was began with the a discussion on the purpose of the meeting and the background of the redesign effort.

23403 (UCRL-JC–120593) **Regulatory issues for deep borehole plutonium disposition.** Halsey, W.G. Lawrence Livermore National Lab., CA (United States). Mar 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9503166–1: Fluor Daniel at Lawrence Livermore National Laboratory, Livermore, CA (United States), 29 Mar 1995). Order Number DE95014161. Source: OSTI; NTIS; INIS; GPO Dep.

As a result of recent changes throughout the world, a substantial inventory of excess separated plutonium is expected to result from dismantlement of US nuclear weapons. The safe and secure management and eventual disposition of this plutonium, and of a similar inventory in Russia, is a high priority. A variety of options (both interim and permanent) are under consideration to manage this material. The permanent solutions can be categorized into two broad groups: direct disposal and utilization. The deep borehole disposition concept involves placing excess plutonium deep into old stable rock formations with little free water present. Issues of concern include the regulatory, statutory and policy status of such a facility, the availability of sites with desirable characteristics and the technologies required for drilling deep holes, characterizing them, emplacing excess plutonium and sealing the holes. This white paper discusses the regulatory issues. Regulatory issues concerning construction, operation and decommissioning of the surface facility do not appear to be controversial, with existing regulations providing adequate coverage. It is in the areas of siting, licensing and long term environmental protection that current regulations may be inappropriate. This is because many current regulations are by intent or by default specific to waste forms, facilities or missions significantly different from deep borehole disposition of excess weapons usable fissile material. It is expected that custom regulations can be evolved in the context of this mission.

23404 (WR-B–95-07) **Consultant subcontracting at the Idaho National Engineering Laboratory.** USDOE Office of Inspector General, Albuquerque, NM (United States). Western Regional Audit Office. 20 Jun 1995. 21p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge).

The Department of Energy (Department), Idaho Operations Office (ID) is responsible for ensuring that its management and operating (M&O) contractors subcontract consultant services in a manner most advantageous to the Department. The objectives of the audit were to determine whether consultant subcontracts were competitively and objectively awarded and whether these subcontracts supported the Idaho National Engineering Laboratory's (INEL) mission. The audit showed that M&O contractors generally did not award consultant subcontracts competitively and objectively. Also, many of the subcontracts were awarded to former INEL employees, increasing the potential for conflicts of interest. These problems occurred because M&O contractors' internal controls did not ensure that sole source procurements were adequately justified and that potential conflicts of interest were avoided. By not competing consultant subcontracts the Department may not have obtained the most economical consultant services. Further, the fundamental fairness upon which such subcontracts were awarded to former employees was questionable. Additionally, one INEL M&O contractor was subcontracting consultant support services directly for Department Headquarters. This occurred because Headquarters elements and the M&O contractor did not follow Department guidance prohibiting subcontractual support from an M&O contractor directly to Headquarters. As a result, the M&O contractor acted as a procurement agent for Headquarters enabling Headquarters to avoid the more stringent requirements of the Department's procurement process.

23406 (ANL/TD/CP–85177) **Versatile neutron NDA.** DeVolpi, A. Argonne National Lab., IL (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract

W-31109-ENG-38. (CONF-950787–5: 36. annual meeting of the Institute for Nuclear Materials Management, Palm Desert, CA (United States), 9-12 Jul 1995). Order Number DE95014225. Source: OSTI; NTIS; INIS; GPO Dep.

Non-destructive analysis (NDA) of bulk samples is a major tool in international safeguards and domestic MC&A. Yet, enhancements are needed to reduce inspection time, financial cost, and radiation exposure-while improving reliability and accuracy-particularly for mixtures of fissile and fertile isotopes. Perhaps the greatest remaining direction for NDA improvement is the development of a single controllable neutron source that would add versatility and capability. One of the primary prospects is a switchable radioactive neutron source (SRNS) that has been under advanced-concept development at Argonne with DOE funding. The SRNS would be in a sealed capsule that can be remotely switched on and off, or pulsed at a controllable rate. Li(α, n) or Be(α, n) reactions could give a choice of sub-threshold or hard-spectrum neutrons at yields ranging from 10^4/s to more than 10^8s. The SRNS would provide improved capabilities for (1) simultaneous or alternating interrogation with fast and slow neutrons, (2) detection of the first few seconds of delayed neutrons, (3) measurements in the presence of high neutron and/or gamma background, and (4) inspection of heterogeneous materials. When the neutrons are switched off, the source would be portable with vastly reduced shielding. Proof-of-concept with a single switchable plate has been established under laboratory conditions.

23407 (JAERI-Tech–95-013) **Pilot-scale test for electron beam flue gas treatment of coal-fired boiler.** Namba, Hideki (Japan Atomic Energy Research Inst., Takasaki, Gunma (Japan). Takasaki Radiation Chemistry Research Establishment); Tokunaga, Okihiro; Hashimoto, Shoji; Tanaka, Tadashi; Ogura, Yoshimi; Doi, Yoshitaka; Aoki, Shinji; Izutsu, Masahiro. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 13p. (In Japanese). Order Number DE95789344. Source: OSTI; NTIS; INIS.

The report summarizes the results of pilot-scale test conducted from November 1992 to December 1993 in the premises of Shin-Nagoya Power Plant of Chubu Electric Power Company to establish the technology to remove SO_2 and NO_X simultaneously in dry process by electron-beam irradiation. The results are summarized as follows. (1) SO_2 and NO_X removal efficiency; The tests were conducted to prove enough SO_2 and NO_X removals for wide concentration range (SO_2 : 250-2,000ppmv, NO_X : 140-240ppmv) under the flue gas condition of O_2 10-11% in dry base and H_2O 5-6% in wet base. The electron beam method achieved higher removal performance than the target (SO_2 removal : 94%, NO_X removal : 80%) under all flue gas conditions sited above, with properly controlled absorbed dose, flue gas temperature and amount of ammonia injection. (2) Byproduct collection; More than 99% of particulate was collected by the electrostatic precipitator (ESP) with optimizing charge current and rapping cycle of ESP. Particulate concentration at the outlet of the bag filter installed downstream of ESP was as low as 0.1-0.4mg/m^{3}N. It is expected that particulate concentration at ESP outlet could be reduced to the level of 5mg/m^{3}N with increased collecting plate-area of ESP even without bag filter. (3) Controllability and reliability of equipment; The performance, controllability, reliability, and durability of the system were confirmed through the test operation using the same flue gas cooling system, electron beam voltage, structure and cooling system of window foils as those of actual scale plant. (4) Quality of byproduct; It was proved that the byproduct had excellent quality as same as that of nitrogenous fertilizers on market with the result of chemical analysis and plant growth test. The byproduct was officially registered as an agricultural fertilizer under the Fertilizer Control Act in Japan. (author).

23408 (ORNL/M–3774) **Assessment of the roles of the Advanced Neutron Source Operators.** Hill, W.E.; Houser, M.M.; Knee, H.E.; Spelt, P.F. Oak Ridge National Lab., TN (United States). Mar 1995. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95012535. Source: OSTI; NTIS; INIS; GPO Dep.

The Advanced Neutron Source (ANS) is unique in the extent to which human factors engineering (HFE) principles are being applied at the conceptual design stage. initial HFE accomplishments include the development of an ANS HFE program plan, operating philosophy, and functional analysis. In FY 1994, HFE activities focused on the role of the ANS control room reactor operator (RO). An operator-centered control room model was used in conjunction with information gathered from existing ANS system design descriptions and other literature to define a list of RO responsibilities. From this list, a survey instrument was developed and administered to ANS design engineers, operations management personnel at Oak Ridge National Laboratory's High Flux Isotope Reactor (HFIR), and HFIR ROs to detail the nature of the RO position. Initial results indicated that the RO will function as a high-level system supervisor with considerable monitoring, verification, and communication responsibilities. The relatively high level of control automation has resulted in a reshaping of the RO's traditional safety and investment protection roles.

23409 (NUREG–0090-Vol.18-No.1) **Report to Congress on abnormal occurrences, January–March 1995. Volume 18, No. 1.** Nuclear Regulatory Commission, Washington, DC (United States). Office for Analysis and Evaluation of Operational Data. Jul 1995. 21p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

Section 208 of the Energy Reorganization Act of 1974 identifies an abnormal occurrence (AO) as an unscheduled incident or event that the Nuclear Regulatory Commission determines to be significant from the standpoint of public health or safety and requires a quarterly report of such occurrences to be made to Congress. This report provides a description of those incidents and events that have been determined to be AOs during the period of January 1 through March 31, 1995. This report addresses one AO at an NRC-licensed facility which involved a medical brachytherapy misadministration. The report also contains updates of one AO previously reported by an NRC licensee and three AOs previously reported by the Agreement States. No "Other Events of Interest" items are being reported.

23410 (ORNL/ER–230) **Project management plan for the Isotopes Facilities Deactivation Project at Oak Ridge National Laboratory. Environmental Restoration Program.** Oak Ridge National Lab., TN (United States). [1995]. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95008963. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the Isotopes Facilities Deactivation Project (IFDP) is to place nineteen former isotopes production facilities at the Oak Ridge National Laboratory in a safe, stable, and environmentally sound condition suitable for an extended period of minimum surveillance and maintenance (S&M) and as quickly and economically as possible. Implementation and completion of the deactivation project win further reduce the already small risks to the environment and to public safety and health. Furthermore, the project should result in significant S&M cost savings in the future. The IFDP management plan has been prepared to document the project objectives, define organizational relationships and responsibilities, and outline the management control systems to be employed in the management of the project. The project has adopted a strategy to deactivate the simple facilities first, to reduce the scope of the project, and to gain experience before addressing more difficult facilities. A decision support system is being developed to identify those activities that best promote the project mission and result in largest cost savings. The Work Plan for the Isotopes Facilities Deactivation Project at Oak Ridge National Laboratory (Energy Systems 1994) defines the project schedule, the cost estimate, and the technical approach for the project.

23411 (PNL–10620) **Tritium radioluminescent devices, Health and Safety Manual.** Traub, R.J.; Jensen, G.A. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 133p. The 1995 progress report of the Secretary of Energy's Hydrogen Technical Advisory Panel.** National Renewable Energy Lab., Golden, CO (United States). [1995]. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95009213. Source: OSTI; NTIS; GPO Dep.

This report presents the idea that hydrogen and electricity, ultimately derived from renewable technologies, will serve as the clean, inexhaustible energy carriers in the next century. The widespread introduction of these energy forms would dramatically reduce the nation's air pollution, enhance its energy security, and ameliorate potential global climate problems. The topics of the report include the role of hydrogen, research priorities, and use of hydrogen in surface transportation and aircraft.

We have significantly increased our computational modeling capability by the addition of a vertical valve model in KIVA-3, code used internationally for engine design. In this report the implementation and application of the valve model is described. The model is shown to reproduce the experimentally verified intake flow problem examined by Hessel. Furthermore, the sensitivity and performance of the model is examined for the geometry and conditions of the hydrogen-fueled Onan engine in development at Sandia National Laboratory. Overall the valve model is shown to have comparable accuracy as the general flow simulation capability in KIVA-3, which has been well validated by past comparisons to experiments. In the exploratory simulations of the Onan engine, the standard use of the single kinetic reaction for hydrogen oxidation was found to be inadequate for modeling the hydrogen combustion because of its inability to describe both the observed laminar flame speed and the absence of autoignition in the Onan engine. We propose a temporary solution that inhibits the autoignition without sacrificing the ability to model spark ignition. In the absence of experimental data on the Onan engine, a computational investigation was undertaken to evaluate the importance of modeling the intake flow on the combustion and NO_x emissions. A simulation that began with the compression of a quiescent hydrogen-air mixture was compared to a simulation of the full induction process with resolved opening and closing of the intake valve. Although minor differences were observed in the cylinder-averaged pressure, temperature, bulk-flow kinetic energy and turbulent kinetic energy, large differences where observed in the hydrogen combustion rate and NO_x emissions. The flow state at combustion is highly heterogeneous and sensitive to the details of the bulk and turbulent flow and that an accurate simulation of the Onan engine must include the modeling of the air-fuel induction.

23416 (UCRL-JC–120677) **Detailed and global chemical kinetics model for hydrogen.** Marinov, N.M.; Westbrook, C.K.; Pitz, W.J. Lawrence Livermore National Lab., CA (United States). Mar 1995. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9510158–1: 8. international symposium on transport properties, San Francisco, CA (United States), Oct 1995). Order Number DE95013439. Source: OSTI; NTIS; GPO Dep.

Detailed and global chemical kinetic computations for hydrogen-air mixtures have been performed to describe flame propagation, flame structure and ignition phenomena. Simulations of laminar flame speeds, flame compositions and shock tube ignition delay times have been successfully performed. Sensitivity analysis was applied to determine the governing rate-controlling reactions for the experimental data sets examined. In the flame propagation and structure studies, the reactions, $OH + H_2 = H_20 + H$, $0 + H_2 = OH + H$ and $0 + OH = 0_2 + H$ were the most important in flames. The shock tube ignition delay time study indicated the $H + 0_2 + M = H0_2 + M$ ($M = N_2, H_2$) and $0 + OH = 0_2 + H$ reactions controlled ignition. A global rate expression for a one-step overall reaction was developed and validated against experimental hydrogen-air laminar flame speed data. The global reaction expression was determined to be $1.8 \times 10^{13} \exp(-17614K/T)[H_2]^{1.0}[O_2]^{0.5}$ for the single step reaction $H_2 + 1/2O_2 = H_2O$.

The operation of the patented hardware/software Field Grid Sense (FGS) system is being tested in crop harvesting in order to demonstrate the systems's utility and to analyze the flexibility of operation under true field conditions. FGS is also being used with

chemical application equipment. This action will create improved systems and establish the worthiness, efficiency and necessity of chemical application equipment that is controlled and directed via the FGS package.

23418 (DOE/ER/14059–T1) **Hemicellulases from anaerobic thermophiles. Progress report.** Wiegel, J. Georgia Univ., Athens, GA (United States). Research Foundation. May 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-89ER14059. Order Number DE95015475. Source: OSTI; NTIS; GPO Dep.

The longterm goal of this research effort is to obtain an anaerobic thermophilic bacterium that efficiently converts various hemicellulose-containing biomass to ethanol over a broad pH range. The strategy is to modify the outfit and regulation of the rate-limiting xylanases, glycosidases and xylan esterases in the ethanologenic, anaerobic thermophile Thermoanaerobacter ethanolicus, which grows between pH 4.5 and 9.5. Although it utilizes xylans, the xylanase, acetyl(xylan) esterase and O-methylglucuronidase activities in T. ethanolicus are barely measurable and regarded as the rate limiting steps in its xylan utilization. Thus, and also due to the presently limited knowledge of hemicellulases in anaerobic thermophiles, we characterize the hemicellulolytic enzymes from this and other anaerobic thermophiles as enzyme donors. Beside the active xylosidase/arabinosidase from T. ethanolicus, exhibiting the two different activities, we characterized 2 xylosidases, two acetyl(xylan) esterases, and an O-methylglucuronidase from Thermoanaerobacterium spec. We will continue with the characterization of xylanases from novel isolated slightly acidophilic, neutrophilic and slightly alkalophilic thermophiles. We have cloned, subcloned and partially sequenced the 165,000 Da (2 x 85,000) xylosidase/arabinosidase from T. ethanolicus and started with the cloning of the esterases from Thermoanaerobacterium spec. Consequently, we will develop a shuttle vector and continue to apply electroporation of autoplasts as a method for cloning into T. ethanolicus.

Source: OSTI; NTIS; GPO Dep.

The authors are continuing their efforts to partly dissociate the cellulolytic enzyme complex of C. thermocellum. This complex named cellulosome (also existing as polycellulosome) consists of perhaps as many as 26 different subunits. It is extremely resistant to dissociation and denaturation. Treatments with urea and SDS have little effect unless the latter treatment is at high temperature. Significantly, some of the subunits after SDS dissociation have CMCase (endoglucanase) activity but no activity toward crystalline cellulose. The only reported success of hydrolysis of crystalline cellulose by cellulosomal subunits is by Wu et al. who isolated two protein fractions labeled SL and SS which when combined exhibit a low (about 1% of the original cellulosome) activity toward crystalline cellulose. The long standing goal is still to determine the activities of the individual subunits, to characterize them, to find out how they are associated in the cellulosome, and to establish the minimum number of subunits needed for efficient hydrolysis of crystalline cellulose. This report also presents the results of experiments on cellulose hydrolysis in aerobic fungi, as well as other anaerobic bacteria.

23421 (DOE/ER/13712–4) **Molecular genetics of ligninase expression. Progress report.** Cullen, D. (Univ. of Wisconsin, Madison, WI (United States). Dept. of Bacteriology). Wisconsin Univ., Madison, WI (United States). Dept. of Plant Pathology. [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER13712. Order Number DE95013811. Source: OSTI; NTIS; GPO Dep.

The objectives of this research for the past three years have been to (1) elucidate the structure and genomic organization of genes involved in lignin degradation; and (2) investigate the expression of these genes in Phanerochaete chrysosporium and in heterologous hosts. Major accomplishments include the following: (1) the P. chrysosporium gene encoding glyoxal oxidase has been cloned, sequenced, and efficiently expressed in Aspergillus; (2) mapping methods were developed allowing the integration of genetic and physical maps of P. chrysosporium; (3) highly specific and sensitive PCR techniques were developed for discriminating closely related mRNAs. Application of this technique will help to identify specific genes involved in degradation of lignin and organopollutants; (4) investigations have revealed a novel insertional mutation in lignin peroxidase gene lipI.

23422 (DOE/ER/14059–2) **The hemicellulases from the ethanologenic thermophile, Thermoanaerobacter ethanolicus and similar anaerobic thermophiles. Annual technical progress report.** Wiegel, J. Georgia Univ., Athens, GA (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-89ER14059. Order Number DE95014706. Source: OSTI; NTIS; GPO Dep.

A Xylanase was fractionated from Thermoanaerobacter ethanolicus, an ethanologenic thermophile, and the preparation so obtained was used to determined enzymatic parameters such as pH profile of enzyme activity. The ability of various mono- and di-saccharides as well as temperature variations to induce this enzyme activity were studied.

23423 (DOE/R4/10591–1) **Intermediate-scale high-solids anaerobic digestion system operational development.** Rivard, C.J. National Renewable Energy Lab., Golden, CO (United States). Feb 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG44-91R410591. Order Number DE95009646. Source: OSTI; NTIS; GPO Dep.

Anaerobic bioconversion of solid organic wastes represents a disposal option in which two useful products may be produced, including a medium Btu fuel gas (biogas) and a compost-quality organic residue. The application of high-solids technology may offer several advantages over conventional low-solids digester technology. Operation of the anaerobic digestion process at high solids reduces the level of process water and thereby the size and capital costs for the digester system. In addition, by virtue of the lack of available water, the microbial catalysts are more productive in feedstock polymer hydrolysis. The National Renewable Energy Laboratory (NREL) has developed a unique digester system capable of uniformly mixing high-solids materials at low cost. Information gained from laboratory-scale digester research was used to develop die intermediate-scale digester system. This system represents a 50-fold scale-up of the original digester system and includes continuous feed addition and computer monitoring and control. During the first 1.15 years of operation, a variety of modifications and improvements were instituted to increase the safety, reliability, and performance of the system. Those improvements – which may be critical in further scale-up efforts using the NREL high-solids digester design – are detailed in this report.

23424 (ETDE-DE–155) **Power generation from biomass. Agricultural, technical and economic aspects.** Akademie fuer

Technikfolgenabschaetzung in Baden-Wuerttemberg. Arbeitsberichte, v. 43. Flaig, H.; Lueneburg, E. von; Ortmaier, E.; Seeger, C. Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg, Stuttgart (Germany). Feb 1995. 140p. (In German). Order Number DE95790380. Source: OSTI; NTIS (US Sales Only).

The report discusses power generation from biomass. Plants for wood and straw combustion are described under the aspect of environmental protection. The environmental impact of power generation from biomass is discussed as well as economic and logistic aspects. (orig.)

23425 (ETDE-DE–156) **Climate-compatible power supply in Baden-Wuerttemberg - energy from agricultural and forestry biomass.** Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg. Arbeitsberichte, v. 16. Flaig, H. (Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg, Stuttgart (Germany). Bereich Biotechnologie, Oekologie, Gesundheit); Linckh, G.; Mohr, H. Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg, Stuttgart (Germany). Feb 1995. 89p. (In German). Order Number DE95790252. Source: OSTI; NTIS (US Sales Only).

The report investigates the use of solid fuels such as straw and wood and of rapeseed oil and biogas for power generation. In each case, it presents the state of the art, the technological potentiall, the cost of installing plants of this type, and the impact on the environment (carbon dioxide emission), society, and agriculture. (SR)

23426 (NREL/TP–431-7971) **Progress in the production of hot-gas filtered biocrude oil at NREL.** Diebold, J.P.; Scahill, J.W.; Czernik, S.; Phillips, S.D.; Feik, C.J. National Renewable Energy Lab., Golden, CO (United States). May 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95009245. Source: OSTI; NTIS; GPO Dep.

Progress in the production of hot-gas filtered biocrude oils from a dry hybrid poplar feedstock in the NREL vortex ablative pyrolysis reactor is discussed. In particular, adjusting the pyrolysis severity in the vortex reactor and the cracking severity in the char baghouse resulted in increased oil yields of very low-ash and low-alkali biocrude oils. The viscosity of these oils meets the requirements for American Society for Testing and Materials (ASTM) No.4 fuel oils. Increasing the water content to 30% decreased the viscosity by half, but not enough to meet the viscosity requirement for ASTM No.2 fuel oil. Viscosity contours for water and methanol dilution are shown. The addition of water or methanol or both to make a more consistent product may be advantageous. Aging studies of this low-alkali oil showed a slower increase in viscosity with time equal to one-third the rate of a biocrude oil with higher alkali contents. It appears that removal of the char fines results in a more stable oil. In fact, after 24 hours at 90 C, the viscosity of this low-ash biocrude oil was lower than that seen previously for the unaged sample of higher ash oil. It is concluded that the removal of char fines to produce a premium biocrude oil will be even more important than was previously supposed.

23427 (NYSERDA–95-9) **Integrated process for microbial solvent production from whey permeate. Final report.** New York State Energy Research and Development Authority, Albany, NY (United States); Cornell Univ., Ithaca, NY (United States). Dept. of Agricultural and Biological Engineering. Jun 1995. 45p. Sponsored by New York State Energy Research and Development Authority, Albany, NY (United States). Source: OSTI; New York State Energy Research and Development Authority, Two Rockefeller Plaza, Albany, NY 12223 (United States).

Acetone and butanol were historically produced through fermentation of carbohydrate raw materials. Conventional feedstocks such as grain and molasses, and the energy required to recover products by distillation, are too costly for traditional batch fermentation to compete with petrochemical synthesis. The authors proposed to evaluate an acetone-butanol-ethanol fermentation of acid whey permeate, a cheap carbohydrate source, using up-to-date bioreactor technology continuous fermentation with cell recycle and in-situ butanol recovery by gas stripping. Clostridium acetobutylicum P262 was the strain chosen, as it assimilates both the lactose and lactic acid in acid whey. Single-stage continuous culture proved unsuitable for butanol production, since productivity is low and cultures degenerated quickly. Two-stage culture improved productivity by a factor of two over batch runs. All continuous cultures showed major oscillations in cell density, substrate concentration and products formed. Under these conditions, cell recycle did not affect productivity in two-stage culture. Gas stripping with fermentor off-gases recovered a clean condensate of butanol and acetone at 70–90% yield and with purification factors of 14 to 35. Stripping maintained solvent concentrations in the range of 2–4 g/l even at the peak of solventogenesis, eliminating product inhibition. Gas stripping produced a 50% improvement in substrate uptake and a 10–20% improvement in solvent productivity.

0910 Properties and Composition

23428 (NREL/TP–433-7965) **An atlas of thermal data for biomass and other fuels.** Gaur, S. (Colorado School of Mines, Golden, CO (United States)); Reed, T.B. National Renewable Energy Lab., Golden, CO (United States). Jun 1995. 189p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95009212. Source: OSTI; NTIS; GPO Dep.

Biomass is recognized as a major source of renewable energy. In order to convert biomass energy to more useful forms, it is necessary to have accurate scientific data on the thermal properties of biomass. This Atlas has been written to supply a uniform source of that information. In the last few decades Thermal analysis (TA) tools such as thermogravimetry, differential thermal analysis, thermo mechanical analysis, etc. have become more important. The data obtained from these techniques can provide useful information in terms of reaction mechanism, kinetic parameters, thermal stability, phase transformation, heat of reaction, etc. for gas-solid and gas-liquid systems. Unfortunately, there are no ASTM standards set for the collection of these types of data using TA techniques and therefore, different investigators use different conditions which suit their requirements for measuring this thermal data. As a result, the information obtained from different laboratories is not comparable. This Atlas provides the ability to compare new laboratory results with a wide variety of related data available in the literature and helps ensure consistency in using these data.

23429 (PNL-SA–24295) **Chemical analysis of biomass fast pyrolysis oils.** Elliott, D.C. Pacific Northwest Lab., Richland, WA (United States). Sep 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9409224–2: Biomass pyrolysis oil properties and combustion meeting, Estes Park, CO (United States), 26-28 Sep 1994). Order Number DE95014616. Source: OSTI; NTIS; GPO Dep.

This paper reviews the development of the field of chemical analysis of biomass fast pyrolysis oils. The techniques applied to pyrolysis oil analysis are reviewed including proximate and ultimate analysis, water (moisture) analysis, and chemical component analysis by various forms of chromatography, solvent separations, and spectrophotometric analyses, like infrared and ultraviolet. Advanced analytical techniques such as nuclear magnetic resonance and molecular beam – mass spectrometry are also discussed. This paper reviews and compares the methods and the results of the analyses. The advantages and shortcomings of the various methods applied are identified. Comparisons derived from the IEA Round Robin are incorporated.

0930 Economic, Industrial, and Business Aspects

23430 (CONF-9410357–1) **Production costs and supply of biomass by U.S. Region.** Walsh, M. Oak Ridge National Lab., TN (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Iowa's pursuit of energy efficiency conference; Des Moines, IA (United States); 25-26 Oct 1994. Order Number DE95013985. Source: OSTI; NTIS; GPO Dep.

The Biofuels Feedstock Development Program has attempted to estimate the cost of producing dedicated energy crops for several regions of the United States. Switchgrass and hybrid poplar have been chosen as representative herbaceous and woody crop species for the estimation. A full economic cost accounting approach is used. This means that not only are out-of-pocket cash

expenses (e.g. fertilizers, chemicals, seeds, fuel, repairs) estimated, but fixed costs (e.g., overhead, taxes) and the costs of owned resources (e.g., producer's own labor, equipment depreciation, land values) are also estimated as part of the cost of producing dedicated energy crops. The costs are estimated as enterprise budgets which means that costs of producing energy crops are estimated as separate entities, and not estimated in context of the entire farm management structure. Competitiveness of energy crops with conventional crops vary by region. Breakeven prices are regional averages. Breakeven prices for poplar are higher than for switchgrass in all regions, in large part due to the higher cost of producing poplars.

23431 (ORNL–6858) **Potential supply and cost of biomass from energy crops in the TVA region.** Graham, R.L.; Downing, M.E. Oak Ridge National Lab., TN (United States). Apr 1995. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95011623. Source: OSTI; NTIS; GPO Dep.

The economic and supply structures of energy crop markets have not been established. Establishing the likely price and supply of energy crop biomass in a region is a complex task because biomass is not an established commodity as are oil, natural gas, and coal. In this study, the cost and supply of short-rotation woody crop (SRWC) and switchgrass biomass for the Tennessee Valley Authority (TVA) region-a 276-county area that includes portions of 11 states in the southeastern United States - are projected. Projected prices and quantities of biomass are assumed to be a function of the amount and quality of crop and pasture land available in a region, expected energy crop yields and production costs on differing soils and land types, and the profit that could be obtained from current conventional crop production on these same lands. Results include the supply curves of SRWC and switchgrass biomass that are projected to be available from the entire region, the amount and location of crop and pasture land that would be used, and the conventional agricultural crops that would be displaced as a function of energy crop production. Finally, the results of sensitivity analysis on the projected cost and supply of energy crop biomass are shown. In particular, the separate impacts of varying energy crop production costs and yields, and interest rates are examined.

23432 (ETDE/JP-mf–95790778) **Report of the fiscal 1993 liquid fuel conversion technology development. Development for Practical application of a new production process.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1994. 165p. (In Japanese). Order Number DE95790778. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

The development for practical application of a new production process is made to reduce cost of fuel-use methanol. In the new vapor-phase fluidized bed method, used is a heat exchange type combined reforming furnace where steam reforming and partial oxidation are integrated into one tower in production of synthesis gas (CO, CO2, H2) from natural gas. Part of natural gas is reacted with the oxygen supplied, and using the reaction heat, the remaining natural gas is reformed. For methanol synthesis, a vapor-phase fluidized bed reactor is developed, catalyst particles are fluidized, and reaction heat is recovered as high-temperature steam. In the new production process, increase in plant size and efficiency can be made, and various combinations can be made of the reforming method and the methanol synthesis method. The new production process brings reduction in construction cost, improvement in energy unit requirement, and energy saving. In fiscal 1993, study was made on fluidized bed catalyst, unit process and its optimization, etc. Further, conceptual design was made on high efficiency which is more than 90% in single pass conversion ratio to methanol at 150°C and under less than 30 atm, and an economical low-temperature liquid phase method. 7 refs., 94 figs., 22 tabs.

23433 (DOE/MC/29228–4070) **Selective methane oxidation over promoted oxide catalysts. Quarterly report, December 1994–February 1995.** Klier, K.; Herman, R.; Shi, Chunlei; Wang, Chaun-Bao; Sun, Qun. Lehigh Univ., Bethlehem, PA (United States). Mar 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG21-92MC29228. Order Number DE95009716. Source: OSTI; NTIS; GPO Dep.

The objective of this research is the selective oxidative coupling of methane to C_2 hydrocarbons and oxygenates, in particular formaldehyde and methanol. Air, oxygen, or carbon dioxide, rather than nitrous oxide will be utilized as the oxidizing gas at high gas hourly space velocity, but mild reaction conditions (500–700°C, 1 atm total pressure). All the investigated processes are catalytic, aiming at minimizing gas phase reactions that are difficult to control. In order to optimize oxygenate space time yields over supported vanadium catalysts, testing of catalysts with various vanadium contents was carried out during this quarter. The highest oxygenate productivity from CH_4/air/steam reactants that has been observed so far was achieved with the 2.0 wt % catalyst. The effects of steam on activity and selectivity were explored in more detail over a 2 wt % V_2O_5/SiO_2 catalyst prepared by impregnation of a methanol solution of vanadium(V) triisopropoxide oxide and amorphous silica. An interesting observation was that the HCHO space time yields were not significantly affected by increasing steam in the feed while those of methanol were, which indicated that the two oxygenates may be formed by separate pathways on the surface. Experiments were carried out in which the 1 wt % $SO_4^{2-}/Sr/La_2O_3$ and 1 wt % V_2O_5/SiO_2 catalysts were physically mixed (mixed bed) instead of one lying on top of the other (double bed). With the mixed bed, the total oxygenate space time yields decreased and the HCHO space time yields dropped to virtually zero. However, the space time yields of methanol were still significant.

23434 (DOE/MC/60249–95/C0486) **The synthesis and characterization of new iron coordination complexes utilizing an asymmetric coordinating chelate ligand.** Watkins, B.E.; Satcher, J.H. Lawrence Livermore National Lab., CA (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950494–31: Natural gas research, development and demonstration contractors review meeting, Baton Rouge, LA (United States), 4-6 Apr 1995). Order Number DE95015004. Source: OSTI; NTIS; GPO Dep.

A binuclear, unsymmetric coordinating ligand that is an effective metal chelator has been designed and synthesized. The new ligand has been shown to react readily with iron(II)/(III) forming a variety of coordination complexes. The binuclear complexes are of significant interest since they represent proof-of-principle for the development of coordinatively asymmetric, binuclear metal chelate compounds. Although this structural type of chelator now appears to be common in biological systems, it has not been previously described for inorganic coordination chemistry. The isolation of oxidation products will be helpful in establishing reaction mechanism(s) of these complexes with molecular oxygen. It is expected that this ligand and derivatives of it will play an important role in the development of bioinorganic complexes that aim to mimic enzyme active sites that function by substrate interaction at only one metal site of a multimetal active site.

23435 (DOE/PC/90011–T1) **Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 1, October 16, 1986–January 15, 1987.** Wilson, R.B. Jr.; Chan, Yee Wai. SRI International, Menlo Park, CA (United States). 23 Feb 1987. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-86PC90011. Order Number DE95014801. Source: OSTI; NTIS; GPO Dep.

The United States will need to be able to convert coal to liquid fuels should current supplies be interrupted. The indirect method for producing fuel liquids is the gasification of the coal to synthesis gas (syngas) followed by Fischer-Tropsch synthesis to convert syngas to hydrocarbons. However, both the gasifier and the FTS processes result in the production of methane and/or light hydrocarbon by-product that negatively affect the economics of the

production of liquid fuel from coal. The goal of SRI's research is thus to develop catalysts that directly convert methane and light hydrocarbons to intermediates that can, as economics dictate, be subsequently converted either to liquid fuels or value-added chemicals. SRI project 2678 is exploring two approaches to achieving the stated goal. The first approach consists of developing advanced catalysts for reforming methane. We will prepare the catalysts by reacting organometallic complexes of transition metals (Fe, Ru, Rh, and Re) with zeolitic and rare earth exchanged zeolitic supports to produce surfaceconfined metal complexes in the zeolite pores. We will then decompose the organometallic complexes to obtain very stable, highly dispersed catalysts. Our second approach entails synthesizing the porphyrin and phthalocyanine complexes of Cr, Mn, Ru, Fe, and/or Co within the pores of zeolitic supports for use as selective oxidation catalysts for methane and light hydrocarbons. We will test the catalysts in a fixed-bed isothermal microreactor in a downflow mode at ~100 psi. During the first quarter of this project, we have concentrated on methane oxidation to methanol. We have synthesized phthalocyanine oxidation catalysts containing different metals (Co, Fe, and Ru) within zeolite pores. our examination of their ability to oxidize methane to methanol has indicated preliminary positive results.

23436 (DOE/PC/90011–T2) **Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 2, January 16, 1987–April 15, 1987.** Wilson, R.B. Jr.; Chan, Yee Wai. SRI International, Menlo Park, CA (United States). 21 May 1987. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-86PC90011. Order Number DE95014802. Source: OSTI; NTIS; GPO Dep.

The goal of this research is to develop catalysts that directly convert methane and light hydrocarbons to intermediates that can, as economics dictate, be subsequently converted either to liquid fuels or value-added chemicals. In this program we are exploring two approaches to developing such catalysts. The first approach consists of developing advanced catalysts for reforming methane. We will prepare the catalysts by reacting organometallic complexes of transition metals (Fe, Ru, Rh, and Re) with zeolitic and rare-earth-exchanged zeolitic supports to produce surfaceconfined metal complexes in the zeolite pores. Our second approach entails synthesizing the porphyrin and phthalocyanine complexes of Cr, Mn, Ru, Fe, and/or Co within the pores of zeolitic supports for use as selective oxidation catalysts for methane and light hydrocarbons. During the second quarter of this project, we concentrated on methane reforming. Two ruthenium clusters (Ru_4 and Ru_6) supported on three types of support materials (β-alumina, 5 Å molecular sieves, and γ-zeolite) were tested for methane reforming. The effects of cluster size, supporting material, and reaction conditions were evaluated. The methane conversions range from 1.74 to 10.11% at 750°C. The reaction product contains hydrogen, C_2 hydrocarbons, and C_6 or higher hydrocarbons. Up to 48.34% yield of hydrocarbon (C_2+) is obtained based on reacted methane. Some of these catalysts show very good coking resistance compared with a commercial ruthenium catalyst. Addition of oxygen to these reactions significantly increases the percent methane conversion at lower reaction temperature. However, carbon dioxide and water are the major products in the presence of oxygen.

23437 (DOE/PC/90011–T3) **Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 3, April 16–July 15, 1987.** Wilson, R.B. Jr.; Chan, Yee Wai. SRI International, Menlo Park, CA (United States). 28 Aug 1987. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-86PC90011. Order Number DE95014803. Source: OSTI; NTIS; GPO Dep.

The goal of this research is to develop catalysts that directly convert methane and light hydrocarbons to intermediates that can, as economics dictate, be subsequently converted either to liquid fuels or value-added chemicals. In this program we are exploring two approaches to developing such catalysts. The first approach consists of developing advanced catalysts for reforming methane. We will prepare the catalysts by reacting organometallic complexes of transition metals (Fe, Ru, Rh, and Re) with zeolitic and rare-earth-exchanged zeolitic supports to produce surface-confined metal complexes in the zeolite pores. Our second approach entails synthesizing the porphyrin and phthalocyanine complexes of Cr, Mn, Ru, Fe, and/or Co within the pores of zeolitic supports for use as selective oxidation catalysts for methane and light hydrocarbons. During this reporting period, we concentrated on synthesizing and testing methane oxidation catalysts using the automated GC sampling system. We modified our preparation method of zeolite-encapsulated phthalocyanines (PC). The catalysts have higher complex loading, and the uncomplexed metal ions were back-exchanged by sodium ions (to remove any uncomplexed metal ions). Four metal ions were used: cobalt, iron, ruthenium, and manganese. We also synthesized four zeolite-encapsulated tetraphenylporphyrin (TPP) complexes using the same metals. These catalysts were tested for methane oxidation in the temperature range from 300° to 500°C at 50 psig pressure. The RUPC, COTPP, and MNTPP showed activity toward the formation of methanol. The RUPC zeolite gave the best methanol yield. The methane conversion was 4.8%, and the selectivity to methanol is 11.3% at 375°C. Again, the major products are carbon dioxide and water in every catalyst we tested during this reporting period.

23438 (DOE/PC/90011–T4) **Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 4, August 16–October 15, 1987.** Wilson, R.B. Jr.; Chan, Yee Wai. SRI International, Menlo Park, CA (United States). 19 Nov 1987. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-86PC90011. Order Number DE95014804. Source: OSTI; NTIS; GPO Dep.

The goals of this research project are to increase the methane conversion and improve the hydrocarbon production. For methane reforming, we achieved a conversion of up to 43% by adjusting the reaction conditions. Ruthenium clusters are effective catalysts but the selectivity to hydrocarbons needs to be improved. In evaluating the effect of cluster size for mononuclear, tetranuclear, and hexanuclear ruthenium complexes we found that the tetraruthenium cluster was by far the most effective catalyst. We began to study the mixed metal catalysts by synthesizing a $FeRu_3$ cluster. We plan to vary the ratio of Fe to Ru by synthesizing Fe_2Ru_2 and Fe_3Ru clusters. The type of the support also plays an important role in methane reforming. We briefly tested a basic support, magnesia, in addition to the acidic supports tested previously (alumina, 5A molecular sieve, and Y-zeolite). The results are promising. We will continue to investigate the role of the support. The effectiveness of using a hydrogen removal membrane is still in question. We purchased a new Pd/Ag membrane tube inside which a stainless steel spring is inserted. The steel spring will increase the strength of the otherwise fragile tube and it will support the tube during bending. We will build a new reactor using this membrane tube.

23439 (DOE/PC/90011–T5) **Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 5, November 16, 1987–January 15, 1988.** Wilson, R.B. Jr.; Chan Yee Wai. SRI International, Menlo Park, CA (United States). 5 Feb 1988. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-86PC90011. Order Number DE95014805. Source: OSTI; NTIS; GPO Dep.

The goal of this research is to develop catalysts that directly convert methane and light hydrocarbons to intermediates that later can be converted to either liquid fuels or value-added chemicals, as economics dictate. During this reporting period, we have synthesized and tested several novel catalysts for methane reforming (Tasks 1 and 2) and for partial oxidation of methane (Tasks 3 and 4). We started to test a mixed metal system, an $FeRu_3$ cluster. This catalyst was supported both on zeolite and on magnesium oxide and the systems were tested for methane reforming at various reaction temperatures. We also prepared and tested a monomeric ruthenium catalyst supported on magnesium oxide. We found that methane is activated at a lower temperature with the basic magnesium oxide support than with acidic supports such as zeolite or alumina. Methane conversions increased with temperature, but the production of coke also increased. We prepared a sterically hindered ruthenium porphyrin encapsulated in a zeolite supercage for catalysis of methane oxidation. The results showed that only carbon dioxide was produced. Addition of axial base to this catalyst gave similar results. Another type of catalyst, cobalt Schiff base complexes, was also prepared and tested for methane oxidation. In

this case, no methane conversion was observed at temperatures ranging from 200 to 450°C. These complexes do not appear to be stable under the reaction conditions.

23440 (DOE/PC/90011–T6) **Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 6, January 16, 1988–April 15, 1988.** Wilson, R.B. Jr.; Chan, Yee Wai; Posin, B.M. SRI International, Menlo Park, CA (United States). 20 May 1988. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-86PC90011. Order Number DE95014806. Source: OSTI; NTIS; GPO Dep.

The goal of this research is to develop catalysts that directly convert methane and light hydrocarbons to intermediates that later can be converted to either liquid fuels or value-added chemicals, as economics dictate. During this reporting period, we synthesized several phthalocyanine catalysts supported on magnesia (MgO) in Task 3. In Task 4 we have tested these catalysts for oxidation of methane and did a number of blank experiments to determine the cause of the low methanol yield we have observed. Magnesia supported catalysts were prepared by first synthesizing the various metal tetrasulfophthalocyanines (TSPCs), converting them to the acid form, and then supporting these complexes on a basic support (MgO) by a neutralization reaction. The metals used were Ru, Pd, Cu, Fe, Co, Mn, and Mo. CoTSPC was also synthesized in zeolite Y using our standard template techniques described in Quarterly Report No. 1. These complexes were examined for catalytic activity in the oxidation of methane. The PdTSPC/MgO had greater activity, and oxidized some of the methane (selectivity of 2.8% from the methane oxidized at 375°C) to ethane. This is a much lower temperature for this reaction than previously reported in the literature. We also examined the reactivity of various components of the system in the oxidation of the product methanol. The reactor showed some activity for the oxidation of methanol to carbon dioxide. When zeolite or magnesia were added, this activity increased. The magnesia oxidized most of the methanol to carbon dioxide, while the zeolite reduced some of the methanol to hydrocarbons. With oxygen in the feed gas stream (i.e., the conditions of our methane oxidation), a very large fraction of the methanol was oxidized to carbon dioxide when passed over magnesia. From this, we can conclude that any methanol formed in the oxidation of methane would probably be destroyed very quickly on the catalyst bed.

23441 (DOE/PC/90011–T7) **Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 7, April 16, 1988–July 15, 1988.** Wilson, R.B. Jr.; Chan, Yee Wai; Posin, B.M. SRI International, Menlo Park, CA (United States). 31 Aug 1988. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-86PC90011. Order Number DE95014807. Source: OSTI; NTIS; GPO Dep.

The goal of this research is to develop catalysts that directly convert methane and light hydrocarbons to intermediates that later can be converted to either liquid fuels or value-added chemicals, as economics dictate. During this reporting period, much of our effort focused on investigating the stability of the methane reforming catalysts (Task 2) with respect to storage time. Many of these catalysts demonstrated lessened activity when they were reexamined up to 18 months after they ere first synthesized and tested. We also synthesized and tested two new phthalocyanines supported on magnesia (MgO) for examination in the methane oxidation reaction. We reexamined many of the hexaruthenium and tetraruthenium clusters which had been supported on zeolite Y, zeolite 5A, alumina or magnesia. These reexaminations were conducted at relatively slow flow rates (15 ml/min), since previous studies had shown that the lower flow rates maximized the conversion of methane in this reaction. In every case, the catalyst exhibited diminished activity compared to the earlier runs. In addition, the selectivity of the catalysts changed as well; relatively less C_2 and no C_6 was observed in the reactions conducted during this reporting period. In the previous technical report we reported that palladium tetrasulfophthalocyanine (PDTSPC) supported on MgO exhibited exceptional activity in the methane oxidation reaction; it produced ethane at much lower temperatures than previously reported in the literature. We synthesized two close analogues of this compound, one with a different metal (nickel) from the same family as palladium, and the other with a different substituent (carboxylic acid rather than sulfonic acid) on the phthalocyanine ring. Both of these complexes were supported on magnesia, and tested for activity. The nickel complex displayed some activity, producing only carbon dioxide and water.

23442 (DOE/PC/90011–T8) **Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 8, July 16–September 30, 1988.** Wilson, R.B. Jr.; Posin, B.M.; Chan, Yee Wai. SRI International, Menlo Park, CA (United States). 1 Mar 1989. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-86PC90011. Order Number DE95014808. Source: OSTI; NTIS; GPO Dep.

The goal of this research is to develop catalysts that directly convert methane and light hydrocarbons to intermediates that later can be converted to either liquid fuels or value-added chemicals, as economics dictate. During this reporting period, we investigated the behavior of some of our catalysts under working conditions using diffuse reflectance fourier transform infrared spectroscopy (DRIFT). Two catalysts ($FeRu_3$ and Ru_4 on magnesia) were examined under nitrogen, and the Ru_4/MgO system was examined under a methane/argon mixture. We synthesized ruthenium clusters supported on carbon as catalysts for methane reforming and new phthalocyanines to be used as catalyst precursors for oxidizing methane to methanol. The Ru_4 and $FeRu_3$ complexes supported on magnesia exhibited very different behavior in the DRIFT cell when heated under nitrogen. The $FeRu_3$/MgO system was completely decarbonylated by 400°C, while spectrum of the Ru_4 system displayed carbonyl peaks until the temperature rose to over 600°C. The ru_4/MgO system behaved almost identically under methane/argon as it did under nitrogen in the carbonyl region. In the C-H region of the spectrum (2800-3100 cm^{-1}), peaks were observed under methane but not under nitrogen. The intensity of these peaks did not vary with temperature. We synthesized new catalysts by supporting the Ru_4 and Ru_6 clusters on carbon. Both acidic zeolites (Type Y or 5A) and basic magnesia (MgO) have been observed to react with hydrocarbons at high temperatures; these reactions generally lead to coking, then deactivation of the catalyst contained on these supports. We expect carbon to be a truly inert support.

23443 (DOE/PC/90011–T9) **Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 9, October 1–December 31, 1988.** Wilson, R.B. Jr.; Posin, B.M.; Chan, Yee Wai. SRI International, Menlo Park, CA (United States). 10 Mar 1989. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-86PC90011. Order Number DE95014809. Source: OSTI; NTIS; GPO Dep.

The goal of this research is to develop catalysts that directly convert methane and light hydrocarbons to intermediates that later can be converted to either liquid fuels or value-added chemicals, as economics dictate. During this reporting period, we completed our IR spectroscopic examination of the Ru_4/MgO and $FeRu_3$/MgO systems under nitrogen and methane by examining $FeRu_3$/MgO under methane. This system behaved quite differently than the same system under nitrogen. Under methane, only one very broad peak is observed at room temperature. Upon heating, the catalyst transformed so that by 300°C, the spectrum of $FeRu_3$/MgO under methane was the same as that of Ru_4/MgO. This suggests that methane promotes the segregation of the metals in the mixed metal system. The differences in catalytic activity between the $FeRu_3$/MgO and Ru_4/MgO systems may then be due to the presence of IR transparent species such as iron ions which cause different nucleation in the ruthenium clusters. We examined several systems for activity in the methane dehydrogenation reaction. Focusing on systems which produce C_6 hydrocarbons since this is the most useful product. These systems all displayed low activity so that the amount of hydrocarbon product is very low. Some C_6 hydrocarbon is observed over zeolite supports, but its production ceases after the first few hours of reaction. We prepared a new system, Ru_4 supported on carbon, and examined its reactivity. Its activity was very low and in fact the carbon support had the same level of activity. We synthesized four new systems for examination as catalysts in the partial oxidation of methane. Three of these (PtTSPC/MgO, PtTSPC and PdTSPC on carbon) are analogs of

PdTSPC/MgO. This system is of interest because we have observed the production of ethane from methane oxidation over PdTSPC/MgO at relatively low temperatures and we wished to explore its generality among close analogs.

23444 (DOE/PC/90011–T10) **Direct catalytic conversion of methane and light hydrocarbon gases. Quarterly report No. 10, January 1–March 31, 1989.** Wilson, R.B. Jr.; Posin, B.M.; Chan, Yee Wai. SRI International, Menlo Park, CA (United States). 19 May 1989. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-86PC90011. Order Number DE95014810. Source: OSTI; NTIS; GPO Dep.

The goal of this research is to develop catalysts that directly convert methane and light hydrocarbons to intermediates that later can be converted to either liquid fuels or value-added chemicals, as economics dictate. In this reporting period, we have utilized samples of magnesia differing in their pretreatment temperature. Both the hydrido-ruthenium complex $H_4Ru_4(CO)_{12}$ and its reaction product with triethyl aluminum were reacted with these samples. The two ruthenium clusters are expected to react with the magnesia surface in different ways: by deprotonation of the hydride through an acid-base reaction with the basic surface, or by hydrolysis of the aluminum-carbon bond of the triethyl aluminum adduct. The concentration of hydroxyl groups on the magnesia surface able to hydrolyze the aluminum-carbon bond for immobilation should vary depending on the temperature of the pretreatment; the concentration of basic sites which can deprotonate the cluster should also vary with temperature. These differences were borne out by the experiment. We also compared the activity of two batches of $AlRu_4$/MgO which had been synthesized at different times in the project. Both batches had approximately the same activity, but the newer batch had greater selectivity for C_{6+} hydrocarbons.

23445 (LBL–37222) **Fundamental studies of the mechanism of catalytic reactions with catalysts effective in the gasification of carbon solids and the oxidative coupling of methane. Quarterly report, January 1, 1995–March 31, 1995.** Iglesia, E.; Perry, D.L.; Heinemann, H. Lawrence Berkeley Lab., CA (United States). Mar 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95015141. Source: OSTI; NTIS; GPO Dep.

The synthesis of ethane and ethylene from methane and oxygen will be carried out in novel hydrogen transport inorganic membranes and in cyclic reactors in order to prevent undesirable secondary reactions of C_2 molecules to CO and CO_2. Neither inorganic membrane reactors nor cyclic tubular reactors are presently used in commercial processes. Their application to catalytic reactions represents a novel application of engineering and solid-state chemistry concepts to catalytic reactions. Our approach combines high temperature membrane and cyclic experimental reactors, synthesis and characterization of thin membrane films and of high surface area catalysts, and detailed models of complex gas phase and surface reactions involved in oxidative coupling. We anticipate that this approach will lead to novel reactors for carrying our kinetic-controlled sequential reactions, such as the oxidative coupling of methane. Careful spectrographic and wet chemical analyses of fresh and silent catalysts have shown considerable differences which have permitted conclusions as to the source of deactivation. Our activities in the first quarter FYI 995 have focused on the synthesis, structural characterization, and catalytic evaluation of membrane films, disks, and reactors. We have also continued to exploit reaction-transport models to predict the performance of membrane, cyclic, and recycle reactors in the oxidative coupling of methane.

This report presents the development of Flaming Gorge Reservoir release patterns and resulting downstream flows and stages for four potential hydropower operational scenarios. The release patterns were developed for three representative hydrologic years: moderate, dry, and wet. Computer models were used to estimate flows and stages in the Green River resulting from these release patterns for the moderate water year. The four hydropower operational scenarios for Flaming Gorge Dam were year-round high fluctuating flows, seasonally adjusted high fluctuating flows, seasonally adjusted moderate fluctuating flows, and seasonally adjusted steady flows. The year-round high fluctuating flow scenario assumes that the monthly total reservoir releases would be the same as historical releases. The remaining seasonally adjusted flow scenarios would comply with the 1992 Biological Opinion of the US Fish and Wildlife Service, which requires high flows in the spring and limited hourly fluctuations, especially in summer and autumn releases, to protect endangered fish. Within one year, the maximum daily river stage fluctuations resulting from hydropower operations under the seasonally adjusted high fluctuating flow scenario would be similar to the maximum daily fluctuations under the year-round high fluctuating flow scenario. However, reduced or no fluctuations would occur in some time periods under the former scenario. The maximum daily river stage fluctuations under the seasonally adjusted moderate fluctuating flow scenario would be about half of those under the seasonally adjusted high fluctuating flow scenario.

23447 (ANL/EAD/TM–5) **Reservoir release patterns for hydropower operations at the Aspinall Unit on the Gunnison River, Colorado.** Yin, S.C.L. (Argonne National Lab., IL (United States). Environmental Assessment Div.); McCoy, J.J.; Sedlacek, J. Argonne National Lab., IL (United States). May 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95016231. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the development of reservoir release patterns for the Aspinall Unit, which includes Blue Mesa, Morrow Point, and Crystal Reservoirs on the Gunnison River in Colorado. Release patterns were assessed for two hydropower operational scenarios–seasonally adjusted steady flows and seasonally adjusted high fluctuating flows–and three representative hydrologic years–moderate (1987), dry (1989), and wet (1983). The release patterns for the operational scenarios were developed with the aid of monthly, daily, and hourly reservoir operational models, which simulate the linked operation of the three Aspinall Unit reservoirs. Also presented are reservoir fluctuations and downstream water surface elevations corresponding to the reservoir release patterns. Both of the hydropower operational scenarios evaluated are based on the ecological research flows proposed by the US Fish and Wildlife Service for the Aspinall Unit. The first operational scenario allows only seasonally adjusted steady flows (no hourly fluctuations at any dam within one day), whereas the second scenario permits high fluctuating flows from Blue Mesa and Morrow Point Reservoirs during certain times of the year. Crystal Reservoir would release a steady flow within each day under both operational scenarios.

23448 (ANL/EAD/TM–6) **Effects of Flaming Gorge Dam hydropower operations on sediment transport in the Browns Park reach of the Green River, Utah and Colorado.** Williams, G.P. (Argonne National Lab., IL (United States). Environmental Assessment Div.); Tomasko, D.; Cho, H.E.; Yin, S.C.L. Argonne National Lab., IL (United States). May 1995. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95016232. Source: OSTI; NTIS; INIS; GPO Dep.

Three methods for comparing sediment transport were applied to four proposed hydropower operational scenarios under study for Flaming Gorge Dam on the Green River in Utah. These methods were effective discharge, equilibrium potential, and cumulative sediment load with flow exceedance plots. Sediment loads transported by the Green River in the Browns Park reach were calculated with

the Engelund-Hansen equation for three historical water years and four hydropower operational scenarios. A model based on the Engelund-Hansen equation was developed using site-specific information and validated by comparing predictions for a moderate water year with measured historical values. The three methods were used to assess the impacts of hydropower operational scenarios on sediment resources. The cumulative sediment load method provided the most useful information for impact evaluation. Effective discharge was not a useful tool because of the limited number of discrete flows associated with synthetic hydrographs for the hydropower operational scenarios. The equilibrium potential method was relatively insensitive to the variations in operating conditions, rendering it comparatively ineffective for impact evaluation.

23449 (ANL/EAD/TM–10) **Potential effects of four Flaming Gorge Dam hydropower operational scenarios on riparian vegetation of the Green River, Utah and Colorado.** LaGory, K.E. (Argonne National Lab., IL (United States). Ecological Sciences Section); Van Lonkhuyzen, R.A. Argonne National Lab., IL (United States). Jun 1995. 104p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95016233. Source: OSTI; NTIS; INIS; GPO Dep.

Four hydropower operational scenarios at Flaming Gorge Dam were evaluated to determine their potential effects on riparian vegetation along the Green River in Utah and Colorado. Data collected in June 1992 indicated that elevation above the river had the largest influence on plant distribution. A lower riparian zone occupied the area between the approximate elevations of 800 and 4,200-cfs flows–the area within the range of hydropower operational releases. The lower zone was dominated by wetland plants such as cattail, common spikerush, coyote willow, juncus, and carex. An upper riparian zone was above the elevation of historical maximum power plant releases from the dam (4,200 cfs), and it generally supported plants adapted to mesic, nonwetland conditions. Common species in the upper zone included box elder, rabbitbrush, grasses, golden aster, and scouring rush. Multispectral aerial videography of the Green River was collected in May and June 1992 to determine the relationship between flow and the areas of water and the riparian zone. From these relationships, it was estimated that the upper zone would decrease in extent by about 5% with year-round high fluctuation, seasonally adjusted high fluctuation, and seasonally adjusted moderate fluctuation, but it would increase by about 8% under seasonally adjusted steady flow. The lower zone would increase by about 13% for both year-round and seasonally adjusted high fluctuation scenarios but would decrease by about 40% and 74% for seasonally adjusted moderate fluctuation and steady flows, respectively. These changes are considered to be relatively minor and would leave pre-dam riparian vegetation unaffected. Occasional high releases above power plant capacity would be needed for long-term maintenance of this relict vegetation.

23450 (DOE/BP/00276–2) **Yakima River radio-telemetry study: Steelhead, 1989–93.** Hockersmith, E.; Vella, J.; Stuehrenberg, L.; Iwamoto, R.N.; Swan, G. National Marine Fisheries Service, Seattle, WA (United States). Coastal Zone and Estuarine Studies Div. Jan 1995. 99p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI79-89BP00276. Order Number DE95014444. Source: OSTI; NTIS; GPO Dep.

A 4-year radio-telemetry study was made of steelhead in the Yakima River basin, with the objectives of determining the run timing, passage patterns at irrigation diversion dams, and morphometric characteristics of different Yakima basin steelhead substocks and determining where and when the substocks become separated; evaluating adult steelhead passage at Yakima River basin diversion dams; determining steelhead migration , temporal distribution, and habitat utilization in the Yakima River basin; identifying spawning distribution and timing of steelhead; and determining the amount and cause of pre-spawning mortality of radio-tagged steelhead. Recommendations are given.

23451 (DOE/BP/01385–5) **Evaluation of juvenile fish bypass and adult fish passage facilities at water diversions on the Umatilla River. Annual report, 1994.** Knapp, S.M. Oregon Dept. of Fish and Wildlife, Portland, OR (United States). Jan 1995. 143p. Sponsored by USDOE, Washington, DC (United States). DOE Contract BI79-89BP01385. Order Number DE95014446. Source: OSTI; NTIS; GPO Dep.

We report on our progress from October 1993 through September 1994 in evaluating juvenile salmonid bypass facilities and juvenile salmonid passage through ladder facilities, and investigating passage conditions for juvenile fish at diversion dam facilities on the lower Umatilla River in northeastern Oregon. We also report on our progress in evaluating adult salmonid passage at and between dams on the lower Umatilla River and upriver migration using radio telemetry. Two principal studies are also included. Report A (ODFW): To evaluate the juvenile salmonid bypass facilities a Feed and Furnish canals, juvenile salmonid passage through fish ladders at Stanfield, Feed Canal, Westland, and Three Mile Falls dams, and the juvenile salmonid trap and haul procedures at Westland Canal. To investigate passage conditions at all passage facilities. Report B (CTUIR): To examine the passage of adult salmonids past diversions in the lower Umatilla River and their movement in the upper river after transport, using radio telemetry, and to assess factors for successful homing. These studies are part of a program to rehabilitate anadromous fish stocks in the Umatilla River Basin, including restoration of coho salmon (Oncorhynchus kisutch) and chinook salmon (Oncorhynchus tshawytscha), as well as enhancement of summer steelhead (Oncorhynchus mykiss).

23452 (DOE/BP–2589) **Yakima Fisheries Project revised Draft Environmental Impact Statement: Summary.** USDOE Bonneville Power Administration, Portland, OR (United States). May 1995. 17p. Sponsored by USDOE, Washington, DC (United States). (DOE/EIS–0169). Order Number DE95014756. Source: OSTI; NTIS; INIS; GPO Dep.

The Bonneville Power Administration (BPA) proposes to fund the Yakima Fisheries Project (YFP) to undertake fishery research and enhancement activities in the Yakima River Basin. The State of Washington and the Yakima Indian Nation would jointly direct the project. The Yakima River system is a promising location for mitigation and enhancement to compensate for stock losses from development and operation of hydroelectric projects elsewhere in the Columbia Basin. The YFP would help determine the role that supplementation might play in increasing natural production of anadromous salmonids throughout the Columbia Basin. In cooperation with BPA, the project managers propose to construct, operate and maintain anadromous (e.g. salmon) fish production facilities. The goal is to conduct research activities designed to increase knowledge of supplementation techniques. These techniques would be applied to rebuild naturally spawning anadromous fish stocks historically present in the Yakima River Basin and, ultimately, those throughout the Columbia River Basin. Eventually, the YFP might involve the supplementation of all stocks of anadromous fish known to have occurred in the Yakima Basin. However, at this time only two alternatives have been proposed: Alternative 1 would supplement depressed naturally spawning populations of upper Yakima spring chinook salmon; Alternative 2 (preferred) would include all actions under Alternative 1; it would also add a study to determine the feasibility of re-establishing a naturally spawning population and a significant fall fishery for coho salmon in the Yakima Basin. (Coho smolts are currently being imported from another basin under the Columbia River Basin Fish Management Plan; the stock is now virtually eliminated from the Basin.)

23453 (DOE/BP/10891–2) **Survival estimates for the passage of juvenile salmonids through Snake River dams and reservoirs, 1994.** Muir, W.D. (and others); Smith, S.G.; Iwamoto, R.N. National Marine Fisheries Service, Seattle, WA (United States). Coastal Zone and Estuarine Studies Div. Feb 1995. 210p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI79-93BP10891. Order Number DE95014363. Source: OSTI; NTIS; GPO Dep.

In 1994, the National Marine Fisheries Service and the University of Washington completed the second year of a multi-year study to estimate survival of juvenile salmonids (Oncorhynchus spp.) passing through the dams and reservoirs of the Snake River. Actively migrating smolts were collected at selected locations above, at, and below Lower Granite Dam, tagged with passive integrated transponder (PIT) tags, and released to continue their downstream

migration. Survival estimates were calculated using the Single-Release, Modified Single-Release, and Paired-Release Models.

23454 (DOE/BP/11631–10) **Smolt monitoring at the Head of Lower Granite Reservoir and Lower Granite Dam. Annual report for 1993 Operations.** Buettner, E.W.; Brimmer, A.F. Idaho Dept. of Fish and Game, Boise, ID (United States). Mar 1995. 74p. Sponsored by USDOE, Washington, DC (United States). DOE Contract BI79-83BP11631. Order Number DE95014411. Source: OSTI; NTIS; GPO Dep.

This project monitored the daily passage of chinook salmon Oncorhynchus tshawytscha and steelhead trout O. mykiss smolts during the 1993 spring outmigration at migrant traps on the Snake River, Clearwater River and Salmon River.

23455 (DOE/BP/11982–5) **A study to determine the biological feasibility of a new fish tagging system, 1990–1993.** Prentice, E.F. (and others); Maynard, D.J.; Downing, S.L. National Marine Fisheries Service, Seattle, WA (United States). Coastal Zone and Estuarine Studies Div. 1994. 250p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI79-84BP11982. Order Number DE95014448. Source: OSTI; NTIS; GPO Dep.

In 1983, the National Marine Fisheries Service (NMFS) began a multiyear cooperative research program with the Bonneville Power Administration (BPA) to evaluate a new miniaturized identification system that could be used with salmonids. The system is referred to as the passive-integrated-transponder (PIT) tagging and interrogation system. The program has focused on determining the effects of PIT tags on juvenile and adult salmonids, as well as the development and evaluation of tagging and interrogation methods. Earlier results of the program have been reported in annual reports and journal articles cited in this report. This report covers the work per formed from 1990 through 1993. For convenience, the report is divided into three sections: (1) Interrogation and separation systems at Columbia River Basin dams; (2) Systems development and evaluation; and (3) Information and technology transfer.

23456 (DOE/BP/21182–5) **Intensive evaluation and monitoring of chinook salmon and steelhead trout production, Crooked River and Upper Salmon River sites. Annual progress report, January 1, 1992–December 31, 1992.** Kiefer, R.B.; Lockhart, J.N. Idaho Dept. of Fish and Game, Boise, ID (United States). Fisheries Research Section. Dec 1994. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract BI79-91BP21182. Order Number DE95014408. Source: OSTI; NTIS; GPO Dep.

The purpose of this intensive monitoring project is to determine the number of returning chinook salmon Oncorhynchus tshawytscha and steelhead trout 0. mykiss adults necessary to achieve optimal smolt production, and develop mitigation accounting based on increases in smolt production. Two locations in Idaho are being intensively studied to meet these objectives. Information from this research will be applied to parr monitoring streams statewide to develop escapement objectives and determine success of habitat enhancement projects.

23457 (DOE/BP/25105–2) **Analysis of chinook salmon in the Columbia River from and ecosystem perspective. Final report.** Lichatowich, J.A.; Mobrand, L.E. Mobrand Biometrics, Inc., Vashon Island, WA (United States). Jan 1995. 102p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AM79-92BP25105. Order Number DE95014417. Source: OSTI; NTIS; GPO Dep.

Ecosystem Diagnosis and Treatment (EDT) methodology was applied to the analysis of chinook salmon in the mid-Columbia subbasins which flow through the steppe and steppe-shrub vegetation zones. The EDT examines historical changes in life history diversity related to changes in habitat. The emphasis on life history, habitat and historical context is consistent with and ecosystem perspective. This study is based on the working hypothesis that the decline in chinook salmon was at least in part due to a loss of biodiversity defined as the intrapopulation life history diversity. The mid Columbia subbasins included in the study are the Deschutes, John Day, Umatilla, Tucannon and Yakima.

23458 (DOE/BP/35768–4) **Umatilla River Basin Anadromous Fish Habitat Enhancement Project. annual report 1991.** Scheeler, C.A. Confederated Tribes of the Umatilla Indian Reservation, Pendleton, OR (United States). Dept. of Natural Resources. Jan 1993. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract BI79-87BP35768. Order Number DE95013842. Source: OSTI; NTIS; GPO Dep.

The Umatilla habitat improvement program targets the improvement of water quality and restoration of riparian areas, holding, spawning,and rearing habitats of steelhead, spring and fall Chinook and coho salmon. This report covers work accomplished by the Confederated Tribes of the Umatilla Indian Reservation from April 1991 through May 1992. This program is funded under the Northwest Power Planning Council's Columbia River Basin Fish and Wildlife Program (Measure 704 (d)(1) 34.02) as partial mitigation for construction of hydroelectric dams and the subsequent losses of anadromous fish throughout the Columbia River system.

23459 (DOE/BP/35768–5) **Umatilla River Basin Anadromous Fish Habitat Enhancement Project. 1992 annual report.** Scheeler, C.A.; Shaw, R.T. Confederated Tribes of the Umatilla Indian Reservation, Pendleton, OR (United States). Dept. of Natural Resources. Jan 1994. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract BI79-87BP35768. Order Number DE95014410. Source: OSTI; NTIS; GPO Dep.

The Umatilla habitat improvement program targets improvement of water quality and the restoration of riparian areas, holding, spawning and rearing habitats of steelhead, spring and fall Chinook and coho salmon. The Confederated Tribes of the Umatilla Indian Reservation are responsible for enhancing stream reaches within the Reservation boundaries as guided by an implementation plan developed cooperatively with the Oregon Department of Fish and Wildlife and the U.S.D.A. Forest Service, Umatilla National Forest. Enhancements included the construction of nine boulder deflectors, two boulder weirs with pools, and 4 instream boulder placements. Instream cover was improved through the placement of 38 instream cover trees that were cabled to anchor boulders and four rootwads placed and anchored in pools. High tensile fence was constructed along 1.2 miles of stream bank to exclude livestock from riparian areas.

23460 (DOE/BP/41841–2) **Redfish Lake sockeye salmon captive broodstock rearing and research. Annual report 1993.** Flagg, T.A. (National Marine Fisheries Service, Seattle, WA (United States). Coastal Zone and Estuarine Studies Div.); McAuley, W.C. National Marine Fisheries Service, Seattle, WA (United States). Coastal Zone and Estuarine Studies Div.; USDOE Bonneville Power Administration, Portland, OR (United States). Div. of Fish and Wildlife. Nov 1994. 99p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI79-92BP41841. Order Number DE95014415. Source: OSTI; NTIS; GPO Dep.

The National Marine Fisheries Service (NMFS), in cooperation with Idaho and BPA, has established captive broodstocks to aid recovery of endangered Snake River sockeye salmon. NMFS is currently maintaining four separate Redfish Lake sockeye Salmon captive broodstocks; all these broodstocks are being reared full-term to maturity in fresh (well) water. Experiments are also being conducted on nonendangered 1990 and 1991-brood Lake Wenatchee (WA) sockeye salmon to compare effects on survival and reproduction to maturity in fresh water and seawater; for both brood-years, fish reared in fresh water were larger than those reared in seawater. Data from captive rearing experiments suggest a ranking priority of circular tanks supplied with pathogen-free fresh water, circular tanks supplied with pumped/filtered/uv-sterilized seawater, and seawater net-pens for rearing sockeye salmon to maturity.

23461 (DOE/BP/91819–10) **Artificial imprinting and smoltification in juvenile kokanee salmon: Implications for operating Lake Roosevelt kokanee salmon hatcheries. Annual report 1994.** Tilson, M.B.; Scholz, A.T.; White, R.J.; Hendrickson, J.L. Eastern Washington Univ., Cheney, WA (United States). Upper Columbia United Tribes Fisheries Research Center. Feb 1995. 127p. Sponsored by USDOE, Washington, DC (United States). DOE Contract BI79-88BP91819. Order Number DE95014445. Source: OSTI; NTIS; GPO Dep.

At the kokanee salmon hatcheries on Lake Roosevelt, constructed as partial mitigation for effects from Grand Coulee Dam, adult returns have been poor. The reason may be in the imprinting or in the smoltification. A study was initiated in 1992 to determine if there was a critical period for thyroxine induced olfactory imprinting in kokanee salmon; experiments were conducted on imprinting to morpholine and phenethyl alcohol. Other results showed that chemical imprinting coincided with elevated thyroxine levels in 1991 kokanee exposed to synthetic chemicals in 1992. In this resport, imprinting experiments were repeated; results showed that imprinting occurred concomitant with elevated thyroxine levels in 1991 kokanee exposed to synthetic chemicals in 1992 and tested in 1994 as age 3 spawners. Imprinting also occurred at the same time as thyroxine peaks in 1992 kokanee exposed to synthetic chemicals in 1993 and tested as age 2 spawners. In both groups fish that had the highest whole body thyroxine content (swimup stage) also had the highest percentage of fish that were attracted to their exposure odor in behavioral tests. So, kokanee salmon imprinted to chemical cues during two sensitive periods during development, at the alevin/swimup and smolt stages. A field test was conducted in Lake Roosevelt on coded wire tagged fish. Smoltification experimentswere conducted from 1992 to 1994. Recommendations are made for the Lake Roosevelt kokanee hatcheries.

23462 (DOE/BP/93743–1) **Kootenai River white sturgeon studies.** Anders, P.J. Kootenai Tribe of Idaho, Bonners Ferry, ID (United States). Dec 1993. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract BI79-88BP93743. Order Number DE95014443. Source: OSTI; NTIS; GPO Dep.

This report evaluates natural spawning of white sturgeon in the Kootenai River before, during and after the 1993 augmented discharge period. To determine how altering the operation of Libby Dam may improve conditions for natural spawning of white sturgeon in the Kootenai River, discharge from Libby Dam (with no power peaking or load following) was increased to produce 20 kcfs (± 2 kcfs) discharge at Bonners Ferry, Idaho, for a 14 day period June 2–16. Objectives of this research were to determine if white sturgeon spawned in the Kootenai River during 1993; and collect baseline biological data including timing, location, and habitat requirements of white sturgeon spawning in the Kootenai River in order to formulate and implement future flow regimes as effective recovery measures for white sturgeon. While sampling is not expected to collect a majority of white sturgeon eggs or larvae produced in a river, the fact that over 41,000 hours of sampling (combined gear) collected only 3 white sturgeon eggs and no larvae suggests that spawning conditions during 1993 were inadequate to benefit this population.

23463 (DOE/EA–1040) **Lower Columbia river terminal fisheries research project. Final environmental assessment.** Bonneville Power Administration, Portland, OR (United States). Apr 1995. 67p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014998. Source: OSTI; NTIS; GPO Dep.

This notice announces BPA'S's decision to fund the Oregon Department of Fish and Wildlife (ODFW), the Washington Department of Fish and Wildlife (WDFW), and the Clatsop Economic Development Committee for the Lower Columbia River Terminal Fisheries Research Project (Project). The Project will continue the testing of various species/stocks, rearing regimes, and harvest options for terminal fisheries, as a means to increase lower river sport and commercial harvest of hatchery fish, while providing both greater protection of weaker wild stocks and increasing the return of upriver salmon runs to potential Zone 6 Treaty fisheries. The Project involves relocating hatchery smolts to new, additional pen locations in three bays/sloughs in the lower Columbia River along both the Oregon and Washington sides. The sites are Blind Slough and Tongue Point in Clatsop County, Oregon, and Grays Bay/Deep River, Wahkiakum County, Washington. The smolts will be acclimated for various lengths of time in the net pens and released from these sites. The Project will expand upon an existing terminal fisheries project in Youngs Bay, Oregon. The Project may be expanded to other sites in the future, depending on the results of this initial expansion. BPA'S has determined the project is not a major Federal action significantly affecting the quality of the human environment, within the meaning of the National Environmental Policy Act (NEPA) of 1969. Therefore, the preparation of an environmental impact statement is not required, and BPA'S is issuing this FONSI.

23464 (DOE/EIS–0169) **Yakima fisheries project. Revised draft environmental impact statement.** USDOE Bonneville Power Administration, Portland, OR (United States). May 1995. 391p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014364. Source: OSTI; NTIS; INIS; GPO Dep.

BPA proposes to fund several fishery-related activities in the Yakima River Basin. These activities, known as the Yakima Fisheries Project (YFP), would be jointly managed by the State of Washington and the Yakima Indian Nation. The YFP is included in the Northwest Power Planning Council's (Council's) fish and wildlife program. The Council selected the Yakima River system for attention because fisheries resources are severely reduced from historical levels and because there is a significant potential for enhancement of these resources. BPA's proposed action is to fund (1) information gathering on the implementation of supplementation techniques and on feasibility of reintroducing coho salmon in an environment where native populations have become extinct; (2) research activities based on continuous assessment, feedback and improvement of research design and activities (adaptive management); and (3) the construction, operation, and maintenance of facilities for supplementing populations of upper Yakima spring chinook salmon. Major issues examined in the Revised Draft EIS include potential impacts of the project on genetic and ecological resources of existing fish populations, on water quality and quantity, on threatened and endangered species listed under the Endangered Species Act, and on the recreational fishery. Only minor differences in environmental consequences were found between Alternatives 1 and 2. Potentially high impacts on wild, native, and non-target fish populations under both alternatives would be mitigated through careful adherence to the adaptive management process outlined in the EIS.

23465 (DOE/EIS–0169-Rev.) **Yakima Fisheries Project: Revised draft environmental impact statement.** USDOE Bonneville Power Administration, Portland, OR (United States). May 1995. 391p. Sponsored by USDOE, Washington, DC (United States). (DOE/BP–2588). Order Number DE95015000. Source: OSTI; NTIS; GPO Dep.

BPA proposes to fund several fishery-related activities in the Yakima River Basin. The Yakima Fisheries Project (YFP), included in the Northwest Power Planning Council's fish and wildlife program, would be jointly managed by the State of Washington and the Yakima Indian Nation. Fisheries resources in the Yakima River are severely reduced from historical levels and there is a significant potential for enhancement of these resources. BPA's proposed action is to fund (1) information gathering on the implementation of supplementation techniques and on feasibility of reintroducing coho salmon in an environment where native populations have become extinct; (2) research activities based on continuous assessment, feedback and improvement of research design and activities ("adaptive management"); and (3) the construction, operation, and maintenance of facilities for supplementing populations of upper Yakima spring chinook salmon. The project has been considerably revised from the original proposal described in the first draft EIS. Examined in addition to No Action (which would leave present anadromous fisheries resources unchanged in the, Basin) are two alternatives for action: (1) supplementation of depressed natural populations of upper Yakima spring chinook and (2) that same supplementation plus a study to determine the feasibility of re-establishing (via stock imported from another basin) naturally spawning population and a significant fall fishery for coho in the Yakima Basin. Alternative 2 has been identified as the preferred action. Major issues examined in the Revised Draft EIS include potential impacts of the project on genetic and ecological resources of existing fish populations, on water quality and quantity, on threatened and endangered species listed under the Endangered Species Act, and on the recreational fishery.

14 SOLAR ENERGY

1405 Solar Energy Conversion

23466 (CONF-940423–2) **Numerical modeling of the temperature illumination intensity dependent performance of CIS solar cells.** Lee, Y.J. (Purdue Univ., Lafayette, IN (United States). School of Electrical Engineering); Gray, J.L. National Renewable Energy Lab., Golden, CO (United States); Purdue Univ., Lafayette, IN (United States). School of Electrical Engineering. [1994]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. From 12. European photovoltaic solar energy conference and exhibition; Amsterdam (Netherlands); 11-15 Apr 1994. Order Number DE95016104. Source: OSTI; NTIS; GPO Dep.

In this paper, the temperature dependence of CIS solar cell illuminated I-V is studied numerically using ADEPT. The effects of having a second junction either at the interface or at the back contact are investigated. These two placements of the second junction result in two distinctive shapes of the I-V at low temperatures. Both of these distinctive shapes have been observed experimentally.

23467 (CONF-941203–28) **Numericl modeling of graded band gap CIGS solar cells.** Gray, J.L.; Lee, Youn Jung. Purdue Univ., Lafayette, IN (United States). School of Electrical Engineering. [1994]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. From 1. world conference on photovoltaic energy conversion; Waikoloa, HI (United States); 5-9 Dec 1994. Order Number DE95016102. Source: OSTI; NTIS; GPO Dep.

The high efficiency reported recently by NREL for CIGS solar cells demonstrates the potential of band gap grading in producing high efficiency thin film solar cells. In order to reap the full benefits of this design strategy, a clear understanding of the fundamental device physics of these structures is needed. The purpose of this paper is to examine the role grading of the band gap plays in achieving high conversion efficiencies. To aid in this examination, a detailed numerical device simulation program, ADEPT, is used.

23468 (DOE/ER/13969–3) **The Center for the Study of Early Events in Photosynthesis. Final report, September 1, 1988–August 31, 1994.** Orr, L.A. Arizona State Univ., Tempe, AZ (United States). [1994]. 108p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER13969. Order Number DE95013801. Source: OSTI; NTIS; GPO Dep.

The ASU Center for the Study of Early Events in Photosynthesis was established in 1988 with funding through a five-year grant from the USDA/DOE/NSF Plant Science Center program and a grant from the NSF Biological Facilities program. Its scientific objective is to elucidate the basic principles that govern photosynthetic energy collection and storage. Understanding these principles is vital to mankind, as photosynthesis provides most of our food, fiber and energy needs. The Center attempts to fulfill this objective through research of the highest standard, coupled inextricably with quality education at the undergraduate, graduate and postdoctoral levels. These goals are met via a network of collaborative, interdisciplinary research groups comprising 100 personnel within the Department of Chemistry and Biochemistry, the Department of Botany, and the Department of Physics and Astronomy. The work of these research groups is facilitated by the Center through a variety of important infrastructural functions.

23469 (ETDE-BR–0007) **Techniques for the obtention of thin junctions aiming the fabrication of solar cells for space application.** Beloto, A.F. (Instituto de Pesquisas Espaciais, Sao Paulo, SP (Brazil)); Pereyra, I. No corporate text available. [1995]. 3p. (In Portugese). Order Number DE95789951. Source: OSTI; NTIS (US Sales Only).

Two annealing techniques used for solar cells fabrication were compared in order to determine the annealing effects on cells and to verify their performance. An experimental study aiming the development of ion implantation silicon solar cells for space use is studied. 5 refs, 2 figs, 2 tabs

23470 (ETDE-BR–0011) **Study of the characteristics of single crystal silicon solar cells.** Beloto, Antonio Fernando. Sao Paulo Univ., Sao Carlos, SP (Brazil). Inst. de Fisica e Quimica. 1983. 146p. (In Portugese). Order Number DE95789955. Source: OSTI; NTIS (US Sales Only).

Systems of measurement were developed for the characterization of single crystal silicon solar cells. For that, the curves I x V were measured in the dark and for different intensity of illumination. Curves of spectral response and of capacitance as a function of the reciprocal of the voltage were also measured. The behavior of the cells as a function of temperature was analysed and also measurements of junction depth were made by three different methods. values for the parameters that characterize the cells were obtained, showing a good agreement with theoretical values and also with already reported values. (author). 30 refs, 63 figs, 10 tabs

23471 (ETDE/CH-mf–95795488) **Paul Scherrer Institut annual report 1994. Annex III B: PSI applied solid state physics.** Kuse, D. (ed.). Paul Scherrer Inst. (PSI), Villigen (Switzerland). Dept. F3B Applied Solid State Physics. [1995]. 82p. Order Number DE95795488. Source: OSTI; NTIS.

The document reports on PSI Department IIIB's progress achieved during 1994 in the fields of nanotechnology, photovoltaics, semiconductor quantum structures, III-V heterostructure devices, micro- and integrated optics, optical metrology. Facilities for micro- and nanotechnology at PSI Villigen are described. A bibliography of the department's publication is included. figs., tabs., refs.

23472 (NREL/SP–463-7668) **User's manual for TMY2s: Derived from the 1961–1990 National Solar Radiation Data Base.** Marion, W.; Urban, K. National Renewable Energy Lab., Golden, CO (United States). Jun 1995. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95004064. Source: OSTI; NTIS; GPO Dep.

This report is a user's manual that describes typical meteorological year (TMY) data sets derived from the 1961-1990 National Solar Radiation Data Base. The TMY is a data set of hourly values of solar radiation and meteorological elements for a 1-year period. The intended use if for computer simulations of solar energy conversion systems and building systems. Section 1 of the manual provides general information about the TMYs; Section 2 lists the stations and provides station identifying information and classification; Section 3 details the contents of the TMY2 files and provides the hourly records of data values; Section 4 compares TMY2 with 30-year data sets; Appendices provide procedures used to develop TMYs and a table to convert SI data to other units.

23473 (NREL/TP–410-7993) **NREL Photovoltaic Program. FY 1994 annual report, October 1, 1993–September 30, 1994.** National Renewable Energy Lab., Golden, CO (United States). Jun 1995. 427p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95009244. Source: OSTI; NTIS; GPO Dep.

This report summarizes the in-house and subcontracted research and development activities under the National renewable Energy Laboratory (NREL) Photovoltaics (PV) program for fiscal year 1994. Research is organized under the following areas; PV program management; crystalline silicon and advanced devices; thin-film PV technologies; PV manufacturing; PV module and system performance and engineering; and PV applications and markets.

23474 (NREL/TP–411-8005) **Development of a photovoltaic module energy ratings methodology.** Kroposki, B. (National Renewable Energy Lab., Golden, CO (United States)); Mrig, L.; Whitaker, C.; Newmiller, J. National Renewable Energy Lab., Golden, CO (United States). May 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. (CONF-950585–1: 13. NREL photovoltaics program review meeting, Lakewood, CO (United States), 16-19 May 1995). Order Number DE95009221. Source: OSTI; NTIS; GPO Dep.

The National Renewable Energy Laboratory has begun work on developing a consensus-based approach to rating photovoltaic modules. This new approach was intended to address the limitations of the defacto standard module power rating at standard test conditions. Using technical input from a number of sources, and under the guidance of an industry-based technical review committee, the approach described in this paper was developed. The Module

Energy Rating (MER) consists of 10 estimates of how much energy a single typical module of a particular type will produce in one day, one for each of 5 different weather/location combinations and 2 load-types. This paper presents an overview of the procedures required to generate an MER for any particular module type.

23475 (NREL/TP–411-8019) **The future of amorphous silicon photovoltaic technology.** Crandall, R.; Luft, W. National Renewable Energy Lab., Golden, CO (United States). Jun 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95009235. Source: OSTI; NTIS; GPO Dep.

Amorphous silicon modules are commercially available. They are the first truly commercial thin-film photovoltaic (PV) devices. Well-defined production processes over very large areas (>1 m^2) have been implemented. There are few environmental issues during manufacturing, deployment in the field, or with the eventual disposal of the modules. Manufacturing safety issues are well characterized and controllable. The highest measured initial efficiency to date is 13.7% for a small triple-stacked cell and the highest stabilized module efficiency is 10%. There is a consensus among researchers, that in order to achieve a 15% stabilized efficiency, a triple-junction amorphous silicon structure is required. Fundamental improvements in alloys are needed for higher efficiencies. This is being pursued through the DOE/NREL Thin-Film Partnership Program. Cost reductions through improved manufacturing processes are being pursued under the National Renewable Energy Laboratory/US Department of Energy (NREL/DOE)-sponsored research in manufacturing technology (PVMaT). Much of the work in designing a-Si devices is a result of trying to compensate for the Staebler-Wronski effect. Some new deposition techniques hold promise because they have produced materials with lower stabilized defect densities. However, none has yet produced a high efficiency device and shown it to be more stable than those from standard glow discharge deposited material.

23476 (NREL/TP–413-8121) **Research on high-efficiency, large-area $CuInSe_2$-based thin-film modules. Final subcontract report, 16 August 1993–30 June 1995.** Tarrant, D.E. (Siemens Solar Industries, Camarillo, CA (United States)); Gay, R.R. National Renewable Energy Lab., Golden, CO (United States); Siemens Solar Industries, Camarillo, CA (United States). Jul 1995. 99p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95009257. Source: OSTI; NTIS; GPO Dep.

This final subcontract report, describing work to fabricate a large-area, stable, 12.5% (aperture)-efficient encapsulated $CuInSe_2$ (CIS) module by scalable, low-cost techniques on inexpensive substrates. Demonstrated encapsulated module efficiencies (encapsulated 12.8%-efficient mini-module on 68.9cm^2 and an NREL-verified 12.7%-efficient unencapsulated circuit on 69 CM^2 with a prismatic cover) are the highest reported mini-module demonstrated (and verified by NREL). This is the first thin-film module of its size to exceed the 10% efficiency level. SSI also supplied NREL with a 1-kW array of large-area (~3890 CM^2) approximately 30-W modules. The NREL-verified performance of this array is a significant step toward meeting the efficiency target of the USDOE Five-Year Plan goals of 8%–10%-efficient commercial thin-film, flat-plate modules. Long-term outdoor stability of CIS and CIS-based absorbers was demonstrated by testing at NREL. Excellent stability was demonstrated for 6 years of outdoor exposure. The stability of the 1-kW Siemens CIS array, installed and tested at NREL, was also demonstrated for an exposure of about 1 year. The foundations have been laid to meet the thin-film milestones of the DOE Five-Year Plan. Outdoor testing has demonstrated excellent intrinsic module stability. Future plans include scaling these results to larger areas and emphasizing the reduction of variation methodology to lay the foundation for demonstrating the potential of CIS as a future commercial product.

23477 (NREL/TP–451-8101) **Research on the stability, electronic properties, and structure of a-Si:H and its alloys. Final subcontract report, 1 June 1991–31 May 1994.** Jackson, W.B. (Xerox Palo Alto Research Center, CA (United States)); Johnson, N.; Nickel, N.; Schumm, G.; Street, R.A.; Thompson, R.; Tsai, C.C.; Van de Walle, C.; Walker, J. National Renewable Energy Lab., Golden, CO (United States); Xerox Palo Alto Research Center, CA (United States). Jul 1995. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95009238. Source: OSTI; NTIS; GPO Dep.

The authors research has focused on defect metastability and a-Si:C:H alloys. A new aspect of the metastability is the growing interest in the defect recovery process. They have continued to explore the role of hydrogen in the metastability and other properties of a-Si:H. This has led them to perform first principles calculations of Si-H bonding configurations. Another new feature of the metastability work is the study of the effects in hydrogenated polysilicon. They have grown and studied the properties of a-Si:C:H alloys, particularly to observe the effects of hydrogen dilution. Finally they have also studied the recent defect relaxation phenomenon, and concluded that the effects arise from contact effects and are not an intrinsic effect in a-Si:H. Section A presents some recent models of metastability. Section B discusses the metastability and equilibration effects in hydrogenated polysilicon, studied because of it's close similarity to a-Si:H. Section C describes results on a-Si:C:H alloys. Section D contains first principle LDA calculations of Si-H bonds and relates these results to the a-Si:H diffusion and metastability properties. In section E the authors report capacitance measurements aimed at exploring the recent results by Cohen et al who find an anomalous relaxation process from the trap filling kinetics of a DLTS experiment.

23478 (NREL/TP–451-8117) **Numerical modeling of $CuInSe_2$ and CdTe solar cells. Annual subcontract report, March 1, 1994–February 28, 1995.** Gray, J.L. (Purdue Univ., West Lafayette, IN (United States)); Schwartz, R.J.; Lee, Y.J. National Renewable Energy Lab., Golden, CO (United States). Jul 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95009263. Source: OSTI; NTIS; GPO Dep.

This report describes a mathematical model for application to copper selenide solar cells, indium selenide solar cells, and cadmium telluride solar cells.

23479 (UCRL-JC–118267) **A solar module fabrication process for HALE solar electric UAVs.** Carey, P.G. (Lawrence Livermore National Lab., CA (United States)); Aceves, R.C.; Colella, N.J.; Williams, K.A.; Sinton, R.A.; Glenn, G.S. Lawrence Livermore National Lab., CA (United States). 12 Dec 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941203–25: 1. world conference on photovoltaic energy conversion, Waikoloa, HI (United States), 5-9 Dec 1994). Order Number DE95011719. Source: OSTI; NTIS; GPO Dep.

We describe a fabrication process used to manufacture high power-to-weight-ratio flexible solar array modules for use on high-altitude-long-endurance (HALE) solar-electric unmanned air vehicles (UAVs). These modules have achieved power-to-weight ratios of 315 and 396 W/kg for 150μm-thick monofacial and 110μm-thick bifacial silicon solar cells, respectively. These calculations reflect average module efficiencies of 15.3% (150μm) and 14.7% (110μm) obtained from electrical tests performed by Spectrolab, Inc. under AMO global conditions at 25°C, and include weight contributions from all module components (solar cells, lamination material, bypass diodes, interconnect wires, and adhesive tape used to attach the modules to the wing). The fabrication, testing, and performance of 32 m^2 of these modules will be described.

This operation and maintenance manual contains the information necessary to run the Photovoltaics for Utility Scale Applications

(PVUSA) test facility in Davis, California. References to more specific information available in drawings, data sheets, files, or vendor manuals are included. The PVUSA is a national cooperative research and demonstration program formed in 1987 to assess the potential of utility scale photovoltaic systems.

23481 (DOE/AL/82993–19) **Photovoltaic balance-of-system designs and costs at PVUSA.** Reyes, A.B.; Jennings, C. Pacific Gas and Electric Co., San Ramon, CA (United States). Dept. of Research and Development. May 1995. 195p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC04-92AL82993. Order Number DE95014980. Source: OSTI; NTIS; GPO Dep.

This report is one in a series of 1994-1995 PVUSA reports that document PVUSA lessons learned at demonstration sites in California and Texas. During the last 7 years (1988 to 1994), 16 PV systems ranging from 20 kW to 500 kW have been installed. Six 20-kW emerging module technology (EMT) arrays and three turnkey (i.e., vendor designed and integrated) utility-scale systems were procured and installed at PVUSA's main test site in Davis, California. PVUSA host utilities have installed a total of seven EMT arrays and utility-scale systems in their service areas. Additional systems at Davis and host utility sites are planned. One of PVUSA's key objectives is to evaluate the performance, reliability, and cost of PV balance-of-system (BOS). In the procurement stage PVUSA encouraged innovative design to improve upon present practice by reducing maintenance, improving reliability, or lowering manufacturing or construction costs. The project team worked closely with suppliers during the design stage not only to ensure designs met functional and safety specifications, but to provide suggestions for improvement. This report, intended for the photovoltaic (PV) industry and for utility project managers and engineers considering PV plant construction and ownership, documents PVUSA utility-scale system design and cost lessons learned. Complementary PVUSA topical reports document: construction and safety experience; five-year assessment of EMTs; validation of the Kerman 500-kW grid-support PV plant benefits; PVUSA instrumentation and data analysis techniques; procurement, acceptance, and rating practices for PV power plants; experience with power conditioning units and power quality.

23482 (DOE/AL/82993–22) **Phase II – Photovoltaics for Utility Scale Applications (PVUSA). Progress report.** Pacific Gas and Electric Co., San Ramon, CA (United States). Dept. of Research and Development. Jun 1995. 177p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC04-92AL82993. Order Number DE95014977. Source: OSTI; NTIS; GPO Dep.

Photovoltaics for Utility Scale Applications (PVUSA) is a national public-private partnership that is assessing and demonstrating the viability of utility-scale (US) photovoltaic (PV) electric generation systems and recent developments in PV module technology. This report updates the project's progress, reviews the status and performance of the various PV installations during 1994, summarizes key accomplishments and conclusions for the year, and outlines future work. The PVUSA project has five objectives. These are designed to narrow the gap between a large utility industry that is unfamiliar with PV and a small PV industry that is aware of a potentially large utility market but unfamiliar with how to meet its requirements. The objectives are: Evaluate the performance, reliability, and cost of promising PV modules and balance-of-system (BOS) components side by side at a single location; Assess PV system operation and maintenance in a utility setting; Compare US utilities hands-on experience in designing, procuring, and operating PV systems; and, Document and disseminate knowledge gained from the project.

23483 (ETDE-BR–0005) **Numerical simulation of photovoltaic power plant interconnected to a grid of electric energy.** Lyra, Francisco Jose Maciel. Pernambuco Univ., Recife, PE (Brazil). Dept. de Energia Nuclear. Nov 1992. 248p. (In Portugese). Order Number DE95789949. Source: OSTI; NTIS (US Sales Only).

This work aims at the development of a model which simulates a photovoltaic power plant interconnected to the electrical grid. The analysis evaluates the system performance during a typical day of each month. Three configurations of flat solar panels have been studied: fixed, tracking the sun along a North/South axis that nay be tilted relative to the horizontal plane and a two axes tracker. The incident radiation of the panels is evaluated through correlations that transform daily values into instantaneous data, taking into account the statistical characteristics of the solar radiation and the anisotropy of the diffuse radiation. The optical characteristics of the module are analyzed based upon the physical properties of the optical means that make up the module, including multiple reflections. Cell temperature is computed by means of a model that considers the heating of the cell and module glass covering as well as the principal mechanism of heat transfer, particularly those of ambient convective losses and radiation exchange. The model of the IV characteristics curve of the photovoltaic module permits to obtain its electrical output for all operational conditions. Matching losses in module in module interconnection are also considered. Finally the efficiency of the power condition subsystem as well as its operational characteristics are obtained. Analyzing the results of the proposed models against those produced by PV-ISRAEL programs permit to conclude on the validation of the present model simulation. Based on the developed model a whole new range of information can be gained in design and evaluation of the photovoltaic power generation potential as well as an auxiliary tool in the study of experimental photovoltaic systems. (author). 61 refs, 58 figs, 35 tabs

23484 (ETDE-BR–0006) **Small scale irrigation system using a CEC photovoltaic generator. Technical and economic analysis.** Silva Fraga, Antonio Nelson da. Pernambuco Univ., Recife, PE (Brazil). Dept. de Energia Nuclear. Dec 1989. 135p. (In Portugese). Order Number DE95789950. Source: OSTI; NTIS (US Sales Only).

This work evaluates the benefits brought about by the use of low ratio concentrators coupled to photovoltaic generators. The main application looked for is water pumping for irrigation purposes. Optimization techniques looking for cost reduction are also developed with the aim of making this technology a viable alternative for small farmers. The concentrator studied is of the compound elastic type, an approximation of ideal non-focal concentrators (CPC). The reflector walls are simply obtained by the elastic deformation of a metallic sheet, fact which considerably simplify the construction procedure. A system of 500 W integrated by four modules of four cavities each, was built and tested. It was determined its electric and hydraulic performance and for comparison basis it was also tested a flat plate PV system. Both systems show a similar performance although the CEC-PV equipment has half the surface of photocells of the flat panel. A numerical simulation model of CEC-PV, CPC-PV and flat plate systems, used for irrigation purposes, was developed. The model considers the interaction of local climate, PV generator, moto-pump load, soil and crop subsystems. The maximum surface which can be irrigated by the three configurations analysed are: 1.43 ha, 1.41 ha and 1.38 ha for flat plate, CEC-PV and CPC-PV, respectively. Also the costs of electric energy, volume pumped and irrigated surface were obtained. The CEC-PV presents substantial benefits concerning electric energy and pumped water costs. The cost of the irrigated hectare shows smaller differences between the three systems studied mainly because the larger the total investment, the smaller the incidence of the cost reduction of the PV generator. 23485 (ETDE-DE–151) **Photovoltaic power supplies for environmental monitoring stations. Final report.** Schreitmueller, K.R.; Bermich, R.; Cornelius, C.; Decker, B.; Gentz, M. Institut fuer Solarenergieforschung GmbH, Emmerthal (Germany). Nov 1994. 69p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0329038A. Order Number DE95790557. Source: OSTI; NTIS (US Sales Only).

The conception of the photovoltaic supplied environmental monitoring station is in agreement with the Niedersaechsisches Landesamt fuer Oekologie, Forschungsstelle Kueste. In the first step the load energy demand (data acquisition unit, hydrological sensors for pressure and flow rate) is minimized. An important attempt is a load management, that reduces the switch-on periods of the sensors to a technically necessary extent. Because suitable hardware and software solutions are not available on the market, we develop a data acquisition and control device with low power demand. Due to the site of Norderney (North Sea coast of Lower

Saxony) and the corresponding solar radiation and load characteristics the autonomous photovoltaic power supply is designed by computer simulation. The selection and installation of components takes into account the specific site conditions (humidity, the tides, wind load). Several prototypes of the photovoltaic supplied environmental monitoring station are tested over a long time range. In the beginning we use a data storage, later a data transmission by the aid of a cordless telephone (C-Net). We develop an interface between the data acquisition and control device and the modem that is characterized by low power demand and switching capability due to modem and cordless telephone. The performed developments and prototype testings expand the area of application of autonomous photovoltaic supplied monitoring and control devices. (orig.)

23486 (ETDE-DE–166) **Climate-compatible energy supply in Baden-Wuerttemberg. Photovoltaic energy conversion - imports of solar electricity - hydrogen.** Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg. Arbeitsberichte, v. 17. Staiss, F. (Zentrum fuer Sonnenenergie- und Wasserstoff-Forschung (ZSW), Stuttgart (Germany)); Boehnisch, H.; Moesslein, J.; Pfisterer, F.; Stellbogen, D. Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg, Stuttgart (Germany). Apr 1994. 179p. (In German). Order Number DE95790277. Source: OSTI; NTIS (US Sales Only).

This brochure is one of the progress reports of the "Academy of Technology Assessment in Baden-Wuerttemberg". It discusses the work on photovoltaic electricity generation and on imports of hydrogen-based solar electricity: 1. Solar power generation - photovoltaic systems - 2. Imports of solar electricity. (orig.)

23487 (ETDE-DE–169) **Preparation and management of the One Thousand Roofs Programme in Lower Saxony. Final report.** Decker, B.; Grochowski, J.; Jahn, U.; Mencke, D.; Tegtmeyer, D. Institut fuer Solarenergieforschung GmbH, Emmerthal (Germany). Dec 1994. 60p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0329208A. Order Number DE95790555. Source: OSTI; NTIS (US Sales Only).

The German "One Thousand Roofs Programme" is supporting the installations of roof-mounted photovoltaic systems in order to demonstrate the use of roof tops for decentral photovoltaic energy production. The Federal Ministry for Research and Technologie and the State of Lower Saxony are supporting 176 grid connected photovoltaic systems on the roofs of single and two-family houses in Lower Saxony. The aim of this project is the administrative and technical preparation and project management of the "One Thousand Roofs Programme" in Lower Saxony. During this work, 380 applications for support have been sighted, 176 of which have been selected and approved for support and 172 photovoltaic systems with a total capacity of 391,6 kWp have been technically inspected. Furthermore, operating experiences from the installed projects in Lower Saxony are gathered and monitored performance data are collected and analysed. The accompanying monitoring and evaluation programme will provide in valuable information on the energy yields, system performance and operational failures of grid connected photovoltaic systems for future projects. 1407 Solar Thermal Power Systems

23488 (SAND–92-1449) **Design, fabrication, and testing of a sodium evaporator for the STM4-120 kinematic Stirling engine.** Rawlinson, K.S.; Adkins, D.R. Sandia National Labs., Albuquerque, NM (United States). May 1995. 122p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95015440. Source: OSTI; NTIS; GPO Dep.

This report describes the development and testing of a compact heat-pipe heat exchanger kW(e) designed to transfer thermal energy from hot combustion gases to the heater tubes of a 25-kW(e) Stirling engine. In this system, sodium evaporates from a surface that is heated by a stream of hot gases. The liquid metal then condenses on the heater tubes of a Stirling engine, where energy is transferred to the engine's helium working fluid. Tests on a prototype unit illustrated that a compact (8 cm x 13 cm x 16 cm) sodium evaporator can routinely transfer 15 kW(t) of energy at an operating vapor temperature of 760 C. Four of these prototype units were eventually used to power a 25-kW(e) Stirling engine system. Design details and test results from the prototype unit are presented in this report.

23489 (SAND–95-1106) **A nightly conditioning method to reduce parasitic power consumption in molten-salt central-receiver solar-power plants.** Pacheco, J.E. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950828–11: National heat transfer conference, Portland, OR (United States), 5-9 Aug 1995). Order Number DE95013030. Source: OSTI; NTIS; GPO Dep.

A method to reduce nightly parasitic power consumption in a molten salt central receiver is discussed where salt is drained from the piping and heat tracing is turned off to allow the piping to cool to ambient overnight, then in the morning the pipes are filled while they are cold. Since the piping and areas of the receiver in a molten-nitrate salt central-receiver solar power plant must be electrically heated to maintain their temperatures above the nitrate salt freezing point (430°F, 221°C), considerable energy could be used to maintain such temperatures during nightly shut down and bad weather. Experiments and analyses have been conducted to investigate cold filling receiver panels and piping as a way of reducing parasitic electrical power consumption and increasing the availability of the plant. The two major concerns with cold filling are: (1) how far can the molten salt penetrate cold piping before freezing closed and (2) what thermal stresses develop during the associated thermal shock. Experiments and analysis are discussed.

1409 Solar Thermal Utilization

23490 (ETDE-BR–0010) **Utilization of solar energy in the industry of ceramics for the drying process.** Bouckaert, Paul Henri Pimentel. Pernambuco Univ., Recife, PE (Brazil). Dept. de Energia Nuclear. Feb 1992. 151p. (In Portugese). Order Number DE95789954. Source: OSTI; NTIS (US Sales Only).

A solar system for brick drying used in ceramic industry is presented, consisting in a flat plate collector for air heating and a drying chamber. Some experiments for drying rate and critical moisture point determination are shown. Based in the experimental results, a simulation program is developed, considering the environmental conditions of temperature, relative air moisture and wind speed. The solar collectors of the proposed drying system are used for industrial drying of bricks, supplying air in suitable temperature to the process. 41 refs, 55 figs, 15 tabs

23491 (ETDE-DE–152) **Testing of simple solar preheaters with different auxiliary heating systems. Final report.** Schaube, H. Technischer Ueberwachungs-Verein Bayern Sachsen e.V., Muenchen (Germany). Zentralabteilung Energietechnische Anlagen und Systeme. Feb 1995. 109p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0329156D. Order Number DE95790893. Source: OSTI; NTIS (US Sales Only).

This study was a part of the researching project 'Solar und Sanitaer' (Nr. 0329156A), which was coordinated by 'Gesellschaft zur Foerderung der Heizungs- und Klimatechnik mbH'. (1) The reliability, safety and economic efficiency of seven low cost solar preheating systems have been tested during 20 months under real climatic conditions. (2) Four different auxiliary heating systems which have been connected to similar solar domestic hot water systems have been compared during a long term test. (3) The usability of five continuous flow heaters as auxiliary heating systems in solar domestic hot water systems was checked at a test facility where the special requirements for this purpose could be simulated. (HW)

23492 (ETDE-DE–165) **Climate-compatible energy supply in Baden-Wuerttemberg. Solar heat supply including industrial-scale heat storage facilities in Baden-Wuerttemberg.** Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg. Arbeitsberichte, v. 18. Nast, M. (Deutsche Forschungsanstalt fuer Luft- und Raumfahrt e.V. (DLR), Stuttgart (Germany). Inst. fuer

Technische Thermodynamik); Nitsch, J. Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg, Stuttgart (Germany). Apr 1994. 125p. (In German). Order Number DE95790276. Source: OSTI; NTIS (US Sales Only).

This brochure is one of the progress reports of the "Academy for Technology Assessment in Baden-Wuerttemberg". It reports on the project "Climate-compatible energy supply in Baden-Wuerttemberg". The report presents investigations of technologies for solar heat supply including industrial-scale solar heat storage systems: 1. Structural and energy-related basic data; 2. Reference technologies; Energy consumption during production and operation of the plant; 4. Potentials of solar thermal energy use; collector systems (assessment); 6. Obstacles to the introduction of solar thermal plants. (orig.)

23493 (ETDE-BR–0008) **Design, construction and performance analysis of a compound parabolic concentrator. Simulation and experimental results.** Leao, Paulo Cesar Abreu. Minas Gerais Univ., Belo Horizonte, MG (Brazil). Escola de Engenharia. Mar 1989. 82p. (In Portugese). Order Number DE95789952. Source: OSTI; NTIS (US Sales Only).

Models of compound parabolic concentrators (CPC) were designed, built and experimentally analyzed from the thermal point of view. Three configurations were considered: a CPC with a glass cover and a tubular glass envelope, a CPC without the envelope but with the cover, and a CPC without either envelope or cover. A mathematical model is proposed, containing modifications to analyze the thermal process of the CPC under a steady state condition with and without a not evacuated tubular envelope. The experimental results are compared to those obtained from the mathematical model. Simulations are carried out in order to achieve the optimization of the prototype. (author). 31 refs, 32 figs

23494 (DOE/AL/82993–12) **Magnetic field survey at PG&E photovoltaic sites.** Chang, G.J.; Jennings, C. Pacific Gas and Electric Co., San Ramon, CA (United States). Dept. of Research and Development. Aug 1994. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC04-92AL82993. Order Number DE95013806. Source: OSTI; NTIS; GPO Dep.

Public awareness has aroused concerns over the possible effects of magnetic fields on human health. While research continues to determine if magnetic fields do, in fact, affect human health, concerned individuals are requesting data on magnetic field sources in their environments to base personal decisions about limiting their exposure to these sources. Timely acceptance and implementation of photovoltaics (PV), particularly for distributed applications such as PV rooftops, windows, and vehicles, may be hampered by the lack of PV magnetic field data. To address this situation, magnetic flux density was measured around equipment at two PVUSA (Photovoltaics for Utility Scale Applications) project sites in Kerman and Davis, California. This report documents the data and compares the PV magnetic fields with published data on more prevalent magnetic field sources. Although not comprehensive, electric and magnetic field (EMF) data taken at PVUSA indicate that 60-Hz magnetic fields (the EMF type of greatest public concern) are significantly less for PV arrays than for household applications. Therefore, given the present EMF research knowledge, PV array EMF may not merit considerable concern. The PV system components exhibiting significant AC magnetic fields are the transformers and power conditioning units (PCUs). However, the AC magnetic fields associated with these components are localized and are not detected at PV system perimeters. Concern about transformer and PCU EMF would apply to several generation and storage technologies.

1502 Geology and Hydrology of Geothermal Systems

23495 (USGS-OFR–94-586) **Chemistry of spring and well waters on Kilauea Volcano, Hawaii, and vicinity.** Janik, C.J.; Nathenson, M.; Scholl, M.A. Geological Survey, Menlo Park, CA (United States). 1994. 166p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI05-93OR22089. Order Number DE95013085. Source: OSTI; NTIS; GPO Dep.

Published and new data for chemical and isotopic samples from wells and springs on Kilauea Volcano and vicinity are presented. These data are used to understand processes that determine the chemistry of dilute meteoric water, mixtures with sea water, and thermal water. Data for well and spring samples of non-thermal water indicate that mixing with sea water and dissolution of rock from weathering are the major processes that determine the composition of dissolved constituents in water. Data from coastal springs demonstrate that there is a large thermal system south of the lower east rift of Kilauea. Samples of thermal water from shallow wells in the lower east rift and vicinity have rather variable chemistry indicating that a number of processes operate in the near surface. Water sampled from the available deep wells is different in composition from the shallow thermal water, indicating that generally there is not a significant component of deep water in the shallow wells. Data for samples from available deep wells show significant gradients in chemistry and steam content of the reservoir fluid. These gradients are interpreted to indicate that the reservoir tapped by the existing wells is an evolving vapor-dominated system.

1506 Environmental Aspects

23496 (ORNL/TM–12863) **Environmental resources of selected areas of Hawaii: Ecological resources.** Trettin, C.C. (Oak Ridge National Lab., TN (United States). Environmental Sciences Div.); Tolbert, V.R.; Jones, A.T.; Smith, C.R.; Kalmijn, A.J. Oak Ridge National Lab., TN (United States). Mar 1995. 104p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95014186. Source: OSTI; NTIS; INIS; GPO Dep.

This report has been prepared to make available and archive the background scientific data and related information collected on ecological resources during the preparation of the environmental impact statement (EIS) for Phases 3 and 4 of the Hawaii Geothermal Project (HGP) as defined by the state of Hawaii in its April 1989 proposal to Congress. Since the state of Hawaii is no longer pursuing or planning to pursue the HGP, DOE considers the project to be terminated. The background scientific data and related information presented in this report focus on several areas of Hawaii County. In this report, reference is made to these areas as study areas rather than as areas where proposed or alternative facilities of the HGP would be located. The resource areas addressed herein include terrestrial ecology, aquatic ecology, and marine ecology. The scientific background data and related information that were obtained from review of the (1) scientific literature, (2) government and private sector reports, (3) studies done under DOE interagency agreements with the US Fish and Wildlife Service (FWS) and with the US Army Corps of Engineers (COE), and (4) observations made during site visits are being made available for future research in these areas.

1509 Geothermal Engineering

23497 (SAND–95-1289C) **Progress toward using hydraulic data to diagnose lost circulation zones.** Mansure, A.J.; Glowka, D.A. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951037–1: Annual meeting of the Geothermal Resources Council, Reno, NV (United States), 8-11 Oct 1995). Order Number DE95014851. Source: OSTI; NTIS; GPO Dep.

Several wellbore hydraulic models have been examined to determine their applicability in measuring the characteristics of lost circulation zones encountered in geothermal drilling. Characteristics such as vertical location in the wellbore, fracture size, effective permeability, and formation pressure must be known in order to optimize treatment of such zones. The models that have been examined to date are a steady-state model, a standpipe-pressure model, a raising-the-drill-bit model, a mud-weight model, a hydrofracture model, and several time-dependent models. None of these models yet have been found to adequately match the field data obtained from six loss zones in three geothermal wells. The development of these models is presented in this paper, and a discussion of their limitations is provided.

1520 Geothermal Data and Theory

23498 (CONF-950388–2) **Production and mitigation of acid chlorides in geothermal steam.** Simonson, J.M.; Palmer, D.A. Oak Ridge National Lab., TN (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States);Electric Power Research Inst., Palo Alto, CA (United States). DOE Contract AC05-84OR21400. From 13. geothermal program review; San Francisco, CA (United States); 13-16 Mar 1995. Order Number DE95013351. Source: OSTI; NTIS; GPO Dep.

Measurements of the equilibrium distribution of relatively nonvolatile solutes between aqueous liquid and vapor phases have been made at temperatures to 350°C for HCl(aq) and chloride salts. These data are directly applicable to problems of corrosive-steam production in geothermal steam systems. Compositions of high-temperature brines which could produce steam having given concentrations of chlorides may be estimated at various boiling temperatures. Effects of mitigation methods (e.g., desuperheating) can be calculated based on liquid-vapor equilibrium constants and solute mass balances under vapor-saturation conditions.

1540 Waste Management

23499 (BNL–61285) **Biochemical technology for the detoxification of geothermal brines and the recovery of trace metals.** Premuzic, E.T.; Lin, M.S.; Lian, Hsienjen. Brookhaven National Lab., Upton, NY (United States). May 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950955–1: 10. international conference on heavy metals in the environment, Hamburg (Germany), 18-22 Sep 1995). Order Number DE95011805. Source: OSTI; NTIS; GPO Dep.

Studies conducted at BNL, have shown that a cost-efficient and environmentally acceptable biochemical technology for detoxification of geothermal sludges is most satisfactory, as well as technically achievable. This technology is based on biochemical reactions by which certain extremophilic microorganisms interact with inorganic matrices of geothermal origin. The biochemical treatment of wastes generated by power plants using geothermal energy is a versatile technology adaptable to several applications beyond that of rendering hazardous and/or mixed wastes to non-hazardous by products, which meet regulatory requirements. This technology may be used for solubilization or recovery of a few metals to the isolation of many metals including radionuclides. In the metal recovery mode, an aqueous phase is generated which meets regulatory standards. The resulting concentrate contains valuable trace metals and salts which can be further converted into income generating products which can off-set the initial investment costs associated with the new biotechnology. In this paper, recent developments in this emerging technology will be discussed.

17 WIND ENERGY

1701 Resources and Availability (Climatology)

23500 (DOE/EIS–0206-App.C) **A cultural resources study of the proposed CARES Columbia Wind Farm No. 1, Klickatat County, Washington. Appendix C.** Galm, J.R.; Boreson, K.; Crisson, F.; Holstine, C. USDOE, Washington, DC (United States). Feb 1995. 21p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012242. Source: OSTI; NTIS; GPO Dep.

The purpose of this study is to conduct a cultural resources inventory to provide information for the environmental impact statement being jointly prepared by BPA and Klickatat County, Washington.

23501 (ETDE-BR–0012) **Probabilistic distributions of wind velocity for the evaluation of the wind power potential.** Vendramini, Elisa Zanuncio. UNESP, Botucatu, SP (Brazil). Faculdade de Ciencias Agronomicas. Oct 1986. 117p. (In Portugese). Order Number DE95789956. Source: OSTI; NTIS (US Sales Only).

The theoretical model of wind speed distributions allow valuable information about the probability of events relative to the variable in study eliminating the necessity of a new experiment. The most used distributions has been the Weibull and the Rayleigh. These distributions are examined in the present investigation, as well as the exponential, gamma, chi square and lognormal distributions. Three years of hourly averages wind data recorded from a anemometer setting at the city of Ataliba Leonel, Sao Paulo State, Brazil, were used. Using wind speed distribution the theoretical relative frequency was calculated from the distributions which have been examined. Results from the Kolmogorov - Smirnov test allow to conclude that the lognormal distribution fit better the wind speed data, followed by the gamma and Rayleigh distributions. Using the lognormal probability density function the yearly energy output from a wind generator installed in the side was calculated. 30 refs, 4 figs, 14 tabs

1705 Environmental Aspects

23502 (DOE/EIS–0206-App.B) **Columbia Wind Farm #1 EIS: Botanical resources technical report for the Conservation and Renewable Energy System. Appendix B.** Jones and Stokes Associates, Inc., Bellevue, WA (United States). 3 Feb 1995. 43p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012241. Source: OSTI; NTIS; INIS; GPO Dep.

Jones and Stokes Associates conducted botanical investigations of the Conservation and Renewable Energy Systems (CARES) project site from April through July 1994. Presurvey investigations were conducted to gain information regarding potential special-status plant species and vegetation communities that might exist on the project area. Field surveys were conducted to determine the presence of special-status plant species, map and describe potential vegetation communities, and document the presence of other species onsite, including culturally important species. Field surveys also were used to identify possible mitigation measures as a means to reduce potential project impacts to botanical resources. Floristically, the project area is located in the Columbia Basin Province dominated by shrub-steppe grassland vegetation. Completion of the presurvey and field investigations documented that the project area is dominated by native bunchgrass communities. Field surveys also determined that no special-status plant species were found on the study area. Implementation of the project would result in moderately significant impacts to the vegetation resource.

Impacts include the following direct impacts: removal or disturbance of approximately 38 hectares (95 acres) of vegetation, including 32 hectares (80 acres) of native, natural communities, from project construction and the initiation of development into relatively undisturbed native vegetation communities. Indirect impacts to vegetation are associated with impacts that could occur in the future. Ongoing activities that are required to maintain the site's function of producing wind power could result in vegetation trampling and removal of vegetation. This disturbance could create areas where invasive weeds could establish and provide a continual source of weed seed in the project area.

23503 (DOE/EIS–0206-App.D) **Avian use of proposed KENETECH and CARES wind farm sites in Klickitat County, Washington: Technical report. Appendix D.** Jones and Stokes Associates, Inc., Bellevue, WA (United States). 31 Jan 1995. 309p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012243. Source: OSTI; NTIS; INIS; GPO Dep.

The Columbia Hills area above (north of) the Columbia River in Klickitat County, in southcentral Washington, is being considered for development of two wind power generation projects that could include the eventual placement of up to 436 wind turbines. The KENETECH Windpower Washington Windplant™ Number 1 project would include placing up to 345 KENETECH 33M-VS turbines, capable of producing up to 115 megawatts (MW), in 39 rows (strings) on a 5,110-hectare (12,630-acre) site. The Conservation and Renewable Energy Systems (CARES) Columbia Wind Farm # 1 project would include placing 91 Flowind AWT-26 turbines, capable of generating 25 MW, in 11 rows on a 395-hectare (975-acre) site. During scoping for these proposed developments, concerns were raised regarding the potential for avian mortality associated with wind farm development. Collision with wind turbine blade, towers, guy wires, and transmission lines, and electrocution from power lines have been identified as sources of avian mortality, particularly raptors, at existing wind farm facilities. To address these concerns, an avian study was conducted at the site in accordance with an avian study plan and protocol developed, with input from a national avian task force, state agencies (Washington Department of Fish and Wildlife [WDFW]), and federal agencies (USFWS). The study included four elements: (1) a winter raptor and waterfowl study, (2) spring migration and fall migration studies, (3) a summer resident study, and (4) a raptor breeding study. The study involved extensive field studies conducted by biologists experienced in identifying raptors and other birds.

23504 (ETDE-DE–162) **Climate-compatible energy supply in Baden-Wuerttemberg. Wind power utilisation.** Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg. Arbeitsberichte, v. 19. Wiese, A. (Stuttgart Univ. (Germany). Inst. fuer Energiewirtschaft und Rationelle Energieanwendung (IER)); Albiger, J.; Kaltschmitt, M.; Fahl, U. Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg, Stuttgart (Germany). Apr 1994. 90p. (In German). Order Number DE95790274. Source: OSTI; NTIS (US Sales Only).

This brochure is one of the progress reports of the "Academy of Technology Assessment in Baden-Wuerttemberg". It attempts to point out the potential and limits of wind power in Baden-Wuerttemberg. In addition, the necessary technical, economic, ecological and other key data are made available for the projected scenario analysis which is based on the political goal of a 30% CO_2 reduction by the year 2005. 23505 (NREL/TP–441-7821) **A pilot golden eagle population study in the Altamont Pass Wind Resource Area, California.** Hunt, G. (California Univ., Santa Cruz, CA (United States). Predatory Bird Research Group). National Renewable Energy Lab., Golden, CO (United States); California Univ., Santa Cruz, CA (United States). Predatory Bird Research Group. May 1995. 219p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95009220. Source: OSTI; NTIS; GPO Dep.

Orloff and Flannery (1992) estimated that several hundred reports are annually killed by turbine collisions, wire strikes, and electrocutions at the Altamont Pass Wind Resource Area (WRA). The most common fatalities were those of red-tailed hawks (Buteo jamaicensis), American kestrels (Falco sparvatius), and golden eagles (Aquila chrysaetos), with lesser numbers of turkey vultures (Cathartes aura), common ravens (Corvus corax), barn owls (Tyto alba), and others. Among the species of raptors killed at Altamont Pass, the one whose local population is most likely to be impacted is the golden eagle. Besides its being less abundant than the others, the breeding and recruitment rates of golden eagles are naturally slow, increasing their susceptibility to decline as a result of mortality influences. The golden eagle is a species afforded special federal protection because of its inclusion within the Bald Eagle Protection Act as amended in 1963. There are no provisions within the Act which would allow the killing "taking" of golden eagles by WRA structures. This report details the results of field studies conducted during 19941. The primary purpose of the investigation is to lay the groundwork for determining whether or not turbine strikes and other hazards related to energy at Altamont Pass may be expected to affect golden eagles on a population basis. We also seek an understanding of the physical and biotic circumstances which attract golden eagles to the WRA within the context of the surrounding landscape and the conditions under which they are killed by wind turbines. Such knowledge may suggest turbine-related or habitat modifications that would result in a lower incidence of eagle mortality.

1706 Wind Energy Engineering

23506 (ETDE-DE–108) **Wind power in Berlin.** BEWAG Fachreport, v. 1994/1. Kraemer, K.; Pokojski, M. Berliner Kraft- und Licht (BEWAG)-AG, Berlin (Germany). Mar 1994. 8p. (In German). Order Number DE95778125. Source: OSTI; NTIS (US Sales Only).

The brochure describes a wind power project. The wind converter has two asynchronous generators of 6 kW and 30 kW, respectively. It is located on a landfill site near Berlin. The power generation per month is presented in a diagram. (orig.)

23507 (NREL/TP–441-7808) **Optimizing small wind turbine performance in battery charging applications.** Drouilhet, S. (National Renewable Energy Lab., Golden, CO (United States). Wind Technology Div.); Muljadi, E.; Holz, R.; Gevorgian, V. National Renewable Energy Lab., Golden, CO (United States). May 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. (CONF-950309–8: 25. annual conference and exhibition on wind power, Washington, DC (United States), 26-30 Mar 1995). Order Number DE95009211. Source: OSTI; NTIS; GPO Dep.

Many small wind turbine generators (10 kW or less) consist of a variable speed rotor driving a permanent magnet synchronous generator (alternator). One application of such wind turbines is battery charging, in which the generator is connected through a rectifier to a battery bank. The wind turbine electrical interface is essentially the same whether the turbine is part of a remote power supply for telecommunications, a standalone residential power system, or a hybrid village power system, in short, any system in which the wind generator output is rectified and fed into a DC bus. Field experience with such applications has shown that both the peak power output and the total energy capture of the wind turbine often fall short of expectations based on rotor size and generator rating. In this paper, the authors present a simple analytical model of the typical wind generator battery charging system that allows one to calculate actual power curves if the generator and rotor properties are known. The model clearly illustrates how the load characteristics affect the generator output. In the second part of this paper, the authors present four approaches to maximizing energy capture from wind turbines in battery charging applications. The first of these is to determine the optimal battery bank voltage for a given WTG. The second consists of adding capacitors in series with the generator. The third approach is to place an optimizing DC/DC voltage converter between the rectifier and the battery bank. The fourth is a combination of the series capacitors and the optimizing voltage controller. They also discuss both the limitations and the potential performance gain associated with each of the four configurations.

23508 (NREL/TP–442-7110) **Advanced system identification techniques for wind turbine structures with special**

emphasis on modal parameters. Bialasiewicz, J.T. National Renewable Energy Lab., Golden, CO (United States). Jun 1995. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95009251. Source: OSTI; NTIS; GPO Dep.

The goal of this research is to develop advanced system identification techniques that can be used to accurately measure the frequency response functions of a wind-turbine structure immersed in wind noise. To allow for accurate identification, the authors have developed a special test signal called the Pseudo-Random Binary Sequence (PRBS). The Matlab program that generates this signal allows the user to interactively tailor its parameters for the frequency range of interest based on the response of the wind turbine under test. By controlling NREL's Mobile Hydraulic Shaker System, which is attached to the wind turbine structure, the PRBS signal produces the wide-band excitation necessary to perform system identification in the presence of wind noise. The techniques presented here will enable researchers to obtain modal parameters from an operating wind turbine, including frequencies, damping coefficients, and mode shapes. More importantly, the algorithms they have developed and tested (so far using input-output data from a simulated structure) permit state-space representation of the system under test, particularly the modal state space representation. This is the only system description that reveals the internal behavior the system, such as the interaction between the physical parameters, and which, in contrast to transfer functions, is valid for non-zero initial conditions.

23509 (NREL/TP–442-7812) **Guidelines for reducing dynamic loads in two-bladed teetering-hub downwind wind turbines.** Wright, A.D.; Bir, G.S.; Butterfield, C.D. National Renewable Energy Lab., Golden, CO (United States). Jun 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95009252. Source: OSTI; NTIS; GPO Dep.

A major goal of the federal Wind Energy Program is the rapid development and validation of structural models to determine loads and response for a wide variety of different wind turbine configurations operating under extreme conditions. Such codes are crucial to the successful design of future advanced wind turbines. In previous papers the authors described steps they took to develop a model of a two-bladed teetering-hub downwind wind turbine using ADAMS® (Automatic Dynamic Analysis of Mechanical Systems), as well as comparison of model predictions to test data. In this paper they show the use of this analytical model to study the influence of various turbine parameters on predicted system loads. They concentrate their study on turbine response in the frequency range of six to ten times the rotor rotational frequency (6P to 10P). Their goal is to identify the most important parameters which influence the response of this type of machine in this frequency range and give turbine designers some general design guidelines for designing two-bladed teetering-hub machines to be less susceptible to vibration. They study the effects of such parameters as blade edgewise and flapwise stiffness, tower top stiffness, blade tip-brake mass, low-speed shaft stiffness, nacelle mass momenta of inertia, and rotor speed. They show which parameters can be varied in order to make the turbine less responsive to such atmospheric inputs as wind shear and tower shadow. They then give designers a set of design guidelines in order to show how these machines can be designed to be less responsive to these inputs.

23510 (NREL/TP–442-7813) **Development of an advanced system identification technique for comparing ADAMS analytical results with modal test data for a MICON 65/13 wind turbine.** Bialasiewicz, J.T. National Renewable Energy Lab., Golden, CO (United States). Jul 1995. 107p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95009260. Source: OSTI; NTIS; GPO Dep.

This work uses the theory developed in NREL/TP–442-7110 to analyze simulated data from an ADAMS (Automated Dynamic Analysis of Mechanical Systems) model of the MICON 65/13 wind turbine. The Observer/Kalman Filter identification approach is expanded to use input-output time histories from ADAMS simulations or structural test data. A step by step outline is offered on how the tools developed in this research, can be used for validation of the ADAMS model.

23511 (PNL–10630) **A simple method of estimating wind turbine blade fatigue at potential wind turbine sites.** Barnard, J.C.; Wendell, L.L. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015265. Source: OSTI; NTIS; GPO Dep.

This paper presents a technique of estimating blade fatigue damage at potential wind turbine sites. The cornerstone of this technique is a simple model for the blade's root flap bending moment. The model requires as input a simple set of wind measurements which may be obtained as part of a routine site characterization study. By using the model to simulate a time series of the root flap bending moment, fatigue damage rates may be estimated. The technique is evaluated by comparing these estimates with damage estimates derived from actual bending moment data; the agreement between the two is quite good. The simple connection between wind measurements and fatigue provided by the model now allows one to readily discriminate between damaging and more benign wind environments.

Order Number DE95011613. Source: OSTI; NTIS; GPO Dep.

It's clear that turbomachinery poses a set of unique problems for risk managers. The size of the equipment, the role it often takes in production and the severity of a loss all combine to make a risk manager's job that much more difficult. But while the job may be difficult, it's not impossible. Through a combination of advanced technology, regular predictive maintenance and some expert advice, today's risk managers, working with plant operational personnel, are reducing major turbomachinery losses. There are several telltale signs that warn plant personnel of an impending turbomachinery failure. One is vibration. All turbomachinery will vibrate at some level, even when in good working condition. But a change in the vibration level usually indicates a change in the machine's performance. If plant personnel can detect a change early enough, they may be able to avoid an unscheduled shutdown. Hartford Steam Boiler recently introduced a periodic vibration data collection program called DATALERT™ to help its customers separate problem from non-problem machines. As a result, companies can focus resources on equipment that needs immediate attention. And equipment in good working condition doesn't tie up resources unnecessarily at the next maintenance turnaround. DATALERT is an integrated machinery vibration data collecting and expert analysis system developed by Hartford Steam Boiler to assist customers in preventing rotating machine downtime or losses. The data collection program is described.

23513 (CONF-941089–Vol.2, pp. 899-966) **Electric utility system benefits of factory packaged GE LM Modular Generator sets.** West, G. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 2.* 607p. Order Number DE95011613. Source: OSTI; NTIS; GPO Dep.

Electric utility system benefits of factory packaged GE LM modular generator sets are outlined. The following topics are discussed: GE LM gas turbine history, operating experience, maintenance, gas turbine spare engines, modular gas turbine generator sets, typical LM2500 cogeneration plant and STIG cycle plant, factory packaging concept, gas turbine/generator package, performance, comparison, competitive capital cost, phased construction, comparison of revenue requirements, capacity evaluation, heat rate evaluation, fuel evaluation, startup, and dispatch flexibility without maintenance penalty.

23514 (CONF-950564–9) **The plant-window system.** Wood, R.T. (Oak Ridge National Lab., TN (United States)); Mullens, J.A.; Naser, J.A. Oak Ridge National Lab., TN (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States);Electric Power Research Inst., Palo Alto, CA (United States). DOE Contract AC05-84OR21400. Power plant data, and the information that can be derived from it, provide the link to the plant through which the operations, maintenance and engineering staff understand and manage plant performance. The increasing use of computer technology in the U.S. nuclear power industry has greatly expanded the capability to obtain, analyze, and present data about the plant to station personnel. However, it is necessary to transform the vast quantity of available data into clear, concise, and coherent information that can be readily accessed and used throughout the plant. This need can be met by an integrated computer workstation environment that provides the necessary information and software applications, in a manner that can be easily understood and used, to the proper users throughout the plant. As part of a Cooperative Research and Development Agreement with the Electric Power Research Institute, the Oak Ridge National Laboratory has developed functional requirements for a Plant-Wide Integrated Environment Distributed On Workstations (Plant-Window) System. The Plant-Window System (PWS) can serve the needs of operations, engineering, and maintenance personnel at nuclear power stations by providing integrated data and software applications (e.g., monitoring, analysis, diagnosis, and control applications) within a common environment. The PWS requirements identify functional capabilities and provide guidelines for standardized hardware, software, and display interfaces to define a flexible computer environment that permits a tailored implementation of workstation capabilities and facilitates future upgrades.

23515 (DOE/EE/15623–T1) **Clean energy from municipal solid waste. ERIP technical progress report No. 1.** Klosky, M. EnerTech Environmental, Inc., Atlanta, GA (United States). Engineering Group. 14 Jul 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-95EE15623. Order Number DE95014975. Source: OSTI; NTIS; GPO Dep.

Just prior to this award and reporting period but as part of this program, EnerTech initiated preliminary pilot scale slurry carbonization experiments with Refuse Derived Fuel (RDF) and preliminary pilot scale combustion experiments with the carbonized RDF slurry fuel. For this award and the time period April 1995–July 1995, several modifications to the pilot plant facilities were completed to improve operational reliability, system performance, and characteristics of the carbonized slurry fuel, based upon the previous plant experiments.

23516 (DOE/MC/29309–4056) **Tracy Power Station – Unit No. 4, Pinon Pine Power Project Public Design Report.** Sierra Pacific Power Co., Reno, NV (United States). Dec 1994. 183p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-92MC29309. Order Number DE95009708. Source: OSTI; NTIS; GPO Dep.

This Public Design Report describes the Pinon Pine Project which will be located at the Sierra Pacific Power Company's (SPPCO) Tracy Station near Reno, Nevada. The integrated gasification combined-cycle (IGCC) plant is designed to process 880 tones per day (TPD) of bituminous coal producing approximately 107 gross megawatts of electric power (MWe). This project is receiving cost-sharing from the US Department of Energy (DOE) in accordance with DOE Cooperative Agreement DE-FC2192MC29309. The plant incorporates the Kellogg-Rust-Westinghouse (KRW) fluidized bed gasification technology which produces a low-Btu gas which is used as fuel in a combined cycle power plant which has been modified to accommodate the fuel gas produced by an air-blown gasifier. The gasification system also includes hot gas removal of particulates and sulfur compounds from the fuel gas resulting in a plant with exceptionally low atmospheric emissions. Desulfurization is accomplished by a combination of limestone injection into the KRW fluidized bed gasifier and by a transport reactor system. Particulate removal is accomplished by high efficiency cyclones and a barrier filter. The Pinon Pine Project Schedule is divided into three phases. Phase I includes permitting and preliminary design. Phase II, which overlaps Phase I, covers detailed design, procurement, and construction. Phase III will cover the initial operation and demonstration portion of the project.

23517 (DOE/MC/29309–4063) **Pinon Pine Power Project. Annual report, August 1992–December 1993.** Sierra Pacific Power Co., Reno, NV (United States). Nov 1994. 73p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-92MC29309. Order Number DE95009709. Source: OSTI; NTIS; GPO Dep.

This annual report has been prepared to present the status of the Pinon Pine Power Project, a nominal 104 MWe (gross) integrated gasification combined-cycle (IGCC) power plant addition to Sierra Pacific Power Company's (SPPCo) system. This project will also serve as a demonstration project cost-shared by the US Department of Energy (DOE) and SPPCo under DOE's Clean Coal Technology (CCT) Program. The goal of the CCT Program is to demonstrate advanced coal utilization technologies that are energy efficient and reliable and that are able to achieve substantial reductions in emissions as compared with existing coal technologies. The Pinon Pine Power Project will demonstrate an IGCC system utilizing the Kellogg-Rust-Westinghouse (KRW) fluidized-bed gasification process operating in an air-blown mode with in-bed desulfurization and hot gas clean-up with a western bituminous coal. The Pinon Pine Power Project will be constructed and operated at SPPCo's Tracy Power Station, an existing power generation facility located on a rural 724-acre plot approximately 17 miles east of Reno, NV.

23518 (DOE/MC/31327–95/C0451) **Externally-fired combined cycle: An effective coal fueled technology for repowering and new generation.** Stoddard, L.E. (Black and Veatch, Kansas City, MO (United States)); Bary, M.R.; Gray, K.M.; LaHaye, P.G. Black and Veatch, Kansas City, MO (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-94MC31327. (CONF-950313–2: 20. international technical conference on coal utilization and fuels systems, Clearwater, FL (United States), 20-23 Mar 1995). Order Number DE95012295. Source: OSTI; NTIS; GPO Dep.

The Externally-Fired Combined Cycle (EFCC) is an attractive emerging technology for powering high efficiency combined gas and steam turbine cycles with coal or other ash bearing fuels. In the EFCC, the heat input to a gas turbine is supplied indirectly through a ceramic air heater. The air heater, along with an atmospheric coal combustor and ancillary equipment, replaces the conventional gas turbine combustor. A steam generator located downstream from the ceramic air heater and steam turbine cycle, along with an exhaust cleanup system, completes the combined cycle. A key element of the EFCC Development Program, the 25 MMBtu/h heat-input Kennebunk Test Facility (KTF), has recently begun operation. The KTF has been operating with natural gas and will begin operating with coal in early 1995. The US Department of Energy selected an EFCC repowering of the Pennsylvania Electric Company's Warren Station for funding under the Clean Coal Technology Program Round V. The project focuses on repowering an existing 48 MW (gross) steam turbine with an EFCC power island incorporating a 30 MW gas turbine, for a gross power output of 78 MW and a net output of 72 MW. The net plant heat rate will be decreased by approximately 30% to below 9,700 Btu/kWh. Use of a dry scrubber and fabric filter will reduce sulfur dioxide (SO_2) and particulate emissions to levels under those required by the Clean Air Act Amendments (CAAA) of 1990. Nitrogen

oxides (NO_x) emissions are controlled by the use of staged combustion. The demonstration project is currently in the engineering phase, with startup scheduled for 1997. This paper discusses the background of the EFCC, the KTF, the Warren Station EFCC Clean Coal Technology Demonstration Project, the commercial plant concept, and the market potential for the EFCC.

23519 (DOE/PC/91155–T10) **Coal-fired high performance power generating system. Quarterly progress report, October 1, 1994–December 31, 1994.** United Technologies Corp., East Hartford, CT (United States). Research Center. [1995]. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC91155. Order Number DE95015617. Source: OSTI; NTIS; GPO Dep.

This report covers work carried out under Task 3, Preliminary R and D, under contract DE-AC22-92PC91155, "Engineering Development of a Coal-Fired High Performance Power Generation System" between DOE Pittsburgh Energy Technology Center and United Technologies Research Center. The goals of the program are to develop a coal-fired high performance power generation system (HIPPS) by the year 2000 that is capable of (1) > 47% thermal efficiency; (2) NO_x, SO_x and particulates $\leq$25% NSPS; (3) cost $\geq$65% of heat input; (4) all solid wastes benign. In our design consideration, we have tried to render all waste streams benign and if possible convert them to a commercial product. It appears that vitrified slag has commercial values. If the flyash is reinjected through the furnace, along with the dry bottom ash, then the amount of the less valuable solid waste stream (ash) can be minimized. A limitation on this procedure arises if it results in the buildup of toxic metal concentrations in either the slag, the flyash or other APCD components. We have assembled analytical tools to describe the progress of specific toxic metals in our system. The outline of the analytical procedure is presented in the first section of this report. The strengths and corrosion resistance of five candidate refractories have been studied in this quarter. Some of the results are presented and compared for selected preparation conditions (mixing, drying time and drying temperatures). A 100 hour pilot-scale stagging combustor test of the prototype radiant panel is being planned. Several potential refractory brick materials are under review and five will be selected for the first 100 hour test. The design of the prototype panel is presented along with some of the test requirements.

23520 (ANL/ES/CP–84609) **Development of dry control technology for emissions of mercury in flue gas.** Huang, Hann S.; Wu, Jiann M.; Livengood, C.D. Argonne National Lab., IL (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950647–1: 4. international congress on toxic combustion byproducts, Berkeley, CA (United States), 5-7 Jun 1995). Order Number DE95013530. Source: OSTI; NTIS; GPO Dep.

In flue gases from coal-combustion systems, mercury in either the elemental state or its chloride form ($HgCl_2$) can be predominant among all the possible mercury species present; this predominance largely depends on the chlorine-to-mercury ratio in the coal feeds. Conventional flue-gas cleanup technologies are moderately effective in controlling $HgCl_2$ but are very poor at controlling elemental mercury. Experiments were conducted on the removal of elemental mercury vapor by means of a number of different types of sorbents, using a fixed-bed adsorption system. Of the four commercial activated carbons evaluated, the sulfur-treated carbon sample gives the best removal performance, with good mercury-sorption capacities. Promising removal results also have been obtained with low-cost minerals after chemical treatments. These inorganic sorbents could potentially be developed into a cost-effective alternative to activated carbons for mercury removal.

23521 (CONF-9410335–, pp. 258-271) **Reducing NO_x emissions and improving efficiency using synthetic intelligence to manage boiler parameters.** Moreno, C.W. (Ultramax Corporation, Cincinnati, OH (United States)); Yunker, S.B. USDOE Pittsburgh Energy Technology Center, PA (United States); Oregon State Univ., Corvallis, OR (United States). Dept. of Computer Science; Naval Research Lab., Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States); Bureau of Mines, Washington, DC (United States). [1994]. From Adaptive control systems technology symposium; Pittsburgh, PA (United States); 24-25 Oct 1994. In *High-tech controls for energy and environment. Proceedings.* 287p. Order Number DE95011702. Source: OSTI; NTIS; GPO Dep.

Existing fossil-fired electric power generation systems can operate with significantly lower levels of NO_x and other undesirable emissions, while maintaining or improving heat rate, by optimizing adjustments to the input/control parameters of the combustion system. This is being achieved in about ten shifts of regular operations with Sequential Process Optimization (SPO) technology, without capital expenditures, historical data or prior models. As measurements or calculations of critical outputs are available, SPO sequentially provides advices for adjustment to input parameters in order to converge toward the optimum, and thereafter maintain it. The ULTRAMAX SPO is based on unique statistical and mathematical methods to sequentially: (1) generate new knowledge (prediction models for all outputs) from sequential operating data, and (2) sequentially define new input adjustments through synthesis with the integration of these models, to achieve overall process performance improvements. The SPO Technology is part of the ULTRAMAX Method, which includes a complete strategy for achieving multiple objectives tailored to fit the specifics of each operation, and defining personnel procedures. At an engineering level it provides for sensitivity analyses to understand certain bottlenecks which may be worth resolving through retrofits. This solution, in part co-developed by EPRI, was introduced into the power industry in late '93 after a variety of validation studies. Since then there have been a series of commercial applications with U.S. utility companies, where ROI's have been in the order of one month. Six case studies are presented which have various combinations of objectives such as reduction in NO_x, CO, opacity, LOI and Heat Rates.

23522 (DOE/PC/91338–T10) **High SO_2 removal efficiency testing.** Radian Corp., Austin, TX (United States). 10 Mar 1995. 156p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC91338. Order Number DE95016678. Source: OSTI; NTIS; GPO Dep.

Tests were conducted on the Tampa Electric Company's (TECo) Big Bend Station, Unit 4 flue gas desulfurization (FGD) system to evaluate an option for achieving high sulfur dioxide (SO_2) removal efficiencies. The option tested was the addition of dibasic acid (DBA) additive. In addition, the effectiveness of other potential options was simulated with the Electric Power Research Institute's (EPRI) FGD PRocess Integration and Simulation Model (FGDPRISM) after it was calibrated to the system. An economic analysis was conducted to determine the cost effectiveness of each option considered.

23523 (DOE/PC/91344–T11) **Advanced separation technology for flue gas cleanup. Quarterly technical report Number 12.** Bhown, A.S. (SRI International, Menlo Park, CA (United States)); Alvarado, D.; Pakala, N.; Riggs, T.; Tagg, T.; Ventura, S.; Sirkar, K.K.; Majumdar, S.; Bhaumick, D. SRI International, Menlo Park, CA (United States). Apr 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC91344. Order Number DE95014328. Source: OSTI; NTIS; GPO Dep.

The objective of this work is to develop a novel system for regenerable SO_2 and NO_x scrubbing of flue gas that focuses on (a) a novel method for regeneration of spent SO_2 scrubbing liquor and (b) novel chemistry for reversible absorption of NO_x. In addition, high efficiency hollow fiber contactors (BFC) are proposed as the devices for scrubbing the SO_2 and NO_x from the flue gas. The system will be designed to remove more than 95% of the SO_x and more than 75% of the NO_x from flue gases typical of pulverized coal-fired power plants at a cost that is at least 20% less than combined wet limestone scrubbing of SO_x and selective catalytic reduction of NO_x. In addition, the process will make only marketable byproducts, if any (no waste streams). During the first

quarter of 1995, the authors continued work on Task 8, and also began working on Task 9. In Task 8, they have presented the modified experimental arrangement for testing the efficacy of Co(II)-phthalocyanine solution for NO_x absorption as well as desorption over extended periods of time. The key feature of this new experimental setup is to continuously circulate the warm Co(II)-phthalocyanine solution (using a computer) through the HFC in order to avoid precipitation within the fibers. Also, this arrangement allows one to automatically acquire process data. In Task 9, the authors carried out preliminary design calculations to determine the performance of a rectangular module that will be supplied by Setec. Also, they designed and constructed the apparatus for testing these modules.

23524 (DOE/PC/91346–10) **Development of the integrated environmental control model: Performance model for the NOXSO process. Quarterly progress report.** Kalagnanam, J.R.; Rubin, E.S. Carnegie-Mellon Univ., Pittsburgh, PA (United States). Center for Energy and Environmental Studies. Apr 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC91346. Order Number DE95015602. Source: OSTI; NTIS; GPO Dep.

In its current configuration, the IECM provides a capability to model various conventional and advanced processes for controlling air pollutant emissions from coal-fired power plants before, during, or after combustion. The principal purpose of the model is to calculate the performance, emissions, and cost of power plant configurations employing alternative environmental control methods. The model consists of various control technology modules, which may be integrated into a complete utility plant in any desired combination. In contrast to conventional deterministic models, the IECM offers the unique capability to assign probabilistic values to all model input parameters, and to obtain probabilistic outputs in the form of cumulative distribution functions indicating the likelihood of different costs and performance results. The most recent version of the IECM, implemented on a MacIntosh II computer, was delivered to DOE/PETC at the end of the last contract in May 1991. The current contract will continue the model development effort to provide DOE/PETC with improved model capabilities, including new software developments to facilitate model use and new technical capabilities for analysis of environmental control technologies. Integrated environmental control systems involving pre-combustion, combustion, and post-combustion control methods will be considered. Phase I involves developing the existing modules of the IECM. Phase II deals with creating new technology modules, linking the IECM with PETC databases, and training PETC personnel on the use of the updated models. The present report summarizes recent progress on the Phase I effort during the period January 1 - March 31, 1995. A preliminary summary is given of the new performance model developed for the NOXSO process. The performance model is developed from first principles and parametrized based on experimental data from pilot plants.

23525 (OCDO–95012719) **Development of advanced, dry, SO_x/NO_x emission control technologies for high-sulfur coal. Final report, April 1, 1993–December 31, 1994.** Amrhein, G.T. Babcock and Wilcox Co., Alliance, OH (United States). 23 Dec 1994. 89p. Sponsored by Ohio State Government, Columbus, OH (United States). Source: OSTI; Ohio Coal Development Office, 77 S. High Street, P.O. Box 1001, Columbus, OH 43266-0001 (United States).

Dry Scrubbing is a common commercial process that has been limited to low- and medium-sulfur coal applications because high-sulfur coal requires more reagent than can be efficiently injected into the process. Babcock & Wilcox has made several advances that extend dry scrubbing technologies to higher sulfur coals by allowing deposit-free operation at low scrubber exit temperatures. This not only increases the amount of reagent that can be injected into the scrubber, but also increases SO_2 removal efficiency and sorbent utilization. The objectives of this project were to demonstrate, at pilot scale, that advanced, dry-scrubbing-based technologies can attain the performance levels specified by the 1990 Clean Air Act Amendments for SO_2 and NO_x emissions while burning high-sulfur coal, and that these technologies are economically competitive with wet scrubber systems. The use of these technologies by utilities in and around Ohio, on new or retrofit applications, will ensure the future of markets for high-sulfur coal by creating cost effective options to coal switching.

23526 (CONF-941089–Vol.2, pp. 711-760) **Competitive power development.** Garrity, T.F. (GE Power Systems Engineering, Schenectady, NY (United States)); Stoll, H.G. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 2.* 607p. Order Number DE95011613. Source: OSTI; NTIS; GPO Dep.

Electric power is essential to economic growth and the improvement in the standard of living in modern societies. Maximizing the overall economic efficiency of electric power production can lead to even stronger economic growth. Overall electricity efficiency can be driven by utilization of the newest and most economically efficient technologies, utilization of the most efficient financial structuring, and efficient integration of coproduction of electricity and process energy. The challenge is to drive the power generation strategy toward maximum economic efficiency while improving the overall country environment emissions. This paper reviews the key power generation technologies available today and in the near future. Of key importance is the capital cost, efficiency, environmental impacts, and reliability of each technology and how these technologies can be integrated with efficient financial structurings to maximize the country power generation economic efficiency. Examples of several countries are used to show recent successes in maximizing economic efficiency.

23527 (CONF-941089–Vol.2, pp. 761-776) **HANJUNG's overseas marketing for power industry.** Cho, B.K. (Korea Heavy Industries and Construction Co., Ltd., Hanjung (Korea, Democratic People's Republic of)). USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 2.* 607p. Order Number DE95011613. Source: OSTI; NTIS; GPO Dep.

The Korean government has a strong policy for developing local industries for producing power plant facilities. Korea Heavy Industries and Construction Co. Ltd. (HANJUNG) is a prime contractor for the design, construction, and installation of power plant facilities. The following topics are discussed: history of the electric power in Korea, the fabrication and supply of power plants in Korea, changing factors of the power plant business around the world, HANJUNG's overseas marketing strategy, and Korea-US cooperation in third world countries.

23528 (CONF-941089–Vol.2, pp. 777-782) **Globalizing core business strategies for U.S. utilities.** Weidenbach, W.H. Jr. (Weidenbach & Associates, Inc., Atlanta, GA (United States)). USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 2.* 607p. Order Number DE95011613. Source: OSTI; NTIS; GPO Dep.

Good afternoon. I am honored to be here today and consider it a privilege to be a part of such a forum. I'd like to talk about changes that have taken place in the U.S. electric utility industry–changes that have helped promote the evolution of the independent power industry. My talk today will involve a brief history of the U.S. electric generating industry, addressing legislation and issues that affect the emerging independent power industry. Just a few years ago, electric utilities in the U.S. were experiencing very fast growth

building many new, large, state-of-the-art generating plants. Issues such as the oil embargo, regulation and public opinion made it necessary for many of these companies to move predominately to coal-fired plants while completing their nuclear programs. In additions to developing the proven, reliable and efficient operating skills for these plants, this was also a period of building strong financial posture for these companies adding to their credentials. The lower growth rate that prevails today for U.S. utilities is allowing new strength to be developed in areas such as Demand Side Management and Integrated Resource Planning. These skills have also prepared U.S. companies to expand their market opportunities. Recent regulatory changes now allow these companies to expand their core business strengths to market in the non-regulated arena both domestically and internationally. Privatization of existing facilities have offered almost instant equity an operational opportunities for these companies both at home and throughout the world. Now that major growth is in other areas-particularly in Asia, U.S. companies are quite interested in bringing their skills and capabilities to bear in these fast growing areas of opportunity. This proven experience, exceptional financial strength and entrepreneurial spirit make these companies great partnership opportunities for existing and future generating facilities.

23529 (CONF-941089–Vol.2, pp. 783-818) **Experience in independent power production: Two projects that closed.** Kappaz, M.H. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 2.* 607p. Order Number DE95011613. Source: OSTI; NTIS; GPO Dep.

K and M Engineering and Consulting Corporation's experience in independent power production is outlined. The following topics are discussed: the KMR Power Corporation, K and M strengths and strategy, key success factors, project experience, selected projects, and capital structure.

23530 (CONF-941089–Vol.2, pp. 819-830) **Power plant engineering for overseas market.** Chun, K.S. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 2.* 607p. Order Number DE95011613. Source: OSTI; NTIS; GPO Dep.

Korea's experience in power plant engineering for the overseas market is reviewed. The following topics are discussed: the Asian electric power market, ordering characteristics, country situations, and overseas market requirements.

23531 (CONF-941089–Vol.2, pp. 831-839) **A U.S. utilities perspective of foreign investments.** White, M.; Imsdahl, B. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 2.* 607p. Order Number DE95011613. Source: OSTI; NTIS; GPO Dep.

This paper reviews what MDU Resources Group, Inc. will use for criteria to evaluate investment opportunities in foreign countries and the strategy it has developed for foreign investments. The paper further outlines what MDU Resources Group, Inc. considers critical to make an investment in an international project.

23532 (CONF-941089–Vol.2, pp. 841-857) **Consortium formation for a coal-fired power plant in the People's Republic of China.** Kostal, K.T. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 2.* 607p. Order Number DE95011613. Source: OSTI; NTIS; GPO Dep.

The advent of developed power projects within the People's Republic of China brings the benefits of new financing methods and the energies and resources of new participants. By necessity, it also results in fundamental changes in the many contractual relationships needed to support financial closing. The key element is the contract to design, procure, and construct the power plant. This paper compares and contrasts the requirements of these turnkey contracts with more traditional fixed price equipment supply contracts within the People's Republic of China. The emphasis of the paper is upon issues and concerns related to the successful formation of a consortium, including the effective integration of Chinese construction companies and design institutes into the process. The issues are explored from the viewpoint of the consortium's international engineer, who often participates as consortium leader and equipment procurer, in addition to detailed designer.

23533 (CONF-941089–Vol.2, pp. 967-1039) **Integrated resource planning-concepts and principles.** Atkinson, S. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 2.* 607p. Order Number DE95011613. Source: OSTI; NTIS; GPO Dep.

The concepts and principles of integrated resource planning (IRP) are outlined. The following topics are discussed: utility opportunities and methodologies, application considerations, ambitious energy-efficient programs, the future of IRP, three methods to study resource alternatives, the load adjustment method, simultaneous optimization, static analysis, utility profile data, load forecasts and shapes, load data, conversion, variable costs, external analysis, internal analysis, DSM objectives, supply-side prescreening, DSM screening analysis, DSM evaluation, the IRP process, risk analysis, collaborative planning process, and load shape objectives.

21 NUCLEAR POWER REACTORS AND ASSOCIATED PLANTS

23534 (ANL/ED/CP–85916) **Developing safer systems in a NPP environment using the operator's comfort parameters and virtual reality.** Brown-VanHoozer, S.A. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9506202–1: Symposium on human factors management and organization in NPP maintenance outages: impact on safety, Stockholm (Sweden), 19-22 Jun 1995). Order Number DE95014220. Source: OSTI; NTIS; GPO Dep.

The contents of this paper is based on two studies involving the design of visual displays from the operator's point of view, and the utilization of virtual reality for operations, training and maintenance repairs. The studies involve a methodology known as Neuro-Linguistic Programming (NLP), and its use in strengthening design choices from the user's perspective model of the environment. The contents of this paper focuses on the results which may be implemented in nuclear power plants for the purpose of providing systems which are less inherently error prone.

23535 (BNL–95012534) **BNL ALARA Center: ALARA Notes, No. 9.** Khan, T.A. (and others); Xie, J.W.; Beckman, M.C. (eds.). Brookhaven National Lab., Upton, NY (United States). Feb 1994. 62p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. Source: OSTI; NTIS; INIS; GPO.

This issue of the Brookhaven National Laboratory's Alara Notes includes the agenda for the Third International Workshop on ALARA and specific instructions on the use of the on-line fax-on-demand service provided by BNL. Other topics included in this issue are: (1) A discussion of low-level discharges from Canadian nuclear plants, (2) Safety issues at French nuclear plants, (3) Acoustic emission as a means of leak detection, (4) Replacement of steam generators at Doel-3, Beaznau, and North Anna-1, (5) Remote handling equipment at Bruce, (6) EPRI's low level waste program, (7) Radiation protection during concrete repairs at Savannah River, (8) Reactor vessel stud removal/repair at Comanche

Peak-1, (9) Rework of reactor coolant pump motors, (10) Restoration of service water at North Anna-1 and -2, (11) Steam generator tubing problems at Mihama-1, (12) Full system decontamination at Indian Point-2, (13) Chemical decontamination at Browns Ferry-2, and (14) Inspection methodolody in France and Japan.

23536 (KFK–5359) **On the estimation of the steam generator maintenance efficiency by the means of probabilistic fracture mechanics.** Cizelj, L. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Materialforschung; Ljubljana Univ. (Slovenia). Oct 1994. 110p. Order Number DE95791198. Source: OSTI; NTIS (US Sales Only); INIS.

In this report, an original probabilistic model aimed to assess the efficiency of particular maintenance strategy in terms of tube failure probability is proposed. The model concentrates on axial through wall cracks in the residual stress dominated tube expansion transition zone. It is based on the recent developments in probabilistic fracture mechanics and accounts for scatter in material, geometry and crack propagation data. Special attention has been paid to model the uncertainties connected to non-destructive examination technique (e.g., measurement errors, non-detection probability). First and second order reliability methods (FORM and SORM) have been implemented to calculate the failure probabilities. This is the first time that those methods are applied to the reliability analysis of components containing stress-corrosion cracks. In order to predict the time development of the tube failure probabilities, an original linear elastic fracture mechanics based crack propagation model has been developed. It accounts for the residual and operating stresses together. Also, the model accounts for scatter in residual and operational stresses due to the random variations in tube geometry and material data. Due to the lack of reliable crack velocity vs load data, the non-destructive examination records of the crack propagation have been employed to estimate the velocities at the crack tips. (orig./GL)

23537 (NUREG–0750-Vol.41-No.4) **Nuclear Regulatory Commission issuances, April 1995. Volume 41, Number 4.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Freedom of Information and Publications Services. Apr 1995. 83p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

This book contains issuances of the Nuclear Regulatory Commission and of the Atomic Safety and Licensing Boards, and an issuance of the Director's decision. The issuances concern a petition filed by Dr. James E Bauer seeking interlocutory Commission review of the Atomic Safety and Licensing Board's order imposing several restrictions on Dr. Bauer; a denial of an Interveners' Petition for Review addressing the application of Babcock and Wilcox for a renewal of its Special Nuclear Materials License; granting a motion for a protective order, by Sequoyah Fuel Corporation and General Atomics, limiting the use of the protected information to those individuals participating in the litigation and for the purposes of the litigation only; granting a Petitioner's petition for leave to intervene and request for a hearing concerning Georgia Institute of Technology (Georgia Tech Research Reactor) renewal of a facility license; and a denial of a petition filed by Mr. Ted Dougherty requesting a shutdown of the San Onofre Nuclear Generating Station based on concerns regarding the vulnerability of the plant to earthquakes and defensibility of the plant to a terrorist threat.

2101 Power Reactors, Nonbreeding, Light-Water Moderated, Boiling Water Cooled

23538 (CONF-941089–Vol.1, pp. 69-75) **Korea's choice of a new generation of nuclear plants.** Redding, J.R. (GE Nuclear Energy, San Jose, CA (United States)). USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 1.* 459p. Order Number DE95011612. Source: OSTI; NTIS; INIS; GPO Dep.

The ABWR and SBWR design, both under development at GE, provide the best platform for developing the next generation advanced plants. The ABWR, which is rapidly setting the standard for new nuclear reactor plants, is clearly the best choice to meet the present energy needs of Korea. And through a GE/Korea partnership to develop the plant of the next century, Korea will establish itself as a leader in innovative reactor technology.

23539 (CONF-941089–Vol.1, pp. 76-90) **The Advanced BWR Nuclear Plant: Safe, economic nuclear energy.** Redding, J.R. (GE Nuclear Energy, San Jose, CA (United States)). USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 1.* 459p. Order Number DE95011612. Source: OSTI; NTIS; INIS; GPO Dep.

The safety and economics of Advanced BWR Nuclear Power Plants are outlined. The topics discussed include: ABWR Programs: status in US and Japan; ABWR competitiveness: safety and economics; SBWR status; combining ABWR and SBWR: the passive ABWR; and Korean/GE partnership.

23540 (JAERI-Research–95-027) **Synthesis of complex plutonium oxides with alkaline-earth metals.** Suzuki, Yasufumi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Nakajima, Kunihisa; Iwai, Takashi; Ohmichi, Toshihiko; Yamawaki, Michio. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 24p. (In Japanese). Order Number DE95789390. Source: OSTI; NTIS; INIS.

Complex plutonium(IV) oxides with strontium and barium, $SuPuO_3$ and $BaPuO_3$, were synthesized and their crystal structure was analyzed. Compacted mixture of plutonium dioxide powder and the carbonate of strontium or barium was heated in a stream of argon gas using a cell with a small orifice. The products obtained were found to be composed of a nearly single phase showing the structure of orthorhombic slightly distorted from cubic. (author).

23541 (NUREG–1432-Vol.2-Rev.1) **Standard technical specifications combustion engineering plants: Bases (Sections 2.0–3.3). Volume 2, Revision 1.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Project Support. Apr 1995. 347p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

This report documents the results of the combined effort of the NRC and the industry to produce improved Standard Technical Specifications (STS), Revision 1 for General Electric BWR/6 Plants. The changes reflected in Revision 1 resulted from the experience gained from license amendment applications to convert to these improved STS or to adopt partial improvements to existing technical specifications. This NUREG is the result of extensive public technical meetings and discussions between the Nuclear Regulatory Commission (NRC) staff and various nuclear power plant licensees, Nuclear Steam Supply System (NSSS) Owners Groups, NSSS vendors, and the Nuclear Energy Institute (NEI). The improved STS were developed based on the criteria in the Final Commission Policy Statement on Technical Specifications Improvements for Nuclear Power Reactors, dated July 22, 1993. The improved STS will be used as the basis for individual nuclear power plant licensees to develop improved plant-specific technical specifications. This report contains three volumes.

23542 (NUREG–1527) **NRC's object-oriented simulator instructor station.** Griffin, J.I.; Griffin, J.P. Nuclear Regulatory Commission, Washington, DC (United States). Technical Training Div. Jun 1995. 105p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

As part of a comprehensive simulator upgrade program, the simulator computer systems associated with the Nuclear Regulatory Commission's (NRC) nuclear power plant simulators were replaced. Because the original instructor stations for two of the simulators were dependent on the original computer equipment, it was necessary to develop and implement new instructor stations.

This report describes the Macintosh-based Instructor Stations developed by NRC engineers for the General Electric (GE) and Babcock and Wilcox (B and W) simulators.

2102 Power Reactors, Nonbreeding, Light-Water Moderated, Nonboiling Water Cooled

Refer also to citation(s) 23540, 23542, 23586, 23588, 23617, 23618, 23619, 23620, 23621, 23622, 23623, 23624, 23627, 23628, 23629, 23847, 24018, 24959

23543 (ANL/TD/CP–85179) **Nonproliferation and safeguards aspects of fuel cycle programs in reduction of excess separated plutonium and high-enriched uranium.** Persiani, P.J. Argonne National Lab., IL (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9505227–1: 17. ERSADA symposium on safeguards and nuclear material management, Aachen (Germany), 9-11 May 1995). Order Number DE95013406. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this preliminary investigation is to explore alternatives and strategies aimed at the gradual reduction of the excess inventories of separated plutonium and high-enriched uranium (HEU) in the civilian nuclear power industry. The study attempts to establish a technical and economic basis to assist in the formation of alternative approaches consistent with nonproliferation and safeguards concerns. Reference annual mass flows and inventories for a representative 1,400 Mwe Pressurized Water Reactor (PWR) fuel cycle have been investigated for three cases: the 100 percent uranium oxide UO_2 fuel loading once through cycle, and the 33 percent mixed oxide MOX loading configuration for a first and second plutonium recycle. The analysis addresses fuel cycle developments; plutonium and uranium inventory and flow balances; nuclear fuel processing operations; UO_2 once-through and MOX first and second recycles; and the economic incentives to drawdown the excess separated plutonium stores. The preliminary analysis explores several options in reducing the excess separated plutonium arisings and HEU, and the consequences of the interacting synergistic effects between fuel cycle processes and isotopic signatures of nuclear materials on nonproliferation and safeguards policy assessments.

23544 (CONF-941089–Vol.1, pp. 41-58) **Nuclear power program and technology development in Korea.** Cho, Byung-Oke. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 1.* 459p. Order Number DE95011612. Source: OSTI; NTIS; INIS; GPO Dep.

KEPCO has successfully implemented the construction and operation of nuclear power plants since the early 1970s, and will continue to build safer and more efficient nuclear plants in the future in accordance with the nuclear power development plan previously established. KEPCO will also make every effort to enhance nuclear safety and obtain the public's acceptance for nuclear power. We are, however, facing the same difficulties, as United States and other countries have, in strengthened regulatory requirements, public acceptance, radwaste disposal, and acquisition of new plant sites despite an active nuclear power program. Story of Ted Turner, CNN; "It ain't as easy as it looks." Yes! It is difficult. But we will cope with these issues so that we can promote the nuclear power development and continue to supply a highly economical and clean energy to the world. In this regard, it is my sincere wish that each organization participating in the nuclear industry, especially Korea and United States strengthen their ties and help each other so that we together can successfully accomplish our goals.

23545 (CONF-941089–Vol.1, pp. 59-68) **Light water reactor program.** Franks, S.M. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 1.* 459p. Order Number DE95011612. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy's Light Water Reactor Program is outlined. The scope of the program consists of: design certification of evolutionary plants; design, development, and design certification of simplified passive plants; first-of-a-kind engineering to achieve commercial standardization; plant lifetime improvement; and advanced reactor severe accident program. These program activities of the Office of Nuclear Energy are discussed.

23546 (CONF-941089–Vol.1, pp. 91-93) **ABB Combustion Engineering nuclear technology.** Matzie, R.A. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 1.* 459p. Order Number DE95011612. Source: OSTI; NTIS; INIS; GPO Dep.

The activities of ABB Combustion Engineering in the design and construction of nuclear systems and components are briefly reviewed. ABB Construction Engineering continues to improve the design and design process for nuclear generating stations. Potential improvements are evaluated to meet new requirements both of the public and the regulator, so that the designs meet the highest standards worldwide. Advancements necessary to meet market needs and to ensure the highest level of performance in the future will be made.

23547 (CONF-941089–Vol.1, pp. 94-114) **ABB Combustion Engineering's nuclear experience and technologies.** Matzie, R.A. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 1.* 459p. Order Number DE95011612. Source: OSTI; NTIS; INIS; GPO Dep.

ABB Combustion Engineering's nuclear experience and technologies are outlined. The following topics are discussed: evolutionary approach using proven technology, substantial improvement to plant safety, utility perspective up front in developing design, integrated design, competitive plant cost, operability and maintainability, standardization, and completion of US NRC technical review.

23548 (NUREG–1430-Vol.1-Rev.1) **Standard technical specifications: Babcock and Wilcox Plants. Revision 1.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Project Support. Apr 1995. 322p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

This report documents the results of the combined effort of the NRC and the industry to produce improved Standard Technical Specifications (STS), Revision 1 for Babcock & Wilcox Plants. The changes reflected in Revision 1 resulted from the experience gained from license amendment applications to convert to these improved STS or to adopt partial improvements to existing technical specifications. This NUREG is the result of extensive public technical meetings and discussions between the Nuclear Regulatory Commission (NRC) staff and various nuclear power plant licensees, Nuclear Steam Supply System (NSSS) Owners Groups, NSSS vendors, and the Nuclear Energy Institute (NEI). The improved STS were developed based on the criteria in the Final Commission Policy Statement on Technical Specifications Improvements for Nuclear Power Reactors, dated July 22, 1993. The improved STS will be used as the basis for individual nuclear power plant licensees to develop improved plant-specific technical specifications. This report contains three volumes. Volume 1 contains the Specifications for all chapters and sections of the improved STS. Volume 2 contains the Bases for Chapters 2.0 and 3.0, and Sections 3.1–3.3 of the improved STS. Volume 3 contains the Bases for Sections 3.4–3.9 of the improved STS.

23549 (NUREG–1431-Vol.1-Rev.1) **Standard technical specifications, Westinghouse Plants: Specifications. Volume 1, Revision 1.** Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Reactor Regulation. Apr 1995. 405p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

This NUREG contains the improved Standard Technical Specifications (STS) for Westinghouse plants. Revision 1 incorporates the cumulative changes to Revision 0, which was published in September 1992. The changes reflected in Revision 1 resulted from the experience gained from license amendment applications to convert to these improved STS or to adopt partial improvements to existing technical specifications. This NUREG is the result of extensive public technical meetings and discussions between the Nuclear Regulatory Commission (NRC) staff and various nuclear power plant licensees, Nuclear Steam Supply System (NSSS) Owners Groups, specifically the Westinghouse Owners Group (WOG), NSSS vendors, and the Nuclear Energy Institute (NEI). The improved STS were developed based on the criteria in the Final Commission Policy Statement on Technical Specifications Improvements for Nuclear Power Reactors, dated July 22, 1993 (58 FR 39132). Licensees are encouraged to upgrade their technical specifications consistent with those criteria and conforming, to the extent practical and consistent with the licensing basis for the facility, to Revision 1 to the improved STS. The Commission continues to place the highest priority on requests for complete conversions to the improved STS. Licensees adopting portions of the improved STS to existing technical specifications should adopt all related requirements, as applicable, to achieve a high degree of standardization and consistency.

23550 (NUREG–1431-Vol.2-Rev.1) **Standard technical specifications, Westinghouse Plants: Bases (Sections 2.0–3.3). Volume 3, Revision 1.** Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Reactor Regulation. Apr 1995. 548p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

This NUREG contains the improved Standard Technical Specifications (STS) for Westinghouse plants. Revision 1 incorporates the cumulative changes to Revision 0, which was published in September 1992. The changes reflected in Revision 1 resulted from the experience gained from license amendment applications to convert to these improved STS or to adopt partial improvements to existing technical specifications. This NUREG is the result of extensive public technical meetings and discussions between the Nuclear Regulatory Commission (NRC) staff and various nuclear power plant licensees, Nuclear Steam Supply System (NSSS) Owners Groups, specifically the Westinghouse Owners Group (WOG), NSSS vendors, and the Nuclear Energy Institute (NEI). The improved STS were developed based on the criteria in the Final Commission Policy Statement on Technical Specifications Improvements for Nuclear Power Reactors, dated July 22, 1993 (58 FR 39132). Licensees are encouraged to upgrade their technical specifications consistent with those criteria and conforming, to the extent practical and consistent with the licensing basis for the facility, to Revision 1 to the improved STS. The Commission continues to place the highest priority on requests for complete conversions to the improved STS. Licensees adopting portions of the improved STS to existing technical specifications should adopt all related requirements, as applicable, to achieve a high degree of standardization and consistency.

23552 (JAERI-Review–95-004) **Review of experimental studies of zirconium carbide coated fuel particles for high temperature gas-cooled reactors.** Minato, Kazuo (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Ogawa, Toru; Fukuda, Kousaku. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 31p. Order Number DE95789252. Source: OSTI; NTIS; INIS.

Experimental studies of zirconium carbide(ZrC) coated fuel particles were reviewed from the viewpoints of fuel particle designs, fabrication, characterization, fuel performance, and fission product retentiveness. ZrC is known as a refractory and chemically stable compound, so ZrC is a candidate to replace the silicon carbide(SiC) coating layer of the Triso-coated fuel particles. The irradiation experiments, the postirradiation heating tests, and the out-of-reactor experiments showed that the ZrC layer was less susceptible than the SiC layer to chemical attack by fission products and fuel kernels, and that the ZrC-coated fuel particles performed better than the standard Triso-coated fuel particles at high temperatures, especially above 1600degC. The ZrC-coated fuel particles demonstrated better cesium retention than the standard Triso-coated fuel particles though the ZrC layer showed a less effective barrier to ruthenium than the SiC layer. 23553 (WAPD-TM–1633) **Preirradiation Data summary for the GRIT-II HTGR irradiation test specimens.** Hollenbeck, J.L. Bettis Atomic Power Lab., West Mifflin, PA (United States). May 1995. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC11-93PN38195. Order Number DE95013277. Source: OSTI; NTIS; INIS; GPO Dep.

This document comprises a report of preirradiation data on the NPR-5 and NPR-8 fuel types tested in the GRIT-II HTGR Irradiation Test in the Advanced Test Reactor. A summary of fuel characterization, GRIT-II test fabrication data, outlines of fabrication procedures, and a discussion of the GRIT technique for individual fuel bead testing is presented. Objective of the test is to provide individual irradiated HTGR fuel beads for post-irradiation valuation with total target burnups of 25, 50, and 75% fissions of initial metal atoms (FIMA).

23554 (ANL/FE/CP–85555) **Failed fuel identification techniques for liquid-metal cooled reactors.** Lambert, J.D.B. (Argonne National Lab., IL (United States)); Gross, K.C.; Mikaili, R.; Frank, S.M.; Cutforth, D.C.; Angelo, P.L. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950311–7: International conference on fuel management and handling, Edinburgh (United Kingdom), 20-22 Mar 1995). Order Number DE95012278. Source: OSTI; NTIS; INIS; GPO Dep.

The Experimental Breeder Reactor II (EBR-II), located in Idaho and operated for the US Department of Energy by Argonne National Laboratory, has been used as an irradiation testbed for LMR fuels and components for thirty years. During this time many endurance tests have been carried out with experimental LMR metal, oxide, carbide and nitride fuel elements, in which cladding failures were intentionally allowed to occur. This paper describes methods that have been developed for the detection, identification and verification of fuel failures.

23555 (ANL/IFR/CP–82835) **Computer imaging of EBR-II fuel handling equipment.** Peters, G.G.; Hansen, L.H. Argonne National Lab., Idaho Falls, ID (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950311–5: International conference on fuel management and handling, Edinburgh (United Kingdom), 20-22 Mar 1995). Order Number DE95012932. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes a three-dimensional graphics application used to visualize the positions of remotely operated fuel handling equipment in the EBR-II reactor. A three-dimensional (3D) visualization technique is necessary to simulate direct visual observation of the transfers of fuel and experiments into and out of the reactor because the fuel handling equipment is submerged in liquid sodium and therefore is not visible to the operator. The system described in this paper uses actual signals to drive a three-dimensional computer-generated model in real-time in response to movements of equipment in the plant This paper will present details on how the 3D model of the intank equipment was created and how real-time dynamic behavior was added to each of the moving components.

Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950311–6: International conference on fuel management and handling, Edinburgh (United Kingdom), 20-22 Mar 1995). Order Number DE95012931. Source: OSTI; NTIS; INIS; GPO Dep.

The material presented in this paper is based on two studies involving visual display designs and the user's perspective model of a system. The studies involved a methodology known as Neuro-Linguistic Programming (NLP), and its use in expanding design choices which included the "comfort parameters" and "perspective reality" of the user's model of the world. In developing visual displays for the EBR-II fuel handling system, the focus would be to incorporate the comfort parameters that overlap from each of the representation systems: visual, auditory and kinesthetic then incorporate the comfort parameters of the most prominent group of the population, and last, blend in the other two representational system comfort parameters. The focus of this informal study was to use the techniques of meta-modeling and synesthesia to develop a virtual environment that closely resembled the operator's perspective of the fuel handling system of Argonne's Experimental Breeder Reactor - II. An informal study was conducted using NLP as the behavioral model in a v reality (VR) setting.

This issue is the collection of the papers presented on heat transfer and fluid flow of FBR type reactors. The 4 of the presented papers are indexed individually. (J.P.N.).

2106 Power Reactors, Mobile, Propulsion, Package, and Transportable

23558 (DOE/SF/18852–T53) **Monthly technical progress report, May 29, 1995–July 2, 1995.** Waks, J.M. Martin Marietta Astro Space, King of Prussia, PA (United States). 24 Jul 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-91SF18852. Order Number DE95015363. Source: OSTI; NTIS; INIS; GPO Dep.

The technical progress achieved during the period 29 May through 2 July 1995 on Contract DE-AC03-91SF18852 Radioisotope Thermoelectric Generators and Ancillary Activities is described herein.

23559 (LA-UR–95-1383) **Heatpipe space power and propulsion systems.** Houts, M.G.; Poston, D.I.; Ranken, W.A. Los Alamos National Lab., NM (United States). [1995]. 8p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950729–10: 30. Intersociety energy conversion conference, Orlando, FL (United States), 30 Jul - 5 aug 1995). Order Number DE95014013. Source: OSTI; NTIS; GPO Dep.

Safe, reliable, low-mass space power and propulsion systems could have numerous civilian and military applications. This paper discusses two fission-powered concepts: the Heatpipe Power System (HPS) that provides power only, and the Heatpipe Bimodal System (HBS) that provides both power and thermal propulsion. Both concepts have 10 important features. First, only existing technology and recently tested fuel forms are used. Second, fuel can be removed whenever desired, greatly facilitating system fabrication and handling. Third, full electrically heated system testing is possible, with minimal operations required to replace the heaters with fuel and ready the system for launch. Fourth, the systems are passively subcritical during launch accidents. Fifth, a modular approach is used, and most technical issues can be resolved with inexpensive module tests. Sixth, bonds between dissimilar metals are minimized. Seventh, there are no single point failures during power mode operation. Eighth, fuel burnup rate is quite low to help ensure greater than 10-year system life. Ninth, there are no pumped coolant loops, and the systems can be shut down and restarted without coolant freeze/thaw concerns. Finally, a full ground nuclear test is not needed, and development costs will be low. The baseline HPS uses SNAP-10A-style thermoelectric power converters to produce 5 kWe at a system mass of about 500 kg. The unicouple thermoelectric converters have a hot shoe temperature of 1275 K and reject waste heat at 775 K. This type of thermoelectric converter has been used extensively by the space program, demonstrating an operational lifetime of decades. At higher thermal power, the same core can produce over 10 kWe using thermoelectric converters, and over 50 kWe using advanced power conversion systems.

23560 (NUREG–0750-Vol.41-Index-1) **Indexes to Nuclear Regulatory Commission issuances, January–March 1995. Volume 41, Index 1.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Freedom of Information and Publications Services. Jun 1995. 34p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

Digests and indexes for issuances of the Commission (CLI), the Atomic Safety and Licensing Board Panel (LBP), the Administrative Law Judges (ALJ), the Directors' Decisions (DD), and the Denials of Petitions for Rulemaking (DPRM) are presented in this document. These digests and indexes are intended to serve as a guide to the issuances. Information elements common to the cases heard and ruled upon are: case name (owner(s) of facility); full text reference (volume and pagination); issuance number; issues raised by appellants; legal citations (cases, regulations, and statutes); name of facility, docket number; subject matter of issues and/or rulings; type of hearing (for construction permit, operating license, etc.); and type of issuance (memorandum, order, decision, etc.).

23561 (NUREG–0750-Vol.41-No.3) **Nuclear Regulatory Commission issuances, March 1995. Volume 41, No. 3.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Freedom of Information and Publications Services. 1995. 70p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

This report includes the issuances received during the specified period from the Commission (CLI), the Atomic Safety and Licensing Boards (LBP), the Administrative Law Judges (ALJ), the Directors' Decisions (DD), and the Decisions on Petitions for Rulemaking (DPRM).

23562 (NUREG–0940-Vol.14-No.1-Pt.1) **Enforcement actions: Significant actions resolved. Reactor licensees: Volume 14, No. 1, Part 1, Quarterly progress report January–March 1995.** Nuclear Regulatory Commission, Washington, DC (United States). Office of Enforcement. [1995]. 352p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

This compilation summarizes significant enforcement actions that have been resolved during one quarterly period (January–March 1995) and includes copies of letters, Notices, and Orders sent by the Nuclear Regulatory Commission to reactor licensees with respect to these enforcement actions. It is anticipated that the information in this publication will be widely disseminated to managers and employees engaged in activities licensed by the NRC, so that actions can be taken to improve safety by avoiding future violations similar to those described in this publication.

23563 (NUREG–1478-Rev.1) **Non-Power Reactor Operator Licensing Examiner Standards. Revision 1.** Nuclear Regulatory Commission, Washington, DC (United States). Div. of Reactor Controls and Human Factors. Jun 1995. 170p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

The Non-Power Reactor Operator Licensing Examiner Standards provide policy and guidance to NRC examiners and establish the procedures and practices for examining and licensing of applicants for NRC operator licenses pursuant to Part 55 of Title 10 of the Code of Federal Regulations (10 CFR 55). They are intended to assist NRC examiners and facility licensees to understand the examination process better and to provide for equitable and consistent administration of examinations to all applicants by NRC examiners. These standards are not a substitute for the operator licensing regulations and are subject to revision or other internal operator examination licensing policy changes. As appropriate, these standards will be revised periodically to accommodate comments and reflect new information or experience.

23565 (ANL/ET/CP–84157) **Pressure transient in liquid lines.** Sun, J.G. (Argonne National Lab., IL (United States)); Wang, X.Q. Argonne National Lab., IL (United States). [1995]. 14p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950740–65: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Source: OSTI; NTIS; INIS.

The pressure surge that results from a step change of flow in liquid pipelines, commonly known as water hammer, was analyzed by an eigenfunction method. A differential-integral Pressure wave equation and a linearized velocity equation were derived from the equations of mass and momentum conservation. Waveform distortion due to viscous dissipation and pipe-wall elastic expansion is characterized by a dimensionless transmission number K. The pressure surge condition, which is mathematically singular, was used in the solution procedure. The exact solutions from numerical calculation of the differential-integral equation provide a complete Pressure transient in the pipe. The problems are also calculated With the general-purpose computer code COMMIX, which solves the exact mass conservation equation and Navier-Stokes equations. These solutions were compared with published experimental results, and agreement was good. The effect of turbulence on the pressure transient is discussed in the light of COMMIX calculational results.

23566 (ANL/RE/CP–85732) **PRODIAG – Dynamic qualitative analysis for process fault diagnosis.** Reifman, J.; Wei, T.Y.C. Argonne National Lab., IL (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950564–5: 9. symposium on power plant dynamics, control and testing, Knoxville, TN (United States), 24-26 May 1995). Order Number DE95013403. Source: OSTI; NTIS; INIS; GPO Dep.

The authors present a method for handling the dynamic effects of process component malfunctions through time-independent rule-based diagnostic systems. The method's theory is discussed and a simplified version is implemented in the process diagnostic expert system PRODIAG. Simulation results from a full-scope operator training simulator of a nuclear power plant are used to illustrate the method.

23567 (BNL-NUREG–61789) **Plant maintenance and aging management: Are they the same?.** Lofaro, R.J. Brookhaven National Lab., Upton, NY (United States). [1995]. 10p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950740–51: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Source: OSTI; NTIS; INIS.

As part of the NRC's Nuclear Plant Aging Research Program, a number of aging studies were performed on safety-related systems and components which found that, even with current maintenance and monitoring practices in place, a large number of the reported failures are related to aging. This suggests that current practices are not sufficient to completely manage aging degradation, and other factors need to be considered. This paper examines the aging management process and the degree to which maintenance plays a part in it. Component failures and degradation mechanisms identified in aging studies of several different safety systems are summarized and evaluated, then con-elated with the components most frequently failed. This information, along with an analysis of failure causes, is then used to determine the extent to which aging is managed by current maintenance practices. Conclusions and recommendations for proper aging management arc also presented.

23568 (CONF-941089–Vol.1, pp. 115-137) **Optimization of life cycle management costs.** Banerjee, A.K. (Stone & Webster Engineering Corp., Boston, MA (United States)). USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 1*. 459p. Order Number DE95011612. Source: OSTI; NTIS; INIS; GPO Dep.

As can be seen from the case studies, a LCM program needs to address and integrate, in the decision process, technical, political, licensing, remaining plant life, component replacement cycles, and financial issues. As part of the LCM evaluations, existing plant

programs, ongoing replacement projects, short and long-term operation and maintenance issues, and life extension strategies must be considered. The development of the LCM evaluations and the cost benefit analysis identifies critical technical and life cycle cost parameters. These "discoveries" result from the detailed and effective use of a consistent, quantifiable, and well documented methodology. The systematic development and implementation of a plant-wide LCM program provides for an integrated and structured process that leads to the most practical and effective recommendations. Through the implementation of these recommendations and cost effective decisions, the overall power production costs can be controlled and ultimately lowered.

23569 (CONF-941089–Vol.1, pp. 139-204) **Advanced maintenance, inspection & repair technology for nuclear power plants.** Hinton, B.M. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 1.* 459p. Order Number DE95011612. Source: OSTI; NTIS; INIS; GPO Dep.

Maintenance, inspection, and repair technology for nuclear power plants is outlined. The following topics are discussed: technology for reactor systems, reactor refueling bridge, fuel inspection system, fuel shuffling software, fuel reconstitution, CEA/RCCA/CRA inspection, vessel inspection capabilities, CRDM inspection and repair, reactor internals inspection and repair, stud tensioning system, stud/nut cleaning system, EDM machining technology, MI Cable systems, core exit T/C nozzle assemblies, technology for steam generators, genesis manipulator systems, ECT, UT penetrant inspections, steam generator repair and cleaning systems, technology for balance of plant, heat exchangers, piping and weld inspections, and turbogenerators.

23570 (CONF-941089–Vol.1, pp. 205-225) **Improved technical specifications.** Hoffman, D.R. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 1.* 459p. Order Number DE95011612. Source: OSTI; NTIS; INIS; GPO Dep.

Improved technical specifications for nuclear power plants are outlined. The objectives of this work are to improve safety, provide a clearer understanding of safety significance, and ease NRC and industry administrative burdens. Line item improvements, bases, and implementation of the specifications are discussed.

23571 (CONF-941089–Vol.1, pp. 227-240) **ENIDINE: Vibration and seismic isolation technologies for power generation station applications.** Zemanek, T.A. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 1.* 459p. Order Number DE95011612. Source: OSTI; NTIS; INIS; GPO Dep.

ENIDINE Inc. is a world leader in the design and manufacture of shock and vibration mounts. Founded in 1966, the company has two manufacturing facilities, employs over 300 people and supports a worldwide network of distributors and representatives. ENIDINE Inc. is part of the ENIDINE Corporate Group which owns a number of companies that design and manufacture Hydraulic/Pneumatic cylinders, Electromechanical devices, Hydraulic Control Valves and a number of Industrial Distribution companies throughout Europe. In total, the ENIDINE Corporate Group has over 900 employees with annual sales of over $100 million. ENIDINE shock and vibration mounts are used to isolate the vibration of missiles from their guidance systems, pumps from hospital operating equipment and off shore oil rigs, from the shock energy of waves in the North Sea. ENIDINE products can be found on all Boeing and McDonnell Douglas aircraft, as well as many electronic and weapons systems on board Navy ships.

23572 (CONF-941089–Vol.1, pp. 241-254) **A versatile electrical penetration design qualified to IEEE Std. 317-1983.** Lankenau, W. (Imaging & Sensing Technology Corp., Horseheads, NY (United States)); Wetherill, T.M. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 1.* 459p. Order Number DE95011612. Source: OSTI; NTIS; INIS; GPO Dep.

Although worldwide demand for new construction of nuclear power stations has been on a decline, the available opportunities for the design and construction of qualified electrical penetrations continues to offer challenges, requiring a highly versatile design. Versatility is necessary in order to meet unique customer requirements within the constraints of a design basis qualified to IEEE Std. 317-1983. This paper summarizes such a versatile electrical penetration designed, built and tested to IEEE Std. 317-1983. The principal features are described including major materials of construction. Some of the design constraints such as sealing requirements, and conductor density (including numerical example) are discussed. The requirements for qualification testing of the penetration assembly to IEEE Std. 317-1983 are delineated in a general sense, and some typical test ranges for preconditioning, radiation exposure, and LOCA are provided. The paper concludes by describing ways in which this versatile design has been adapted to meet unique customer requirements in a variety of nuclear power plants.

23573 (CONF-941089–Vol.1, pp. 255-264) **Testing and plugging power plant heat exchangers.** Sutor, F. (Expando Seal Tools, Inc., Montgomeryville, PA (United States)). USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 1.* 459p. Order Number DE95011612. Source: OSTI; NTIS; INIS; GPO Dep.

Heat Exchanger tubes fail for any number of reasons including but certainly not limited to the cumulative effects of corrosion, erosion, thermal stress and fatigue. This presentation will attempt to identify the most common techniques for determining which tubes are leaking and then introduce the products in use to plug the leaking tubes. For the sake of time I will limit the scope of this presentation to include feedwater heaters and secondary system heat exchangers such as Hydrogen Coolers, Lube Oil Coolers, and nuclear Component Cooling Water, Emergency Cooling Water, Regenerative Heat Recovery heat exchangers.

23574 (CONF-9507130–1) **Stress-intensity-factor influence coefficients for semielliptical inner-surface flaws in clad pressure vessels.** Keeney, J.A.; Bryson, J.W. Oak Ridge National Lab., TN (United States). [1995]. 15p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. Interagency Agreement 1886-8011-9B. From 26. national symposium on fracture mechanics; Idaho Falls, ID (United States); 27 Jul 1995. Order Number DE95013207. Source: OSTI; NTIS; INIS; GPO Dep.

A problem of particular interest in pressure vessel technology is the calculation of accurate stress-intensity factors for semielliptical surface cracks in cylinders. Computing costs for direct solution techniques can be prohibitive when applied to three-dimensional (3-D) geometries with time-varying boundary conditions such as those associated with pressurized thermal shock. An alternative superposition technique requires the calculation of a set of influence coefficients for a given 3-D crack model that can be superimposed to obtain mode-I stress-intensity factors. This paper presents stress-intensity-factor influence coefficients (SIFICs) for axially and circumferentially oriented finite-length semielliptical inner-surface flaws with aspect ratios [total crack length (2c) to crack depth (a)] of 2, 6, and 10 for clad cylinders having an internal radius (R_i) to wall thickness (t) ratio of 10. SEFICs are computed for flaw depths in the range of $0.01 \leq a/t \leq 0.5$ and two cladding thicknesses. The incorporation of this SEFIC data base in fracture mechanics codes will facilitate the generation of fracture mechanics solutions for a wide range of flaw geometries as may be required in structural

integrity assessments of pressurized-water and boiling-water reactors.

23575 (NUREG/CR–4639-Vol.5-Rev.4) **Nuclear Computerized Library for Assessing Reactor Reliability (NUCLARR): Data manual, Part 2: Human Error Probability (HEP) Data. Volume 5, Revision 4.** Reece, W.J. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Gilbert, B.G.; Richards, R.E. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Research; EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1994. 449p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-76ID01570. (EGG–2458-Vol.5-Rev.4). Source: OSTI; NTIS; GPO; INIS.

This data manual contains a hard copy of the information in the Nuclear Computerized Library for Assessing Reactor Reliability (NUCLARR) Version 3.5 database, which is sponsored by the US Nuclear Regulatory Commission. NUCLARR was designed as a tool for risk analysis. Many of the nuclear reactors in the US and several outside the US are represented in the NUCLARR database. NUCLARR includes both human error probability estimates for workers at the plants and hardware failure data for nuclear reactor equipment. Aggregations of these data yield valuable reliability estimates for probabilistic risk assessments and human reliability analyses. The data manual is organized to permit manual searches of the information if the computerized version is not available. Originally, the manual was published in three parts. In this revision the introductory material located in the original Part 1 has been incorporated into the text of Parts 2 and 3. The user can now find introductory material either in the original Part 1, or in Parts 2 and 3 as revised. Part 2 contains the human error probability data, and Part 3, the hardware component reliability data.

23576 **Vortex diode jet.** Houck, E.D. To Dept. of Energy. 1993. Filed date 27 May 1993. U.S. Patent Application 8-067,914. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-84ID12435. Order Number DE95015042. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A fluid transfer system that combines a vortex diode with a jet ejector to transfer liquid from one tank to a second tank by a gas pressurization method having no moving mechanical parts in the fluid system. The vortex diode is a device that has a high resistance to flow in one direction and a low resistance to flow in the other.

23577 (ANL/RA/CP–82800) **Automatic inspection for remotely manufactured fuel elements.** Reifman, J. (Argonne National Lab., IL (United States)); Vitela, J.E.; Gibbs, K.S.; Benedict, R.W. Argonne National Lab., IL (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950232–34: 6. American Nuclear Society meeting on robotics and remote systems, Monterey, CA (United States), 5-10 Feb 1995). Order Number DE95012289. Source: OSTI; NTIS; INIS; GPO Dep.

Two classification techniques, standard control charts and artificial neural networks, are studied as a means for automating the visual inspection of the welding of end plugs onto the top of remotely manufactured reprocessed nuclear fuel element jackets. Classificatory data are obtained through measurements performed on pre- and post-weld images captured with a remote camera and processed by an off-the-shelf vision system. The two classification methods are applied in the classification of 167 dummy stainless steel (HT9) fuel jackets yielding comparable results.

23578 (FZKA–5582) **Measurements of turbulent velocity and temperature in a wall channel of a heated rod bundle.** Krauss, T.; Meyer, L. Forschungszentrum Karlsruhe GmbH Technik und Umwelt (Germany). Inst. fuer Neutronenphysik und Reaktortechnik. May 1995. 110p. Order Number DE95790240. Source: OSTI; NTIS (US Sales Only); INIS.

Turbulent air flow in a wall sub-channel of a heated 37-rod bundle (P/D=1.12, W/D=1.06) was investigated. Measurements were performed with a hot-wire probe with x-wires and a temperature wire. The mean velocity, the mean fluid temperature, the wall shear stress and wall temperature, the turbulent quantities such as the turbulent kinetic energy, the Reynolds-stresses and the turbulent heat fluxes were measured and are discussed with respect to data from isothermal flow in a wall channel and heated flow in a central channel of the same rod bundle. Also, data on the power spectral densities of the velocity and temperature fluctuations are presented. These data show the existence of large scale periodic fluctuations of velocity and temperature in the gap region of two adjacent rods or between rods and the wall. These fluctuations are responsible for the high intersubchannel heat and momentum exchange. (orig.)

23579 (JAERI-Research–95-008) **Post irradiation examinations of uranium-plutonium mixed nitride fuel irradiated in JMTR (88F-5A capsule).** Arai, Yasuo (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Iwai, Takashi; Sasayama, Tatsuo; Okamoto, Yoshihiro; Nakajima, Kunihisa; Sukegawa, Tomohide; Yamahara, Takeshi; Suzuki, Yasufumi; Niimi, Motoji. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1995. 100p. (In Japanese). Order Number DE95789260. Source: OSTI; NTIS; INIS.

Two helium-bonded fuel pins filled with uranium-plutonium mixed nitride pellets were encapsulated in 88F-5A and irradiated in JMTR up to 4.1%FIMA at a maximum linear power of 65 kW/m. The capsule cooled for ≈4 months was transported to Reactor Fuel Examination Facility and subjected to non-destructive and destructive post irradiation examinations. Any failure was not observed in the irradiated fuel pins. It was found from the temperature change at pellet center that the helium gap between the pellets and the cladding tube was gradually closed during irradiation. Very low fission gas release rate of about 2-3% was observed, while the diametric increase of fuel pin was limited to ≈0.4% at the position of maximum reading. The inner surface of cladding tube did not show the signs of chemical interaction with fuel. In addition, some information on restructuring of fuel pellets was obtained. (author).

Source: OSTI; NTIS; INIS; GPO Dep.

A robust μ-synthesis controller for the EBR-II reactor primary system and the DSNP simulations verifying the excellent robustness of the controller over a wide range of power are presented.

23581 (ANL/IFR/CP–83964) **EBR-II secondary sodium loop Plugging Temperature Indicator control system upgrade.** Carlson, R.B.; Gehrman, R.L. Argonne National Lab., Idaho Falls, ID (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950564–2: 9. symposium on power plant dynamics, control and testing, Knoxville, TN (United States), 24-26 May 1995). Order Number DE95013471. Source: OSTI; NTIS; INIS; GPO Dep.

The Experimental Breeder Reactor II (EBR-II) secondary sodium coolant loop Plugging Temperature Indicator (PTI) control system was upgraded in 1993 to a real-time computer based system. This was done to improve control, to remove obsolete and high maintenance equipment, and to provide a graphical CRT based operator interface. A goal was to accomplish this inexpensively using small, reliable computer and display hardware with a minimum of purchased software. This paper describes the PTI system, the upgraded control system and its operator interface, and development methods and tools. The paper then assesses how well the system met its goals, discusses lessons learned and operational improvements noted, and provides some recommendations and suggestions on applying small real-time control systems of this type.

23582 (ANL/IFR/SUMM–85396) **Simplified modeling of the EBR-II control rods.** Angelo, P.L. Argonne National Lab., Idaho Falls, ID (United States). 25 Jun 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950601–14: Annual meeting of the American Nuclear Society (ANS), Philadelphia, PA (United States), 25-29 Jun 1995). Order Number DE95014234. Source: OSTI; NTIS; INIS; GPO Dep.

Simplified models of EBR-II control and safety rods have been developed for core modeling under various operational and shutdown conditions. A parametric study was performed on normal worth, high worth, and safety rod type control rods. A summary of worth changes due to individual modeling approximations is tabulated. Worth effects due to structural modeling simplification are negligible. Fuel region homogenization and burnup compression contributes more than any other factor. Reference case C/E values (ratio of calculated worth from detailed model to measured worth) of 1.072 and 1.142 for safety and normal worth rods indicate acceptable errors when the approximations are used. Fuel burnup effect illustrates rod worth sensitivity to the modeling approximation. Aggregate effects are calculated under a reduced mesh.

23583 (BNL-NUREG–61712) **Methodological issues in the validation of complex human-machine systems.** O'Hara, J. (Brookhaven National Lab., Upton, NY (United States)); Stubler, W.; Wachtel, J. Brookhaven National Lab., Upton, NY (United States). [1995]. 6p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9506175–3: Computer-based human support systems: technology, methods and future, Philadelphia, PA (United States), 25-29 Jun 1995). Order Number DE95011778. Source: OSTI; NTIS; GPO Dep.

Integrated system validation is one aspect of the US Nuclear Regulatory Commission's design review process for human-system interfaces. This paper will consider three methodological issues that must be addressed in validation and their implications for drawing conclusions about the acceptability of the integrated system. They are: representing the integrated system, representing the operational events it must handle, and representing system performance. A logical basis for generalizability from validation tests to predicted performance of the integrated system emerges from the comparability of the psychological and physical processes of the test and actual situations. Generalizability of results is supported when the integrated system, operating conditions and performance are representative of their real-world counterparts. The methodological considerations for establishing representativeness are discussed.

23584 (BNL-NUREG–61715) **Advanced alarm systems: Display and processing issues.** O'Hara, J.M. (Brookhaven National Lab., Upton, NY (United States)); Wachtel, J.; Perensky, J. Brookhaven National Lab., Upton, NY (United States). [1995]. 8p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. This paper describes a research program sponsored by the US Nuclear Regulatory Commission to address the human factors engineering (HFE) deficiencies associated with nuclear power plant alarm systems. The overall objective of the study is to develop HFE review guidance for alarm systems. In support of this objective, human performance issues needing additional research were identified. Among the important issues were alarm processing strategies and alarm display techniques. This paper will discuss these issues and briefly describe our current research plan to address them.

23585 (Juel–2928) **Development of advanced methods and related software for human reliability evaluation within probabilistic safety analyses.** Kosmowski, K.T. (Gdansk Univ. (Poland)); Mertens, J.; Degen, G.; Reer, B. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Sicherheitsforschung und Reaktortechnik. Jun 1994. 184p. Order Number DE95791275. Source: OSTI; NTIS (US Sales Only); INIS.

Human Reliability Analysis (HRA) is an important part of Probabilistic Safety Analysis (PSA). The first part of this report consists of an overview of types of human behaviour and human error including the effect of significant performance shaping factors on human reliability. Particularly with regard to safety assessments for nuclear power plants a lot of HRA methods have been developed. The most important of these methods are presented and discussed in the report, together with techniques for incorporating HRA into PSA and with models of operator cognitive behaviour. Based on existing HRA methods the concept of a software system is described. For the development of this system the utilization of modern programming tools is proposed; the essential goal is the effective application of HRA methods. A possible integration of computeraided HRA within PSA is discussed. The features of Expert System Technology and examples of applications (PSA, HRA) are presented in four appendices. (orig.)

This paper presents results of a parametric study performed to investigate the effect of pore water in saturated soils on the response of nuclear containment structures to seismic motions. The technique employed uses frequency domain algorithm which incorporates impedances for both dry and saturated soils into an SSI model. A frequency domain time history analysis is carried out using the computer code CARES for a typical PWR containment structure. Structural responses presented in terms of floor response spectra indicate that considering the presence of the pore water in soils could benefit the design of massive nuclear containment structures.

23587 (NUREG/CP–0141) **Proceedings of the 23rd DOE/NRC nuclear air cleaning conference.** First, M.W. (ed.) (Harvard Univ., Boston, MA (United States). Harvard Air Cleaning Lab.). (CONF-940738–: 23. DOE/NRC nuclear air cleaning and treatment conference, Buffalo, NY (United States), 25-28 Jul 1994). Source: OSTI; NTIS; GPO; INIS.

The report contains the papers presented at the 23rd DOE/NRC Nuclear Air Cleaning Conference and the associated discussions. Major topics are: (1) nuclear air cleaning codes, (2) nuclear waste, (3) filters and filtration, (4) effluent stack monitoring, (5) gas processing, (6) adsorption, (7) air treatment systems, (8) source terms and accident analysis, and (9) fuel reprocessing.

23588 (NUREG/CR–6144-Vol.6-Pt.1) **Evaluation of potential severe accidents during low power and shutdown operations at Surry, Unit 1: Evaluation of severe accident risk during mid-loop operations. Main report. Volume 6. Part 1.** Jo, J. (Brookhaven National Lab., Upton, NY (United States)); Lin, C.C.; Neymotin, L. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Technology; Brookhaven National Lab., Upton, NY (United States). May 1995. 142p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (BNL-NUREG–52399-Vol.6-Pt.1). Source: OSTI; NTIS; GPO; INIS.

During 1989, the Nuclear Regulatory Commission (NRC) initiated an extensive program to carefully examine the potential risks during low power and shutdown operations. The program includes two

parallel projects being performed by Brookhaven National Laboratory (BNL) and Sandia National Laboratories (SNL). Two plants, Surry (pressurized water reactor) and Grand Gulf (boiling water reactor), were selected as the plants to be studied. The objectives of the program are to assess the risks of severe accidents initiated during plant operational states other than full power operation and to compare the estimated core damage frequencies, important accident sequences and other qualitative and quantitative results with those accidents initiated during full power operation as assessed in NUREG-1150. The scope of the program includes that of a level-3 PRA. A phased approach was used in the level-1 program. In phase 1 which was completed in Fall 1991, a coarse screening analysis including internal fire and flood was performed for all plant operational states (POSs). The objective of the phase 1 study was to identify potential vulnerable plant configurations, to characterize (on a high, medium, or low basis) the potential core damage accident scenarios, and to provide a foundation for a detailed phase 2 analysis. In phase 2, mid-loop operation was selected as the plant configuration to be analyzed based on the results of the phase 1 study. The objective of the phase 2 study is to perform a detailed analysis of the potential accident scenarios that may occur during mid-loop operation, and compare the results with those of NUREG-1150. The results of the phase 2 level 2/3 study are the subject of this volume of NUREG/CR-6144, Volume 6.

23589 (WHC-SD-FF-QAPP–005-Rev.1) **Quality Assurance Program Plan for FFTF effluent controls. Revision 1.** Seamans, J.A. Westinghouse Hanford Co., Richland, WA (United States). 8 Jun 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014312. Source: OSTI; NTIS; INIS; GPO Dep.

This Quality Assurance Program Plan is specific to environmental related activities within the FFTF Property Protected Area. The activities include effluent monitoring and Low Level Waste Certification.

23590 (WSRC-TR–95-0219) **Assessment of Noble Gases in the Savannah River Site Environment.** Carlton, W.H.; Murphy, C.E. Jr. Westinghouse Savannah River Co., Aiken, SC (United States). Apr 1995. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060153. Source: OSTI; NTIS; GPO Dep.

A series of documents has been published that assesses the impact of various radionuclides released to the environment by Savannah River Site operations. The quantity released, the disposition of the radionuclides in the environment, and the dose to offsite individuals has been presented for carbon, cesium, iodine, plutonium, strontium, technetium, tritium, and uranium. An assessment of the impact of non-radioactive mercury also has been published.

The instrumentation and control of the Argon Cooling System (ACS) restricted fuel handling control system at Experimental Breeder Reactor II (EBR-II) is being upgraded from a system comprised of many discrete components and controllers to a computerized system with a graphical user interface (GUI). This paper describes the aspects of the upgrade including reasons for the upgrade, the old control system, upgrade goals, design decisions, philosophies and rationale, and the new control system hardware and software.

23592 (ANL/IFR/CP–84088) **EBR-II fuel handling console digital upgrade.** Peters, G.G. (Argonne National Lab., Idaho Falls, ID (United States). Integral Fast Reactor Operations Div.); Wiege, D.D.; Christensen, L.J. Argonne National Lab., IL (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950564–6: 9. symposium on power plant dynamics, control and testing, Knoxville, TN (United States), 24-26 May 1995). Order Number DE95013401. Source: OSTI; NTIS; INIS; GPO Dep.

The main fuel handling console and control system at the Experimental Breeder Reactor II (EBR-II) are being upgraded to a computerized system using high-end workstations for the operator interface and a programmable logic controller (PLC) for the control system. Two-dimensional (2D) and three-dimensional (3D) computer graphics will be provided for the operator which will show the relative position of under-sodium fuel handling equipment. This equipment is operated remotely with no means of directly viewing the transfer. This paper describes various aspects of the modification including reasons for the upgrade, capabilities the new system provides over the old control system, philosophies and rationale behind the new design, testing and simulation work, diagnostic features, and the advanced graphics techniques used to display information to the operator.

23593 (CONF-950740–49) **Prevention of non-ductile fracture in 6061-T6 aluminum nuclear pressure vessels.** Yahr, G.T. (Oak Ridge National Lab., TN (United States). Engineering Technology Div.). Oak Ridge National Lab., TN (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Joint ASME/JSME pressure vessels and piping conference; Honolulu, HI (United States); 23-27 Jul 1995. Order Number DE95013043. Source: OSTI; NTIS; INIS; GPO Dep.

The American Society of Mechanical Engineers (ASME) Boiler and Pressure Vessel Committee has approved rules for the use of 6061-T6 and 6061-T651 aluminum for the construction of Class 1 welded nuclear pressure vessels for temperatures not exceeding 149 C (300 F). Nuclear Code Case N-519 allows the use of this aluminum in the construction of low temperature research reactors such as the Advanced Neutron Source. The rules for protection against non-ductile fracture are discussed. The basis for a value of 25.3 MPa $\sqrt{m}$ (23 ksi $\sqrt{in.}$) for the critical or reference stress intensity factor for use in the fracture analysis is presented. Requirements for consideration of the effects of neutron irradiation on the fracture toughness are discussed.

23594 (CONF-9509100–2) **A small graphite-reflected UO_2 assembly.** Mihalczo, J.T. Oak Ridge National Lab., TN (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 5. international conference on nuclear criticality safety; Albuquerque, NM (United States); 17-22 Sep 1995. Order Number DE95014600. Source: OSTI; NTIS; INIS; GPO Dep.

An unmoderated, graphite-reflected, critical assembly of UO_2, enriched to 93.15 wt % in ^{235}U, is described. The UO_2 pellets (density, 9.71 g/cm^3) were contained in 253 1.27-cm-diam stainless steel tubes, which, in turn, are close packed in an aluminum container 22.87 cm in diameter and 31.11 cm long. This mockup of a small, potassium-cooled space power reactor, which was under study at Oak Ridge National Laboratory in 1963, provided data for validation of reactor physics methods. Two combinations of top and side reflectors were found to make the assembly critical. In one configuration, the thickness of the top and the side reflectors was 12.70 and 19.25 cm respectively; in the other, these dimensions were 5.08 and 24.34 cm. Fission distribution measurements axially through the assembly with the thicker radial reflector and radially through the reflector showed a peak in the reflector 3.5 greater than at the center of the core. The ^{235}U cadmium ratio measured in the side reflector at the core midplane for the assembly with the 19.25-cm-thick side reflector varied from 1.77 near the core boundary to 2.43 beyond 10 cm into the side reflector.

23595 (DOE/ER/75884–T1) **Nuclear safety analyses and core design calculations to convert the Texas A & M University Nuclear Science Center reactor to low enrichment uranium fuel. Final report.** Parish, T.A. Texas A and M Univ.,

College Station, TX (United States). Texas Engineering Experiment Station. 2 Mar 1995. 228p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-93ER75884. Order Number DE95015453. Source: OSTI; NTIS; GPO Dep.

This project involved performing the nuclear design and safety analyses needed to modify the license issued by the Nuclear Regulatory Commission to allow operation of the Texas A& M University Nuclear Science Center Reactor (NSCR) with a core containing low enrichment uranium (LEU) fuel. The specific type of LEU fuel to be considered was the TRIGA 20-20 fuel produced by General Atomic. Computer codes for the neutronic analyses were provided by Argonne National Laboratory (ANL) and the assistance of William Woodruff of ANL in helping the NSCR staff to learn the proper use of the codes is gratefully acknowledged. The codes applied in the LEU analyses were WIMSd4/m, DIF3D, NCTRIGA and PARET. These codes allowed full three dimensional, temperature and burnup dependent calculations modelling the NSCR core to be performed for the first time. In addition, temperature coefficients of reactivity and pulsing calculations were carried out in-house, whereas in the past this modelling had been performed at General Atomic. In order to benchmark the newly acquired codes, modelling of the current NSCR core with highly enriched uranium fuel was also carried out. Calculated results were compared to both earlier licensing calculations and experimental data and the new methods were found to achieve excellent agreement with both. Therefore, even if an LEU core is never loaded at the NSCR, this project has resulted in a significant improvement in the nuclear safety analysis capabilities established and maintained at the NSCR.

23596 (DOE/ER/79148–T1) **Reed Reactor Facility. Final report.** Frantz, S.G. Reed Coll., Portland, OR (United States). [1994]. 16p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States);USDOE, Washington, DC (United States);Oregon State Dept. of Energy, Salem, OR (United States). DOE Contract FG06-92ER79148. Order Number DE95015538. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the operation and maintenance of the Reed Reactor Facility. The Reed reactor is mostly used for education and train purposes.

23597 (DUN–4501) **Radiometallurgical examination of K5E fuel failures with behive growth in spires.** Toivonen, R.W. Douglas United Nuclear, Inc., Richland, WA (United States). 19 Jul 1968. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012652. Source: OSTI; NTIS; GPO Dep.

On September 18, 1967, KE Reactor experienced,a failure in a K5E fuel element in tube 2863, exposure 634 Mwd/t. On September 24, 1967, two additional failures occurred. All of these elements, clad with X8001 alloy were from the same canning lot. All fuel elements from this canning lot were termed rupture-prone and were discharged. The elements from five columns including column 2863, but neither columns 2865 nor 3256, were sent to 105-C Basin Fuel Examination Facility for further examination. An incipient failure was found and sent to Radiometallurgy in an effort to determine the cause of failure. During the course of examination, the spire was found to contain beehive-shaped growths approximately 1/8-inch high and 1/8-inch 9 in diameter at the base. The incipient failure contained four of these growths protruding from the spire wall. Closer examination showed that the spire contained numerous other "beehives" in less advanced stages of growth. The ruptured element from 2863 also contained a "beehive". The second section of this report covers examination of several "beehives" and presents information concerning the possible cause or causes of growth.

23600 (JAERI-Review–95-005) **Feasibility study on potential productivity of heat-resisting and advanced semiconductors by using the HTTR.** Shibata, Taiju (Japan Atomic Energy Research Inst., Oarai, Ibaraki (Japan). Oarai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 91p. (In Japanese). Order Number DE95789318. Source: OSTI; NTIS; INIS.

Worldwide attention has been paid to GaAs and SiC as a kind of the heat-resisting and advanced semiconductor materials. Doping of specific impurities into semiconductor materials is a key technology for producing semiconductor devices. As one of doping technologies, thermal diffusional doping has been successfully applied to Si. Application of thermal diffusional doping to GaAs needs expensive and complicated processes in order to prevent an occurrence of lattice defects by impurities. On the other hand, it is difficult to apply this technology to SiC, because of small diffusion coefficient of impurities to SiC. Therefore, it is of great importance to develop a substitutional doping technology for these materials for realizing heat-resisting and advanced semiconductor. To dope some impurities into Si crystal by using neutron irradiation is a mature technology and is called NTD. The High Temperature engineering Test Reactor(HTTR) has an unique and superior capability to irradiate large-sized specimen, in the order of 10cm in diameter, at high temperature up to approximately 1000degC. This report presents a result of feasibility study of potential applicability and effectiveness of NTD to GaAs and SiC at the HTTR. First of all, advantages and disadvantages were identified by reviewing the state-of-the-art technology of NTD to Si. Potential applicability of NTD to GaAs and SiC are discussed. Based on this discussion, effectiveness and feasibility of NTD to these materials at the HTTR are examined. As a result, NTD is feasible to SiC but not to GaAs. The HTTR provides the capability to produce SiC semiconductor, in particular, to produce the semiconductor with (1) low irradiation damage, (2) uniform distribution of doped impurities and (3) high productivity, if a large-sized SiC crystal is capable to be commercialized. Practical application of NTD at the HTTR will be discussed in the next study. (author).

23601 (JAERI-Tech–95-002) **Neutronic analysis of JRR-4 with low enriched uranium silicon dispersion type fuel of 3.8g/cm^3 uranium density.** Nakano, Yoshihiro (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1995. 69p. (In Japanese). Order Number DE95789261. Source: OSTI; NTIS; INIS.

Neutronic Analysis of JRR-4 has been performed under the reduced enrichment program of the research reactors. The fuel selected is low enriched uranium silicon dispersion type (silicide fuel) and its uranium density is 3.8g/cm^3. Almost of calculations were done using the SRAC code system developed by JAERI. The results obtained by the calculations are as follows. The reactor core has enough excess reactivity within the range to control and operate the reactor safely. Moderator void, moderator temperature and fuel temperature reactivity coefficients are always negative. Neutron fluxes in irradiation pipes are almost same level as the present core. As a result, the use of the silicide fuel of 3.8g/cm^3 uranium density has been shown to be satisfactory for the core performance required in JRR-4, and has been adopted with the final decision. (author).

23602 (JAERI-Tech–95-020) **Results of physics measurement of the low-enriched uranium fuel core in the JMTR.** Komori, Yoshihiro; Simakawa, Satoshi; Komukai, Bunsaku; Nagao,

Yoshiharu; Akashi, Kazutomo; Sakurai, Fumio. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 69p. (In Japanese). Order Number DE95789302. Source: OSTI; NTIS; INIS.

Reducing enrichment program has been proceeding also in the Japan Atomic Energy Research Institute along with international non-proliferation policy, and the JMTR was fully converted to the low-enriched uranium (LEU) fuel in January, 1994. The silicide fuel with uranium density of 4.8g/cc is used for the JMTR, and cadmium wires are placed in the side plates of the fuel elements as burnable absorber. Based on results of physics measurement on the JMTR LEU fuel core, sufficient shutdown capability and negative reactivity feedback effect were assured. Excess capability and negative reactivity feedback effect were assured. Excess reactivity at the beginning of the operation cycle was maintained at the same level as the previous medium-enriched uranium fuel core due to reactivity effect of the cadmium wires. Excess reactivity change during reactor operation agreed well with the predicted value. (author).

23603 (JAERI-Tech–95-023) **Neutronics analysis on helium production control in stainless steel by neutron spectral tailoring in the JMTR.** Shimakawa, Satoshi (Japan Atomic Energy Research Inst., Oarai, Ibaraki (Japan). Oarai Research Establishment); Komori, Yoshihiro; Nagao, Yoshiharu; Sakurai, Fumio. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 31p. (In Japanese). Order Number DE95789317. Source: OSTI; NTIS; INIS.

With regard to development of neutron spectral tailoring irradiation technique in the JMTR, helium production control range in 304 stainless steel was calculated under constant neutron fluence represented in dpa. Using a technique for enhancing helium production by $^{8}Ni(n,\gamma)^{59}Ni(n,\alpha)^{56}Fe$ reaction, following three irradiation tests were surveyed to estimate helium production control range; (1) thermal neutron cut-off irradiation with cadmium absorber. (2) normal irradiation without considering spectral tailoring, (3) thermal neutron trapping irradiation with graphite moderator. For 200 day irradiation test, helium production in 304 stainless steel is able to be controlled within 1.4-24 appm (2 dpa, He-to-dpa ratio within 0.7-12). Based on the calculation results, it was found that the improved irradiation tests to obtain irradiation data with different helium production is feasible in the JMTR for studies on helium effects in nickel-bearing materials. (author).

23604 (ORNL/M–3563) **HRB-22 preirradiation thermal analysis.** Acharya, R.; Sawa, K. Oak Ridge National Lab., TN (United States). May 1995. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95013507. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the preirradiation thermal analysis of the HRB-22 capsule designed for irradiation in the removable beryllium (RB) position of the High Flux Isotope Reactor (HFIR) at Oak Ridge National Laboratory (ORNL). CACA-2 a heavy isotope and fission product concentration calculational code for experimental irradiation capsules was used to determine time dependent fission power for the fuel compacts. The Heat Engineering and Transfer in Nine Geometries (HEATING) computer code, version 7.2, was used to solve the steady-state heat conduction problem. The diameters of the graphite fuel body that contains the compacts and the primary pressure vessel were selected such that the requirements of running the compacts at an average temperature of $< 1,250$ C and not exceeding a maximum fuel temperature of 1,350 C was met throughout the four cycles of irradiation.

23605 (ORNL/M–3738) **Detailed flux calculations for the conceptual design of the Advanced Neutron Source Reactor.** Wemple, C.A. (EG and G Idaho, Inc., Idaho Falls, ID (United States)). Oak Ridge National Lab., TN (United States). May 1995. 772p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95016131. Source: OSTI; NTIS; INIS; GPO Dep.

A detailed MCNP model of the Advanced Neutron Source Reactor has been developed. All reactor components inside the reflector tank were included, and all components were highly segmented. Neutron and photon multigroup flux spectra have been calculated for each segment in the model, and thermal-to-fast neutron flux ratios were determined for each component segment. Axial profiles of the spectra are provided for all components of the reactor. Individual segment statistical uncertainties were limited wherever possible, and the group fluxes for all important reflector components have a standard deviation below 10%.

23606 (ORNL/M–3993) **Detailed heat load calculations at the beginning, middle, and end of cycle for the conceptual design of the Advanced Neutron Source Reactor.** Wemple, C.A. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Schnitzler, B.G. Oak Ridge National Lab., TN (United States). Feb 1995. 212p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95012539. Source: OSTI; NTIS; INIS; GPO Dep.

The Advanced Neutron Source (ANS) is a world-class research reactor and experimental center for neutron research, presently being designed at the Oak Ridge National Laboratory (ORNL). The reactor consists of a 330-MW(f) highly enriched uranium core, which is cooled, moderated, and reflected with heavy water. When completed, it will be the preeminent ultrahigh neutron flux reactor in the world, with facilities for research programs in biology, materials science, chemistry, fundamental and nuclear physics, and analytical chemistry. Irradiation facilities are provided for a variety of isotope production capabilities, as well as materials irradiation. The ANS reactor design, at the time of this report, has completed the conceptual design phase and entered the advanced conceptual design phase. This report is part of an effort to fully document the analysis methods and results for the conceptual design. It details the methods used to perform heat load calculations on the ANS reactor design, describes the model used, and gives the resulting heat loads in all components of the reactor, in both a differential (by segment) and integral (by component) fashion. These heat load data are provided at three times within the ANS fuel cycle - at beginning (0 days), middle (8.5 days), and end (17 days) of cycle. The remainder of the report is dedicated to this description. In Chapter 2, some necessary background on the reactor design is provided. Chapters 3 and 4 give details of the depletion methods used and revisions to previous MCNP models. Chapter 5 analyzes the results of these calculations, and Chapter 6 provides a summary and conclusions.

23607 (SAND–95-1107C) **Observations of the boiling process from a downward-facing torispherical surface: Confirmatory testing of the heavy water new production reactor flooded cavity design.** Chu, T.Y.; Bentz, J.H.; Simpson, R.B. Sandia National Labs., Albuquerque, NM (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950828–12: National heat transfer conference, Portland, OR (United States), 5-9 Aug 1995). Order Number DE95013031. Source: OSTI; NTIS; INIS; GPO Dep.

Reactor-scale ex-vessel boiling experiments were performed in the CYBL facility at Sandia National Laboratories. The boiling flow pattern outside the RPV bottom head shows a center pulsating region and an outer steady two-phase boundary layer region. The local heat transfer data can be correlated in terms of a modified Rohsenow correlation.

23608 (WHC-SD-FF-CSWD–055-Rev.1) **R-1 (C-620-A) and R-2 (C-620-B) air compressor control logic, computer software description. Revision 1.** Walter, K.E. Westinghouse Hanford Co., Richland, WA (United States). 8 Jun 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014314. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides an updated computer software description for the software used on the FFTF R-1 (C-620-A) and R-2 (C-620-B) air compressor programmable controllers. Logic software design changes were required to allow automatic starting of a compressor that had not been previously started.

23609 (WHC-SD-FF-CSWD–056-Rev.1) **R-189 (C-620) air compressor control logic software documentation. Revision 1.** Walter, K.E. Westinghouse Hanford Co., Richland, WA (United States). 8 Jun 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014313. Source: OSTI; NTIS; INIS; GPO Dep.

This relates to FFTF plant air compressors. Purpose of this document is to provide an updated Computer Software Description for the software to be used on R-189 (C-620-C) air compressor

programmable controllers. Logic software design changes were required to allow automatic starting of a compressor that had not been previously started.

23610 (WHC-SD-FF-MAR–001) **FFTF Plant transition mission analysis report.** Lund, D.P. Westinghouse Hanford Co., Richland, WA (United States). 25 May 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013564. Source: OSTI; NTIS; INIS; GPO Dep.

FFTF (Fast Flux Test Facility) is a 400-MW(t) sodium-cooled, fast flux test reactor at Hanford, designed to test fuels and materials for advanced nuclear power plants; it has no capability for generating electric power. Since a long-term mission could not be found for FFTF, it was placed in standby, and a recommendation was made that it be shut down. Purpose of the FFTF Transition Project is to prepare it for Decontamination and Decommissioning; this will be accomplished by establishing a passively safe and environmentally secure configuration, that can be preserved for several decades. This report presents the results of the mission analysis, which is required by Hanford systems engineering procedures.

23611 (ANL/ET/CP–83008) **Review of behavior of mixed-oxide fuel elements in extended overpower transient tests in EBR-II.** Tsai, H. (Argonne National Lab., IL (United States). Energy Technology Div.); Neimark, L.A.; Nagai, S.; Nakae, N. Argonne National Lab., IL (United States). Oct 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950426–5: 3. international conference on nuclear engineering, Kyoto (Japan), 23-27 Apr 1995). Order Number DE95013682. Source: OSTI; NTIS; INIS; GPO Dep.

From a series of five tests conducted in EBR-II, a substantial data base has been established on the performance of mixed-oxide fuel elements in a liquid-metal-cooled reactor under slow-ramp transient overpower conditions. Each test contained 19 preirradiated fuel elements with varying design and prior operating histories. Elements with aggressive design features, such as high fuel smear density and/or thin cladding, were included to accentuate transient effects. The ramp rates were either 0.1 or 10% $\Delta P/P/s$ and the overpowers ranged between $\approx$60 and 100% of the elements' prior power ratings. Six elements breached during the tests, all with aggressive design parameters. The other elements, including all those with moderate design features for the reference or advanced long-life drivers for PNC's prototype fast reactor Monju, maintained their cladding integrity during the tests. Posttest examination results indicated that fuel/cladding mechanical interaction (FCMI) was the most significant mechanism causing the cladding strain and breach. In contrast, pressure loading from the fission gas in the element plenum was less important, even in high-burnup elements. During an overpower transient, FCMI arises from fuel/cladding differential thermal expansion, transient fuel swelling, and, significantly, the gas pressure in the sealed central cavity of elements with substantial centerline fuel melting. Fuel performance data from these tests, including cladding breaching margin and transient cladding strain, are correlatable with fuel-element design and operating parameters. These correlations are being incorporated into fuel-element behavior codes. At the two tested ramp rates, fuel element behavior appears to be insensitive to transient ramp rate and there appears to be no particular vulnerability to slow ramp transients as previously perceived.

23612 (ANL/IFR/CP–85456) **Probabilistic techniques using Monte Carlo sampling for multi- component system diagnostics.** Aumeier, S.E. (Argonne National Lab., Idaho Falls, ID (United States)); Lee, J.C.; Akcasu, A.Z. Argonne National Lab., Idaho Falls, ID (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38 ; FG02-92ER75712. (CONF-950420–25: International conference on mathematics and computations, reactor physics, and environmental analyses, Portland, OR (United States), 30 Apr - 4 may 1995). Order Number DE95012283. Source: OSTI; NTIS; INIS; GPO Dep.

We outline the structure of a new approach at multi-component system fault diagnostics which utilizes detailed system simulation models, uncertain system observation data, statistical knowledge of system parameters, expert opinion, and component reliability data in an effort to identify incipient component performance degradations of arbitrary number and magnitude. The technique involves the use of multiple adaptive Kalman filters for fault estimation, the results of which are screened using standard hypothesis testing procedures to define a set of component events that could have transpired. Latin Hypercube sample each of these feasible component events in terms of uncertain component reliability data and filter estimates. The capabilities of the procedure are demonstrated through the analysis of a simulated small magnitude binary component fault in a boiling water reactor balance of plant. The results show that the procedure has the potential to be a very effective tool for incipient component fault diagnosis.

23613 (BNL–52445-Rev.1-(FORMAL)) **Aircraft impact analysis for the HFBR. Revision 1.** Stock, D.; Biele, F. Brookhaven National Lab., Upton, NY (United States). Feb 1993. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95011784. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents an analysis performed to determine the annual frequency at which aircraft are expected to strike the High Flux Beam Reactor (HFBR) complex, located at Brookhaven National Laboratory. Since the HFBR is not hardened against light aircraft, this report considers the impact of military, commercial, twin engine and knee engine aircraft operating in the vicinity of the HFBR. The large volume of light aircraft operating in this area contributes heavily to the estimated annual impact frequency of 3.54E-05 impacts per year. There are two chapters and seven appendices in this report. The first chapter describes the airspace in the vicinity of the HFBR. This includes five airports, two major airways, one standard arrival route, as well as a significant volume of radar vectored and air-taxi traffic. The second chapter of this report presents the calculations by which the expected impact frequency was derived, and an assessment of the uncertainty in those calculations. The calculations were performed using the method outlined in the NRC Standard Review Plan. A separate set of calculations is presented for each of three sources of aircraft: airway traffic, Brookhaven Airport, and Calverton Airport. The appendices contain discussions and side calculations ancillary to the presentation in the second section. This includes a discussion of the data used to estimate traffic counts, information on accident rates, and several other points which would have only been distracting if included in the main discussion.

23614 (CONF-950564–1) **Design and testing of integrated circuits for reactor protection channels.** Battle, R.E. (Oak Ridge National Lab., TN (United States)); Vandermolen, R.I.; Jagadish, U.; Swail, B.K.; Naser, J. Oak Ridge National Lab., TN (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States);Electric Power Research Inst., Palo Alto, CA (United States). DOE Contract AC05-84OR21400. From 9. symposium on power plant dynamics, control and testing; Knoxville, TN (United States); 24-26 May 1995. Order Number DE95013224. Source: OSTI; NTIS; INIS; GPO Dep.

Custom and semicustom application-specific integrated circuit design and testing methods are investigated for use in research and commercial nuclear reactor safety systems. The Electric Power Research Institute and Oak Ridge National Laboratory are working together through a cooperative research and development agreement to apply modern technology to a nuclear reactor protection system. The purpose of this project is to demonstrate to the nuclear industry an alternative approach for new or upgrade reactor protection and safety system signal processing and voting logic. Motivation for this project stems from (1) the difficulty of proving that software-based protection systems are adequately reliable, (2) the obsolescence of the original equipment, and (3) the improved performance of digital processing. A demonstration model for protection system of PWR reactor has been designed and built.

23615 (DOE/ER/12900–1) **Characterization of jet breakup mechanisms observed from simulant of molten fuel pentrating coolant. Technical progress report, 1989–1990.** Jones, B.G. Illinois Univ., Urbana, IL (United States). Dept. of Nuclear Engineering. [1990]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER12900. Order Number DE95014739. Source: OSTI; NTIS; GPO Dep.

The objective of the proposed experiments is to replicate approximately, by injecting low melting point metal alloys into Freon-11 and liquid nitrogen, the dispersal of corium streams in water. To first gain a better understanding of the corium dispersal process to be simulated, experimental data from the CCM experiments, in which the injection of streams of molten corium into water was studied, was interpreted in cooperation with Argonne National Laboratory (ANL) staff. The results of these experiments are discussed briefly below. This is followed by a description of the preparations made to date for the present simulant experiments.

23616 (ENEA-RT-INN–95-09) **Decommissioning of IFEC.** Ceccotti, G. (ENEA, Saluggia (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Sberze, L. ENEA, Saluggia (Italy). Centro Ricerche Energia - Area Energia e Innovazione. May 1995. 54p. (In Italian). Order Number DE95789754. Source: OSTI; NTIS (US Sales Only).

The IFEC nuclear fuel fabrication plant operated in Italy for more then thirty years and has now been successfully decommissioned. The rules and regulations relating to Quality Assurance established during the fabrication of Cirene reactor fuel have been adhered to during the decommissioning phase. The use of personnel with large experience in the nuclear field has resulted in vast majority of cares of material and apparatus to be reutilized in conventional activities without the need of calling on the assistence of external firms. The whole decontamination process was successfully completed on time and in particular the quantity of contaminated wastes was kept to eminimun.

23617 (FZR–84) **Development and verification of a three-dimensional core model for WWR type reactors and its coupling with the accident code ATHLET. Final report.** Grundmann, U.; Lucas, D.; Mittag, S.; Rohde, U. Forschungszentrum Rossendorf e.V. (FZR), Rossendorf bei Dresden (Germany). Apr 1995. 128p. (In German). Sponsored by Bundesministerium fuer Bildung, Wissenschaft, Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMBF 1500925. Order Number DE95795719. Source: OSTI; NTIS (US Sales Only); INIS.

The main goal of the project was the coupling of the 3D core model DYN3D for Russian VVER-type reactors, which has been developed in the RCR, with the thermohydraulic code ATHLET. The coupling has been realized on two basically different ways: - The implementation of only the neutron kinetics model of DYN3D into ATHLET (internal coupling), - the connection of the complete DYN3D core model including neutron kinetics, thermohydraulics and fuel rod model via data interfaces at the core top and bottom (external coupling). For the test of the coupling, comparative calculations between internal and external coupling versions have been carried out for a LOCA and a reactivity transient. Complementary goals of the project were: - The development of a DYN3D version for burn-up calculations, - the verification of DYN3D on benchmark tasks and experimental data on fuel rod behaviour, - a study on the extension of the neutron-physical data base. The project contributed to the development of advanced tools for the safety analysis of VVER-type reactors. Future work is aimed to the verification of the coupled code complex DYN3D-ATHLET. (orig.)

23618 (IKE–2-110) **Verification of KESS-III using PHEBUS in-pile experiments. Status report. Verification and completion of KESS-III.** Hocke, K.D.; Kronenberg, J.; Mueller, K.; Schlenkrich, C.; Schatz, A. Stuttgart Univ. (Germany). Inst. fuer Kernenergetik und Energiesysteme. May 1994. 74p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 1500750A. Order Number DE95795737. Source: OSTI; NTIS (US Sales Only); INIS.

The Phebus SFD test objectives were related to the early phases of severe accidents core heatup and degradation, comprising processes which become relevant prior to the onset of significant core degradation in the reactor core or bundle region. The orientation of the Phebus SFD test matrix on code development and verification needs, with appropriate measurements and post-test examinations, made these tests particularly suitable for verification of physical models and their interactions as well as for the improvement of applicability of the entire KESS code system. A brief summary of pre-test calculations in support of the Phebus FP programme is also included. These analyses aimed at verifying the dimensioning and test procedures of the first experiment FPT-0 conducted at the end of 1993, comprising code-to-code comparisons with a number of code systems available internationally. IKE participation to the International Standard Problem ISP-No.28 (Phebus test B9+) and in activities of the Phebus-related scientific working groups GTI (Phebus SFD) and SAWG (Phebus FP) allowed further model and code comparison on an international level, leading to additional improvement and extension of KESS model details, code optimization, data acquisition and post processing tools. (orig./HP)

23619 (LA-UR–93-3564) **Assessment of the PIUS physics and thermal-hydraulic experimental data bases.** Boyack, B.E. (Los Alamos National Lab., NM (United States). Technology and Safety Assessment Div.). Los Alamos National Lab., NM (United States). [1993]. 130p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95014572. Source: OSTI; NTIS; INIS; GPO Dep.

The PIUS reactor utilizes simplified, inherent, passive, or other innovative means to accomplish safety functions. Accordingly, the PIUS reactor is subject to the requirements of 10CFR52.47(b)(2)(i)(A). This regulation requires that the applicant adequately demonstrate the performance of each safety feature, interdependent effects among the safety features, and a sufficient data base on the safety features of the design to assess the analytical tools used for safety analysis. Los Alamos has assessed the quality and completeness of the existing and planned data bases used by Asea Brown Boveri to validate its safety analysis codes and other relevant data bases. Only a limited data base of separate effect and integral tests exist at present. This data base is not adequate to fulfill the requirements of 10CFR52.47(b)(2)(i)(A). Asea Brown Boveri has stated that it plans to conduct more separate effect and integral test programs. If appropriately designed and conducted, these test programs have the potential to satisfy most of the data base requirements of 10CFR52.47(b)(2)(i)(A) and remedy most of the deficiencies of the currently existing combined data base. However, the most important physical processes in PIUS are related to reactor shutdown because the PIUS reactor does not contain rodded shutdown and control systems. For safety-related reactor shutdown, PIUS relies on negative reactivity insertions from the moderator temperature coefficient and from boron entering the core from the reactor pool. Asea Brown Boveri has neither developed a direct experimental data base for these important processes nor provided a rationale for indirect testing of these key PIUS processes. This is assessed as a significant shortcoming. In preparing the conclusions of this report, test documentation and results have been reviewed for only one integral test program, the small-scale integral tests conducted in the ATLE facility.

23620 (LA-UR–95-1594) **Updated TRAC analysis of an 80% double-ended cold-leg break for the AP600 design.** Lime, J.F. (Los Alamos National Lab., NM (United States). Technology and Safety Assessment Div.); Boyack, B.E. Los Alamos National Lab., NM (United States). [1995]. 152p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95015287. Source: OSTI; NTIS; INIS; GPO Dep.

An updated TRAC 80% large-break loss-of-coolant accident (LBLOCA) has been calculated for the Westinghouse AP600 advanced reactor design, The updated calculation incorporates major code error corrections, model corrections, and plant design changes. The 80% break size was calculated by Westinghouse to be the most severe large-break size for the AP600 design. The LBLOCA transient was calculated to 144 s. Peak cladding temperatures (PCTS) were well below the Appendix K limit of 1,478 K (2,200 F), but very near the cladding oxidation temperature of 1,200 K (1,700 F). Transient event times and PCT for the TRAC calculation were in reasonable agreement with those calculated by

Westinghouse using their WCOBRA/TRAC code. However, there were significant differences in the detailed phenomena calculated by the two codes, particularly during the blowdown phase. The reasons for these differences are still being investigated. Additional break sizes and break locations need to be analyzed to confirm the most severe break postulated by Westinghouse.

23621 (NUREG–0847-Suppl.-No.15) **Safety evaluation report related to the operation of Watts Bar Nuclear Plant, Units 1 and 2 (Docket Nos. 50-390 and 50-391). Supplement No. 15.** Tam, P.S. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Reactor Projects I/II. Jun 1995. 184p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

This report supplements the Safety Evaluation Report (SER), NUREG-0847 (June 1982), Supplement No. 1 (September 1982), Supplement No. 2 (January 1984), Supplement No. 3 (January 1985), Supplement No. 4 (March 1985), Supplement No. 5 (November 1990), Supplement No. 6 (April 1991), Supplement No. 7 (September 1991), Supplement No. 8 (January 1992), Supplement No. 9 (June 1992), Supplement No. 10 (October 1992), Supplement No. 11 (April 1993), Supplement No. 12 (October 1993), Supplement No. 13 (April 1994), and Supplement No. 14 (December 1994) issued by the Office of Nuclear Reactor Regulation of the US Nuclear Regulatory Commission with respect to the application filed by the Tennessee Valley Authority, as applicant and owner, for licenses to operate the Watts Bar Nuclear Plant, Units 1 and 2 (Docket Nos. 50-390 and 50-391). The facility is located in Rhea County, Tennessee, near the Watts Bar Dam on the Tennessee River. This supplement provides recent information regarding resolution of some of the outstanding and confirmatory items, and proposed license conditions identified in the SER.

23622 (NUREG–1430-Vol.3-Rev.1) **Standard technical specifications: Babcock and Wilcox plants. Volume 3, Revision 1: Bases (Sections 3.4–3.9).** Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Reactor Regulation. Apr 1995. 381p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS.

This report documents the results of the combined effort of the NRC and the industry to produce improved Standard Technical Specifications (STS), Revision 1 for Babcock and Wilcox Plants. The changes reflected in Revision 1 resulted from the experience gained from license amendment applications to convert to these improved STS or to adopt partial improvements to existing technical specifications. This NUREG is the result of extensive public technical meetings and discussions between the Nuclear Regulatory Commission (NRC) staff and various nuclear power plant licensees, Nuclear Steam Supply System (NSSS) Owners Groups, NSSS vendors, and the Nuclear Energy Institute (NEI). The improved STS were developed based on the criteria in the Final Commission Policy Statement on Technical Specifications Improvements for Nuclear Power Reactors, dated July 22, 1993. The improved STS will be used as the basis for individual nuclear power plant licensees to develop improved plant-specific technical specifications. This report contains three volumes. Volume 1 contains the Specifications for all chapters and sections of the improved STS. Volume 2 contains the Bases for Chapters 2.0 and 3.0, and Sections 3.1–3.3 of the improved STS. Volume 3 contains the Bases for Sections 3.4–3.9 of the improved STS.

23623 (NUREG–1432-Vol.1-Rev.1) **Standard technical specifications: Combustion engineering plants. Volume 1, Revision 1: Specifications.** Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Reactor Regulation. Apr 1995. 433p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

This report documents the results of the combined effort of the NRC and the industry to produce improved Standard Technical Specifications (STS), Revision 1 for Combustion Engineering Plants. The changes reflected in Revision 1 resulted from the experience gained from license amendment applications to convert to these improved STS or to adopt partial improvements to existing technical specifications. This NUREG is the result of extensive public technical meetings and discussions between the Nuclear Regulatory Commission (NRC) staff and various nuclear power plant licensees, Nuclear Steam Supply System (NSSS) Owners Groups, NSSS vendors, and the Nuclear Energy Institute (NEI). The improved STS were developed based on the criteria in the Final Commission Policy Statement on Technical Specifications Improvements for Nuclear Power Reactors, dated July 22, 1993. The improved STS will be used as the basis for individual nuclear power plant licensees to develop improved plant-specific technical specifications. This report contains three volumes. Volume 1 contains the Specifications for all chapters and sections of the improved STS. Volume 2 contains the Bases for Chapters 2.0 and 3.0, and Sections 3.1–3.3 of the improved STS. Volume 3 contains the Bases for Sections 3.4–3.9 of the improved STS.

23626 (NUREG–1526) **Lessons learned from early implementation of the maintenance rule at nine nuclear power plants.** Petrone, C.D.; Correia, R.P.; Black, S.C. Nuclear Regulatory Commission, Washington, DC (United States). Div. of

Technical Support. Jun 1995. 34p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

This report summarizes the lessons learned from the nine pilot site visits that were performed to review early implementation of the maintenance rule using the draft NRC Maintenance Inspection Procedure. Licensees followed NUMARC 93-01, "Industry Guideline for Monitoring the Effectiveness of Maintenance at Nuclear Power Plants." In general, the licensees were thorough in determining which structures, systems, and components (SSCS) were within the scope of the maintenance rule at each site. The use of an expert panel was an appropriate and practical method of determining which SSCs are risk significant. When setting goals, all licensees considered safety but many licensees did not consider operating experience throughout the industry. Although required to do so, licensees were not monitoring at the system or train level the performance or condition for some systems used in standby service but not significant to risk. Most licensees had not established adequate monitoring of structures under the rule. Licensees established reasonable plans for doing periodic evaluations, balancing unavailability and reliability, and assessing the effect of taking equipment out of service for maintenance. However, these plans were not evaluated because they had not been fully implemented at the time of the site visits.

23627 (NUREG/CR–5857) **Aging of turbine drives for safety-related pumps in nuclear power plants.** Cox, D.F. (Oak Ridge National Lab., TN (United States)). Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering Technology; Oak Ridge National Lab., TN (United States). Jun 1995. 50p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). (ORNL–6713). Source: OSTI; NTIS; GPO; INIS.

This study was performed to examine the relationship between time-dependent degradation and current industry practices in the areas of maintenance, surveillance, and operation of steam turbine drives for safety-related pumps. These pumps are located in the Auxiliary Feedwater (AFW) system for pressurized-water reactor plants and in the Reactor Core Isolation Cooling and High-Pressure Coolant Injection systems for boiling-water reactor plants. This research has been conducted by examination of failure data in the Nuclear Plant Reliability Data System, review of Licensee Event Reports, discussion of problems with operating plant personnel, and personal observation. The reported failure data were reviewed to determine the cause of the event and the method of discovery. Based on the research results, attempts have been made to determine the predictability of failures and possible preventive measures that may be implemented. Findings in a recent study of AFW systems indicate that the turbine drive is the single largest contributor to AFW system degradation. However, examination of the data shows that the turbine itself is a reliable piece of equipment with a good service record. Most of the problems documented are the result of problems with the turbine controls and the mechanical overspeed trip mechanism; these apparently stem from three major causes which are discussed in the text. Recent improvements in maintenance practices and procedures, combined with a stabilization of the design, have led to improved performance resulting in a reliable safety-related component. However, these improvements have not been universally implemented.

23628 (NUREG/CR–5954) **Effect of aging on the PWR Chemical and Volume Control System.** Grove, E.J. (Brookhaven National Lab., Upton, NY (United States)); Travis, R.J.; Aggarwal, S.K. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering Technology; Brookhaven National Lab., Upton, NY (United States). Jun 1995. 185p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (BNL-NUREG–52410). Source: OSTI; NTIS; GPO; INIS.

The PWR Chemical and Volume Control System (CVCS) is designed to provide both safety and non-safety related functions. During normal plant operation it is used to control reactor coolant chemistry, and letdown and charging flow. In many plants, the charging pumps also provide high pressure injection, emergency boration, and RCP seal injection in emergency situations. This study examines the design, materials, maintenance, operation and actual degradation experiences of the system and main subcomponents to assess the potential for age degradation. A detailed review of the Nuclear Plant Reliability Data System (NPRDS) and Licensee Event Report (LER) databases for the 1988–1991 time period, together with a review of industry and NRC experience and research, indicate that age-related degradations and failures have occurred. These failures had significant effects on plant operation, including reactivity excursions, and pressurizer level transients. The majority of these component failures resulted in leakage of reactor coolant outside the containment. A representative plant of each PWR design (W, CE, and B and W) was visited to obtain specific information on system inspection, surveillance, monitoring, and inspection practices. The results of these visits indicate that adequate system maintenance and inspection is being performed. In some instances, the frequencies of inspection were increase in response to repeated failure events. A parametric study was performed to assess the effect of system aging on Core Damage Frequency (CDF). This study showed that as motor-operated valve (MOV) operating failures increased, the contribution of the High Pressure Injection to CDF also increased.

23629 (NUREG/CR–6144-Vol.6-Pt.2) **Evaluation of potential severe accidents during low power and shutdown operations at Surry, Unit 1: Evaluation of severe accident risk during mid-loop operations. Volume 6, Part 2: Appendices.** Jo, J. (Brookhaven National Lab., Upton, NY (United States)); Lin, C.C.; Neymotin, L.; Mubayi, V. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Technology; Brookhaven National Lab., Upton, NY (United States). May 1995. 242p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (BNL-NUREG–52399-Vol.6-Pt.2). Source: OSTI; NTIS; GPO; INIS.

The objectives are to assess the risks of severe accidents initiated during plant operational states other than full power operation and to compare the estimated core damage frequencies, important accident sequences and other qualitative and quantitative results with those accidents initiated during full power operation. In phase 2, mid-loop operation was selected as the plant configuration to be analyzed. Volume 1 summarizes the results of the study. The scope of the level-1 study includes plant damage state analyses, and uncertainty analysis. The internal event analysis is documented in Volume 2. The internal fire and internal flood analysis are documented in Volumes 3 and 4, respectively. A separate study on seismic analysis, documented in Volume 5, was performed for the NRC by Future Resources Associated, Inc. A phased approach was used in the level 2/3 PRA program, however both phases addressed the risk from only mid-loop operation. The first phase of the level 2/3 PRA was initiated in late 1991 and consisted of an Abridged Risk Study. This study was completed in May 1992 and was focused on accident progression and consequences, conditional on core damage. Phase 2 is a more detailed study in which an evaluation of risk during mid-loop operation was performed. The results of the phase 2 level 2/3 study are the subject of this volume of NUREG/CR-6144, Volume 6. This report, Volume 6, Part 2, consists of five appendices containing supporting information for: the PDS (plant damage state) analysis; the accident progression analysis; the source term analysis; the consequence analysis; and the Melcor analysis. 73 figs., 21 tabs.

23630 (NUREG/CR–6174-Vol.1) **Revised analyses of decommissioning for the reference boiling water reactor power station. Effects of current regulatory and other considerations on the financial assurance requirements of the decommissioning rule and on estimates of occupational radiation exposure: Main report, draft report for comment. Volume 1.** Smith, R.I. (Pacific Northwest Lab., Richland, WA (United States)); Bierschbach, M.C.; Konzek, G.J. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications. Sep 1994. 144p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC06-76RL01830. (PNL–9975-Vol.1). Source: OSTI; NTIS; GPO; INIS.

On June 27, 1988, the U.S. Nuclear Regulatory Commission (NRC) published in the Federal Register (53 FR 24018) the final rule for the General Requirements for Decommissioning Nuclear

Facilities. With the issuance of the final rule, owners and operators of licensed nuclear power plants are required to prepare, and submit to the NRC for review, decommissioning plans and cost estimates. The NRC staff is in need of updated bases documentation that will assist them in assessing the adequacy of the licensee submittals, from the viewpoint of both the planned actions, including occupational radiation exposure, and the probable costs. The purpose of this reevaluation study is to update the needed bases documentation. This report presents the results of a review and reevaluation of the PNL 1980 decommissioning study of the Washington Public Power Supply System's Washington Nuclear Plant Two (WNP-2), including all identifiable factors and cost assumptions which contribute significantly to the total cost of decommissioning the plant for the DECON, SAFSTOR, and ENTOMB alternatives, which now include an initial 5-7 year period during which time the spent fuel is stored in the spent fuel pool prior to beginning major disassembly or extended safe storage of the plant. This report also includes consideration of the NRC requirement that decontamination and decommissioning activities leading to termination of the nuclear license be completed within 60 years of final reactor shutdown, consideration of packaging and disposal requirements for materials whose radionuclide concentrations exceed the limits for Class C low-level waste. Costs for labor, transport, and disposal activities are given in 1993 dollars. Sensitivities of the total license termination cost to the disposal costs at different low-level radioactive waste disposal sites, to different depths of contaminated concrete surface removal within the facilities, and to different transport distances are also examined.

23631 (NUREG/CR–6174-Vol.2) **Revised analyses of decommissioning for the reference boiling water reactor power station. Effects of current regulatory and other considerations on the financial assurance requirements of the decommissioning rule and on estimates of occupational radiation exposure: Appendices, draft report for comment. 23632 (NUREG/CR–6263-Vol.1) **High integrity software for nuclear power plants: Candidate guidelines, technical basis and research needs. Executive summary: Volume 1.** Seth, S. (Mitre Corp., McLean, VA (United States)); Bail, W.; Cleaves, D.; Cohen, H.; Hybertson, D.; Schaefer, C.; Stark, G.; Ta, A.; Ulery, B. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Technology; Mitre Corp., McLean, VA (United States). Jun 1995. 78p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). (MTR–94W0000114-Vol.1). Source: OSTI; NTIS; INIS; GPO.

The work documented in this report was performed in support of the US Nuclear Regulatory Commission to examine the technical basis for candidate guidelines that could be considered in reviewing and evaluating high integrity computer software used in the safety systems of nuclear power plants. The framework for the work consisted of the following software development and assurance activities: requirements specification; design; coding; verification and validation, including static analysis and dynamic testing; safety analysis; operation and maintenance; configuration management; quality assurance; and planning and management. Each activity (framework element) was subdivided into technical areas (framework subelements). The report describes the development of approximately 200 candidate guidelines that span the entire range of software life-cycle activities; the assessment of the technical basis for those candidate guidelines; and the identification, categorization and prioritization of research needs for improving the technical basis. The report has two volumes: Volume 1, Executive Summary, includes an overview of the framework and of each framework element, the complete set of candidate guidelines, the results of the assessment of the technical basis for each candidate guideline, and a discussion of research needs that support the regulatory function; Volume 2 is the main report.

23633 (NUREG/CR–6270) **Estimating boiling water reactor decommissioning costs. A user's manual for the BWR Cost Estimating Computer Program (CECP) software: Draft report for comment.** Bierschbach, M.C. (Pacific Northwest Lab., Richland, WA (United States)). Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications. Dec 1994. 178p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC06-76RL01830. (PNL–10086). Source: OSTI; NTIS; GPO; INIS.

With the issuance of the Decommissioning Rule (July 27, 1988), nuclear power plant licensees are required to submit to the U.S. Regulatory Commission (NRC) for review, decommissioning plans and cost estimates. This user's manual and the accompanying Cost Estimating Computer Program (CECP) software provide a cost-calculating methodology to the NRC staff that will assist them in assessing the adequacy of the licensee submittals. The CECP, designed to be used on a personal computer, provides estimates for the cost of decommissioning BWR power stations to the point of license termination. Such cost estimates include component, piping, and equipment removal costs; packaging costs; decontamination costs; transportation costs; burial costs; and manpower costs. In addition to costs, the CECP also calculates burial volumes, person-hours, crew-hours, and exposure person-hours associated with decommissioning.

23634 (SAND–95-1035C) **CONTAIN code analyses of direct containment heating (DCH) experiments.** Williams, D.C.; Griffith, R.O.; Tadios, E.L.; Washington, K.E. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951006–2: Winter meeting of the American Nuclear Society, San Francisco, CA (United States), 29 Oct - 1 nov 1995). Order Number DE95013029. Source: OSTI; NTIS; INIS; GPO Dep.

In some nuclear reactor core melt accidents, a potential exists for molten core debris to be dispersed into the containment under high pressure. Resulting energy transfer to the containment atmosphere can pressurize the containment. This process, known as direct containment heating (DCH), has been the subject of extensive experimental and analytical programs sponsored by the US Nuclear Regulatory Commission (NRC). DCH modeling has been a major focus for the development of the CONTAIN code. In support of the peer review, extensive analyses of DCH experiments were

performed in order to assess the CONTAIN code's DCH models and improve understanding of DCH phenomenology. The present paper summarizes this assessment effort.

23635 (SAND–95-1036C) **CONTAIN code analyses of direct containment heating (DCH) experiments: Model assessment and phenomenological interpretation.** Williams, D.C.; Griffith, R.O.; Tadios, E.L.; Washington, K.E. Sandia National Labs., Albuquerque, NM (United States). 12 May 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951006–1: Winter meeting of the American Nuclear Society, San Francisco, CA (United States), 29 Oct - 1 nov 1995). Order Number DE95013028. Source: OSTI; NTIS; INIS; GPO Dep.

Models for direct containment heating (DCH) in the CONTAIN code for severe accident analysis have been reviewed and a standard input prescription for their use has been defined. The code has been exercised against a large subset of the available DCH data base. Generally good agreement with the experimental results for containment pressurization (ΔP) and hydrogen generation has been obtained. Extensive sensitivity studies have been performed which permit assessment of many of the strengths and weaknesses of specific model features. These include models for debris transport and trapping, DCH heat transfer and chemistry, atmosphere-structure heat transfer, interactions between nonairborne debris and blowdown steam, potential effects of debris-water interactions, and hydrogen combustion under DCH conditions. Containment compartmentalization is an important DCH mitigator in the calculations, in agreement with experimental results. The CONTAIN model includes partially parametric treatments for some processes that are not well understood. The importance of the associated uncertainties depends upon the details of the DCH scenario being analyzed. Recommended sensitivity studies are summarized that allow the user to obtain a reasonable estimate of the uncertainties in the calculated results.

23636 (SAND–95-1361) **Aging assessment for active fire protection systems.** Ross, S.B. (Science and Engineering Associates, Inc. (United States)); Nowlen, S.P.; Tanaka, T. Sandia National Labs., Albuquerque, NM (United States). Jun 1995. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95015733. Source: OSTI; NTIS; INIS; GPO Dep.

This study assessed the impact of aging on the performance and reliability of active fire protection systems including both fixed fire suppression and fixed fire detection systems. The experience base shows that most nuclear power plants have an aggressive maintenance and testing program and are finding degraded fire protection system components before a failure occurs. Also, from the data reviewed it is clear that the risk impact of fire protection system aging is low. However, it is assumed that a more aggressive maintenance and testing program involving preventive diagnostics may reduce the risk impact even further.

23637 (DOE/PO/10221–T1) **Summary report on the project to develop recommendations on effective linkages between state IRP, facility siting and regional transmission planning in a competitive environment. Final report, May 24, 1994–March 31, 1995.** Western Interstate Energy Board, Denver, CO (United States). [1995]. 74p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-94PO10221. Order Number DE95015456. Source: OSTI; NTIS; GPO Dep.

This project, which began on May 1, 1994, was designed to: improve the understanding of the types of linkages (or lack of linkages) between utility-specific IRP, state facility siting, and regional transmission planning given (1) the current level of competition, (2) increased generation competition, and (3) retail competition; identify opportunities to better coordinate utility-specific IRP and state facility siting with regional transmission planning, including better regional market and transmission planning information for utility-specific plans; and improve the understanding of the influence of competition on utility-specific IRP in terms of planning objectives, planning process, plan implementation and plan output, and identify potential changes to utility-specific IRP to allow IRP to meet planning objectives in a competitive environment.

23638 (ETDE-BR–0002) **An expert system for the identification and quantification of energy interchange modalities.** Albuquerque Junior, Leonel Araujo. Pontificia Univ. Catolica do Rio de Janeiro, RJ (Brazil). Dept. de Informatica. Dec 1988. 141p. (In Portugese). Order Number DE95789946. Source: OSTI; NTIS (US Sales Only).

Many problems related to the energetic operation planning of electric power systems are difficult to solve computationally because they need complex or still unavailable mathematical models or they deal with methodologies that changes frequently. In this document, we try to study one of these problems by the highly experienced professional point of view and to use the expert system technique to develop an efficient tool to solve it. We study the energy interchanges modalities identification and quantification problem of the brazilian electric power system and we describe the expert system developed. (author), 32 refs, 12 tabs

23639 (CONF-9410335–, pp. 230-245) **An architecture for an intelligent automatic generation control for electric power systems.** King, R.L. (Mississippi State Univ., MS (United States)); Luck, R. USDOE Pittsburgh Energy Technology Center, PA (United States); Oregon State Univ., Corvallis, OR (United States). Dept. of Computer Science; Naval Research Lab., Washington, DC (United States); Electric Power Research Inst., Palo Alto, CA (United States); Bureau of Mines, Washington, DC (United States). [1994]. From Adaptive control systems technology symposium; Pittsburgh, PA (United States); 24-25 Oct 1994. In *High-tech controls for energy and environment. Proceedings.* 287p. Order Number DE95011702. Source: OSTI; NTIS; GPO Dep.

The objective of Automatic Generation Control (AGC) is to dispatch electric power generation to met the load, while constrained by optimum economic operating conditions and the North American Electric Reliability Council (NERC) guidelines. NERC was formed to coordinate the operating practices of the interconnected utilities in North America. The research reported on in this paper defines an architecture for an intelligent AGC that will result in significant cost reductions (short term and long term costs) and improved system efficiency. Significant savings will be realized by improvements in base loading (i.e., less units on automatic generation control), less time operating the system uneconomically (i.e., for a variety of control reasons units are not always operating at their most economical point), and savings in operating and maintenance (O&M) costs (i.e., if more units are based loaded it is anticipated that plant operation will be more efficient). Specifically, this paper addresses issues surrounding the implementation of AGC on a large power system and suggests modifications to this implementation in which intelligent control could have a positive effect. The paper reports on research being conducted to use hybrid systems to monitor the status of a power plant, utilizing intelligent controllers for implementing AGC and dispatching power plants, very short term load forecasting (several minutes look ahead), and developing models of power plants to study degradation of plant performance as an input to AGC.

Source: OSTI; NTIS; GPO Dep.

In this study, a probe is positioned in the mixing zone of two air streams. The goal is to maintain the probe at the location of minimum temperature variation. A neural network was trained to predict this position based on air stream temperatures and flow rates. An expert system calls the network and positions the probe. The position that the neural network predicts is a quantity difficult to measure on-line. Without the information from the neural network, the expert system can not position the probe. With the information, the expert system maintains it at the desired location. This study demonstrates how artificial intelligence could be used to enhance a process control system so that a process functions at a more optimal performance.

23641 (ETDE-BR–0014) **Long range planning in electric power distribution systems.** Silva, Marcos Carneiro da. Universidade Estadual de Campinas, SP (Brazil). Faculdade de Engenharia Eletrica. Aug 1990. 202p. (In Portugese). Order Number DE95789958. Source: OSTI; NTIS (US Sales Only).

A new methodological approach for Electric Energy Distribution Systems Expansion Planning is presented. The problems related to primary and secondary networks are treated in a hierarchical model. In the primary system the aspects of location and sizing of substations as well as feeders routing are considered simultaneously. The model includes fixed costs of new substation and feeders and their expansions. The variable costs of losses receive a quadratic approach. An efficient Branch and Bound algorithm is used in problem solving. Network radiality is obtained through heuristic methods, which work under real cost function. On the secondary network, a heuristic procedure was developed which sequentially enumerates transformers and for each one of these configurations it studies in an optimized manner the transformers location, the secondary feeders routing and primary feeders and transformers interconnection. These three phases were modeled respectively as p-medians, quadratic facilities location problem and Steiner's problem. 53 refs, 34 figs, 20 tabs

23642 (ETDE-BR–0024) **Dynamic preventive control in electric power systems.** Minussi, Carlos Roberto. Santa Catarina Univ., Florianopolis, SC (Brazil). Programa de Pos-graduacao em Engenharia Eletrica. Nov 1990. 180p. (In Portugese). Order Number DE95789968. Source: OSTI; NTIS (US Sales Only).

This work presents a methodology for Preventive Control in Electric Power Systems, considering the transient stability and three-phases fault. The transient stability assessment is performed by the PEBS (Power Energy Boundary Surface) method, because this method presents many advantages such as: structure-preserving dynamic model, reduced calculation time and accuracy comparable to numerical simulations. The preventive control method is developed by sensitivity analysis, using the security margin concept. In this way, an incremental model between the security margin change and the pre-fault angular position of the synchronous machines relative to inertial center is determined. The use of this model allows the development of several control alternatives, e.g., by generation re scheduling, load shedding, system topological change, etc, being necessary only to use appropriate transformations. In this work we define a procedure to estimate the generation re scheduling such that the transient stability effect is minimized to levels considered secure. The generation re scheduling is determined by minimizing the change of the generation nominal state. The application results of the proposed method are presented considering two test systems, composed of 10 and 20 synchronous machines based on the southern Brazil system configuration and the IEEE 118 bus system. 51 refs, 22 tabs, 11 figs

23643 (ETDE-BR–0025) **Long term planning for expansion of electric energy transmission systems with restriction of transient stability using the concept of potential energy boundary surface.** Mano, Aldo Mario. Santa Catarina Univ., Florianopolis, SC (Brazil). Programa de Pos-graduacao em Engenharia Eletrica. Jun 1988. 128p. (In Portugese). Order Number DE95789969. Source: OSTI; NTIS (US Sales Only).

This work is concerned with long term planning of electric energy transmission networks. It makes use of graph-searching technique to obtain an alternative and an expansion program, considering the evaluation of the transient stability in the security analysis. A long term planning searches to analyse the transmission system alternatives, to assure the supply market requirements, in a horizon up to 20 years. The transient stability analysis is used in the security evaluation using the PEBS where the contingencies considered are transmission line or transformers outages and short circuits eliminated through transmission line disconnection. More realistic results are obtained with this criterion. For the expansion problem solution, a search algorithm with heuristics is used, where suboptimal or optimal solutions can be found in a specific time. The method is applied to three test systems and results are compared with techniques that use another security evaluation methods. 30 refs, 26 tabs, 9 figs

23644 (CONF-941089–Vol.1, pp. 271-283) **Overview of U.S. electric utilities: Transmission and distribution systems.** Brown, R.D. (East Kentucky Power Cooperative, Inc., Winchester, KY (United States)). USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 1.* 459p. Order Number DE95011612. Source: OSTI; NTIS; INIS; GPO Dep.

I hope this brief description of the US electric utility industry has been interesting and informative. No doubt many characteristics, concerns, and research efforts mirror those of the electric utility industry in South Korea. It is hoped that through workshops such as this that electric utilities, manufacturers and consultants may learn from each other for the mutual benefit of all.

23645 (CONF-941089–Vol.1, pp. 285-291) **Present status and forecast of T&D facilities.** Ko, In-Suk. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. Before the end of the 1970s, because of our marvelous economic growth and industrial development we had made our best efforts to develop more power sources. But from the 1980s, KEPCO has invested for T&D facility of high quality and improved system reliability. The main considerations for T&D expansion are positive investment to improve facilities of the electric company, improvement of the quality of electrical equipment during manufacturing, and bettering the field construction of power facilities. In order to achieve the ultimate goal of supplying high quality electricity, we will try to improve cooperation between our domestic industries, and research institutes, and increase the exchange of international technology.

23646 (CONF-941089–Vol.1, pp. 293-311) **Intelligent devices simplify remote SCADA installations in substations.** Kopriva, V.J. (Gilbert/Commonwealth, Inc., Reading, PA (United States)). USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 1.* 459p. Order Number DE95011612. Source: OSTI; NTIS; INIS; GPO Dep.

Utilities are increasingly relying on Supervisory Control and Data Acquisition (SCADA) Systems for the effective and economical management of electric transmission and distribution systems. Now, advances in equipment and design technologies have created opportunities for an increased level of monitoring and control at electric power substations. In the past, prohibitive factors, including complicated equipment and wiring retrofits, protocol compatibility, and hardware installation and maintenance costs have impeded electric utilities in their attempt at broad based application of SCADA systems in electric substations, particularly at distribution voltage levels. These advances in equipment technologies

have provided utilities with the opportunity to install and operate SCADA systems at lower cost, while providing flexibility for system expansion over longer periods. The development of intelligent microprocessor controlled devices and integrated communications has facilitated the use of a distributed design approach to installing SCADA monitoring and control in substations. This approach offers greater hardware flexibility and reduced installation costs while increasing reliability, making the addition of monitoring and control to electric substations increasingly practical. This paper will examine current trends in the application of intelligent microprocessor controlled and electronic devices, in stand alone and distributed applications, and the simplification of techniques for installing SCADA systems in substations. It will also consider the potential advantages to be realized in cost and reliability, and examine the necessary changes in design and operation philosophies required to effectively implement the new technology.

23647 (CONF-941089–Vol.1, pp. 313-314) **Fisher Pierce products for improving distribution system reliability.** USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 1.* 459p. Order Number DE95011612. Source: OSTI; NTIS; INIS; GPO Dep.

The challenges facing the electric power utility today in the 1990s has changed significantly from those of even 10 years ago. The proliferation of automation and the personnel computer have heightened the requirements and demands put on the electric distribution system. Today's customers, fighting to compete in a world market, demand quality, uninterrupted power service. Privatization and the concept of unregulated competition require utilities to streamline to minimize system support costs and optimize power delivery efficiency. Fisher Pierce, serving the electric utility industry for over 50 years, offers a line of products to assist utilities in meeting these challenges. The Fisher Pierce Family of products provide tools for the electric utility to exceed customer service demands. A full line of fault indicating devices are offered to expedite system power restoration both locally and in conjunction with SCADA systems. Fisher Pierce is the largest supplier of roadway lighting controls, manufacturing on a 6 million dollar automated line assuring the highest quality in the world. The distribution system capacitor control line offers intelligent local or radio linked switching control to maintain system voltage and Var levels for quality and cost efficient power delivery under varying customer loads. Additional products, designed to authenticate revenue metering calibration and verify on sight metering service wiring, help optimize the profitability of the utility assuring continuous system service improvements for their customers.

23648 (CONF-941089–Vol.1, pp. 315-333) **A microprocessor-based digital feeder monitor with high-impedance fault detection.** Patterson, R. (GE Protection and Control, Malvern, PA (United States)); Tyska, W.; Russell, B.D. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 1.* 459p. Order Number DE95011612. Source: OSTI; NTIS; INIS; GPO Dep.

The high impedance fault detection technology developed at Texas A&M University after more than a decade of research, funded in large part by the Electric Power Research Institute, has been incorporated into a comprehensive monitoring device for overhead distribution feeders. This digital feeder monitor (DFM) uses a high waveform sampling rate for the ac current and voltage inputs in conjunction with a high-performance reduced instruction set (RISC) microprocessor to obtain the frequency response required for arcing fault detection and power quality measurements. Expert system techniques are employed to assure security while maintaining dependability. The DFM is intended to be applied at a distribution substation to monitor one feeder. The DFM is packaged in a non-drawout case which fits the panel cutout for a GE IAC overcurrent relay to facilitate retrofits at the majority of sites were electromechanical overcurrent relays already exist.

23649 (CONF-941089–Vol.1, pp. 335-371) **World-wide distribution automation systems.** Devaney, T.M. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 1.* 459p. Order Number DE95011612. Source: OSTI; NTIS; INIS; GPO Dep.

A worldwide power distribution automation system is outlined. Distribution automation is defined and the status of utility automation is discussed. Other topics discussed include a distribution management system, substation feeder, and customer functions, potential benefits, automation costs, planning and engineering considerations, automation trends, databases, system operation, computer modeling of system, and distribution management systems.

23650 (CONF-941089–Vol.1, pp. 373-400) **Amorphous metal distribution transformers: The energy-efficient alternative.** Garrity, T.F. (GE Power Systems, Schenectady, NY (United States)). USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 1.* 459p. Order Number DE95011612. Source: OSTI; NTIS; INIS; GPO Dep.

Amorphous metal distribution transformers have been commercially available for the past 13 years. During that time, they have realized the promise of exceptionally high core efficiency as compared to silicon steel transformer cores. Utility planners today must consider all options available to meet the requirements of load growth. While additional generation capacity will be added, many demand-side initiatives are being undertaken as complementary programs to generation expansion. The efficiency improvement provided by amorphous metal distribution transformers deserves to be among the demand-side options. The key to understanding the positive impact of amorphous metal transformer efficiency is to consider the aggregate contribution those transformers can make towards demand reduction. It is estimated that distribution transformer core losses comprise at least 1% of the utility's peak demand. Because core losses are continuous, any significant reduction in their magnitude is of great significance to the planner. This paper describes the system-wide economic contributions amorphous metal distribution transformers can make to a utility and suggests evaluation techniques that can be used. As a conservation tool, the amorphous metal transformer contributes to reduced power plant emissions. Calibration of those emissions reductions is also discussed in the paper.

23651 (CONF-941089–Vol.1, pp. 401-423) **Distributed generation systems model.** Barklund, C.R. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 1.* 459p. Order Number DE95011612. Source: OSTI; NTIS; INIS; GPO Dep.

A slide presentation is given on a distributed generation systems model developed at the Idaho National Engineering Laboratory, and its application to a situation within the Idaho Power Company's service territory. The objectives of the work were to develop a screening model for distributed generation alternatives, to develop a better understanding of distributed generation as a utility resource, and to further INEL's understanding of utility concerns in implementing technological change.

23652 (CONF-941089–Vol.1, pp. 425-439) **Current trends in the application of non-ceramic insulators for transmission & distribution lines subject to contamination.** Riordan, K.C. (Reliable Power Products, Franklin Park, IL (United States)). USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 1.* 459p. Order Number DE95011612. Source: OSTI; NTIS; INIS; GPO Dep.

Non-Ceramic Insulators (NCI) have been in application for more than 25 years. During this time, manufacturers have worked diligently to improve product designs and polymer materials. Today, the use of Non-Ceramic Polymer insulators is proliferating as Utilities become more confident in this advanced technology. The application advantages of NCI technology are more widely recognized and understood and credibility is growing in the long term service performance of these insulators. Current estimates place the NCI market share as high as 50% of the total US transmission insulator market. Indeed, Reliable Power Products is proud to advise that their insulators have been selected for the first 500 KV-DC transmission line in the USA to use 100% composite polymer insulators. With the combination of Los Angeles Department of Water and Power (Los Angeles to Las Vegas) and Salt River Project (Las Vegas to Phoenix), a total of almost 1,000 Kms. of transmission line will be insulated with Silicone Rubber Polymer Insulators. The total project will include almost 15,000 insulator strings. User confidence is not confined to the USA market. The application of NCI's by International Utilities has also experienced significant growth. This may be evidenced by EHV installations in South America, Middle East, South Africa, Australia and South East Asia.

23653 (CONF-941089–Vol.1, pp. 441-464) **Energy conservation in electric distribution.** Lee, Chong-Jin. USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 1.* 459p. Order Number DE95011612. Source: OSTI; NTIS; INIS; GPO Dep.

This paper discusses the potential for energy and power savings that exist in electric power delivery systems. These savings translate into significant financial and environmental benefits for electricity producers and consumers as well as for society in general. AlliedSignal's knowledge and perspectives on this topic are the result of discussions with hundreds of utility executives, government officials and other industry experts over the past decade in conjunction with marketing our Amorphous Metal technology for electric distribution transformers. Amorphous metal is a technology developed by AlliedSignal that significantly reduces the energy lost in electric distribution transformers at an incremental cost of just a few cents per kilo-Watt-hour. The purpose of this paper is to discuss: Amorphous Metal Alloy Technology; Energy Savings Opportunity; The Industrial Barriers and Remedies; Worldwide Demand; and A Low Risk Strategy. I wish this presentation will help KEPCO achieve their stated aims of ensuring sound development of the national economy and enhancement of public life through the economic and stable supply of electric power. AlliedSignal Korea Ltd. in conjunction with AlliedSignal Amorphous Metals in the U.S. are here to work with KEPCO, transformer manufacturers, industry, and government agencies to achieve greater efficiency in power distribution.

23654 (DOE/AL/82993–9) **The value of distributed generation: The PVUSA grid-support project serving Kerman Substation. Interim report, April 1994.** Hoff, T. (Pacific Energy Group (United States)); Wenger, H. Pacific Gas and Electric Co., San Ramon, CA (United States). Dept. of Research and Development; Pacific Energy Group (United States). Jul 1994. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC04-92AL82993. Order Number DE95013803. Source: OSTI; NTIS; GPO Dep.

A common practice of electric utilities experiencing transmission and distribution (T and D) system overloads is to expand the substation, add lines, or upgrade equipment, all of which are capital intensive options. In 1988, it was hypothesized that strategically sited photovoltaics (PV) could benefit parts of T and D systems near or at overloaded conditions. An evaluation methodology was developed and applied to a test case (Kerman Substation near Fresno, California). Analytical results suggested that the value of PV to the T and D system could substantially exceed its energy and generation capacity value. The importance of this finding indicated the need for empirical validation. This led to the construction of a 0.5 MW PV demonstration plant by Pacific Gas and Electric Company (PG and E) at Kerman, California as part of the PVUSA (PV for Utility Scale Applications) project. PVUSA is a national public-private partnership that is assessing and demonstrating the viability of utility-scale photovoltaic electric generation systems. The Kerman PV plant, commissioned for commercial operation in June, 1993, is reported to be the first grid-support PV demonstration plant in the world. This Interim Report focuses on validating the technical aspects of grid-support PV. It provides interim validation results for four of the eight identified value components that stack up to make the "value bar", and compares them to 1992 Case Study estimates. Results are based on improved technical evaluation methodologies, measured plant performance under a variety of conditions, and long-term plant performance estimated using a validated computer simulation program. This report is not intended to be exhaustive in scope. It does, however, provide a thorough progress update of the validation project. Complete documentation of test procedures, data, and evaluation methods will be presented in the Final Report.

23655 (DOE/OR/21999–T2) **Refurbish power supply/distribution system Phase II. Progress status report No. 43, March 1, 1995–March 31, 1995.** Hayes, Seay, Mattern and Mattern, Roanoke, VA (United States). 31 Mar 1995. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-91OR21999. Order Number DE95014990. Source: OSTI; NTIS; GPO Dep.

This is a progress report detailing the schedules, accomplishments, and contract changes in the refurbishment of the Oak Ridge Y-12 plant power supply and distribution system.

23656 (ETDE-BR–0022) **Hierarchical state estimation for interconnected electric power systems: a comparative analysis.** Silva Gouvea, Jose Paulo da. Santa Catarina Univ., Florianopolis, SC (Brazil). Programa de Pos-graduacao em Engenharia Eletrica. Aug 1990. 151p. (In Portugese). Order Number DE95789966. Source: OSTI; NTIS (US Sales Only).

This work is a comparative study of three hierarchical state estimation algorithms for interconnected electric power systems. The algorithms related were proposed in the literature and consider the electric system made up of various subsystems coordinated by an Energy Control Center. All three algorithms work with two hierarchical levels. The first is the local level and is related to the state estimation of the individual subsystems. The second is the coordination level, and is related to the estimation of the phase angles among the slack busses of the individual subsystems. The objective of this work is to determine the characteristics of each algorithm, assessing its applicability to the state estimation of interconnected power systems. Aspects such as information interchanges among the subsystems and the coordination level and vice-verse, storage requirements, execution time, accuracy, reliability and bad data processing are also analyzed. Comparisons are made between the results obtained by hierarchical estimators against the results obtained by a classical integrated estimator. The performance of each algorithm is tested using two electric power systems. The first test system is the IEEE-30 bus network. The second one is a realistic system derived from the 230 kV/500 kV interconnected network of the south-southeast region of Brazil. (author). 28 refs, 9 figs, 31 tabs

23657 (ORNL–6804/R1) **The feasibility of replacing or upgrading utility distribution transformers during routine maintenance.** Barnes, P.R.; Van Dyke, J.W.; McConnell, B.W.; Cohn, S.M.; Purucker, S.L. Oak Ridge National Lab., TN (United States). Apr 1995. 105p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95013967. Source: OSTI; NTIS; GPO Dep.

It is estimated that electric utilities use about 40 million distribution transformers in supplying electricity to customers in the United States. Although utility distribution transformers collectively have a high average efficiency, they account for approximately 61 billion kWh of the 229 billion kWh of energy lost annually in the delivery of electricity. Distribution transformers are being replaced over time by new, more efficient, lower-loss units during routine utility maintenance of power distribution systems. Maintenance is typically not performed on units in service. However, units removed from service with appreciable remaining life are often refurbished and returned to stock. Distribution transformers may be removed from

service for many reasons, including failure, over- or underloading, or line upgrades such as voltage changes or rerouting. When distribution transformers are removed from service, a decision must be made whether to dispose of the transformer and purchase a lower-loss replacement or to refurbish the transformer and return it to stock for future use. This report contains findings and recommendations on replacing utility distribution transformers during routine maintenance, which is required by section 124(c) of the Energy Policy Act of 1992. The objectives of the study are to evaluate the practicability, cost-effectiveness, and potential energy savings of replacing or upgrading existing transformers during routine utility maintenance and to develop recommendations on was to achieve the potential energy savings.

23658 (PNL-SA–25889) **High-temperature superconducting transformer evaluation.** DeSteese, J.G.; Dagle, J.E.; Dirks, J.A. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950414–7: 57. annual American power conference, Chicago, IL (United States), 18-20 Apr 1995). Order Number DE95014192. Source: OSTI; NTIS; GPO Dep.

The advancing development of high-temperature superconducting (HTS) materials is encouraging the evaluation of many practical applications. This paper summarizes a study that examined the future potential of HTS power transformers in the 30-MVA to 1000-MVA capacity range. Transformer performance was characterized on the basis of potentially achievable HTS materials capabilities and dominant transformer design parameters. Life-cycle costs were estimated and compared with those of conventional transformers to evaluate the economic viability and market potential of HTS designs. HTS transformers are projected to have both capital and energy cost advantages attributable to their ability to be intrinsically smaller and lighter than conventional transformers of comparable capacity.

23659 (USGS-OFR–94-638) **Stability of submerged slopes on the flanks of the Hawaiian Islands, a simplified approach.** Lee, H.J.; Torresan, M.E.; McArthur, W. Geological Survey, Menlo Park, CA (United States). 1994. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI05-93OR22089. Order Number DE95013086. Source: OSTI; NTIS; GPO Dep.

Undersea transmission lines and shoreline AC-DC conversion stations and near-shore transmission lines are being considered as part of a system for transporting energy between the Hawaiian Islands. These facilities will need to be designed so that they will not be damaged or destroyed by coastal or undersea landslides. Advanced site surveys and engineering design of these facilities will require detailed site specific analyses, including sediment sampling and laboratory testing of samples, in situ testing of sediment and rock, detailed charting of bathymetry, and two- or three-dimensional numerical analyses of the factors of safety of the slopes against failure from the various possible loading mechanisms. An intermediate approximate approach can be followed that involves gravity and piston cores, laboratory testing and the application of simplified models to determine a seismic angle of repose for actual sediment in the vicinity of the planned facility. An even simpler and more approximate approach involves predictions of angles of repose using classification of the sediment along a proposed route as either a coarse volcaniclastic sand, a calcareous ooze, or a muddy terrigenous sediment. The steepest slope that such a sediment can maintain is the static angle of repose. Sediment may be found on slopes as steep as these, but it must be considered metastable and liable to fail in the event of any disturbance, storm or earthquake. The seismic angle of repose likely governs most slopes on the Hawaiian Ridge. This declivity corresponds to the response of the slope to a continuing seismic environment. As a long history of earthquakes affects the slopes, they gradually flatten to this level. Slopes that exceed or roughly equal this value can be considered at risk to fail during future earthquakes. Seismic and static angles of repose for three sediment types are tabulated in this report.

2403 Power Transmission Lines and Cables

23660 (CONF-941089–Vol.2, pp. 860-898) **Bulk power system performance issues affecting utility peaking capacity additions.** Garrity, T.F. (GE Power Sytems, Schenectady, NY (United States)). USDOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 2.* 607p. Order Number DE95011613. Source: OSTI; NTIS; GPO Dep.

This paper presents a discussion of transmission system constraints and problems that affect the siting and rating of peaking capacity additions. Techniques for addressing and modifying these concerns are presented. Particular attention is paid to techniques that have been successfully used by utilities to improve power transfer and system loadability, while avoiding the construction of additional transmission lines. Proven techniques for dealing with thermal, short-circuit level and stability issues are presented.

23662 (DOE/EIS–0173-FINAL) **BPA/Puget Power Northwest Washington Transmission Project. Final Environmental Impact Statement.** USDOE Bonneville Power Administration, Portland, OR (United States); Whatcom, County of, WA (United States). Aug 1995. 238p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95016113. Source: OSTI; NTIS; GPO Dep.

BPA and Puget Sound Power & Light propose to upgrade existing high-voltage transmission system in the Whatcom and Skagit counties between the towns Custer and Sedro Woolley, including some land in Bellingham. The upgrades are needed to increase the transmission capacity on a nearby US-Canada 500kV intertie by about 850 MW. A Draft EIS was issued Nov. 1993. A supplemental DEIS was issued April 1995. The EIS was finalized by showing changes on insert sheets and attaching them to the supplemental DEIS. These changes together with the Supplemental DEIS form the Final EIS. The EIS has identified impacts that would generally be classified as low to moderate and localized. Effects on soils and water resources in sensitive areas (e.g., near Lake Whatcom) would be low to moderate; there would be either increases, decreases or no change in magnetic fields, depending on design and location; noise levels would remain at existing levels; and land use and property value impacts would be either short term or low. Threatened and endangered species would not be adversely affected. Visual impacts would be low to moderate; socioeconomic and cultural impacts would be low to moderate. The proposed action would allow BPA to use its part of the transmission capability increase to displace other generating resources in USA, when stored energy is returned from Canada.

25 ENERGY STORAGE

23664 (SAND–95-8247) **The emerging roles of energy storage in a competitive power market: Summary of a DOE Workshop.** Gordon, S.P.; Falcone, P.K. (eds.). Sandia National Labs., Albuquerque, NM (United States). Jun 1995. 78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941274–Summ.: Emerging roles of energy storage in a competitive power market, Pleasanton, CA (United States), 6-7 Dec 1994). Order Number DE95014489. Source: OSTI; NTIS; GPO Dep.

This report contains a summary of the workshop, "The Emerging Roles of Energy Storage in a Competitive Power Market," which was sponsored by the U.S. Department of Energy and Sandia National Laboratories and was held in Pleasanton, California on December 6-7, 1994. More than 70 people attended, representing government agencies, national laboratories, equipment vendors, electric utilities and other energy providers, venture capital interests, and consultants. Many types of energy storage were discussed, including electrical (batteries and superconducting magnets), mechanical (flywheels and pumped hydro), hydrogen, compressed air, and thermal energy storage. The objectives of the workshop were to communicate within the energy storage community regarding the costs, benefits, and technical status of various technology options; to explore and elucidate the evolving roles of energy storage in a more dynamic and competitive power and energy marketplace; and to discuss the optimum federal role in this area. The goals of the workshop were fully realized through knowledgeable and insightful presentations and vigorous discussion, which are summarized.

23665 (ANL/ET/CP–84772) **High-temperature superconductor current leads for electric utility SMES applications.** Niemann, R.C. (Argonne National Lab., IL (United States)); Cha, Y.S.; Hull, J.R.; Buckles, W.E.; Weber, B.R.; Dixon, K.D.; Rey, C.M. Argonne National Lab., IL (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950729–9: 30. Intersociety energy conversion conference, Orlando, FL (United States), 30 Jul - 5 aug 1995). Order Number DE95014223. Source: OSTI; NTIS; GPO Dep.

Current leads that utilize high-temperature superconductors (HTSS) to deliver power to devices operating at liquid helium temperature have the potential to reduce refrigeration requirements to levels significantly below those achievable with conventional leads. As part of the US Department of Energy's Superconductivity Technology Program, Argonne National Laboratory and two industrial partners are developing HTS current leads for application to superconducting magnetic energy storage (SMES) systems. Superconductivity, Inc. (SI) is a supplier of micro-SMES systems for power-quality applications. A typical SI SMES system has an 0.3-kWh energy capacity and operates at currents up to 1.2 k.A. The Babcock & Wilcox Company (B&W) is engaged in a project to design, build, and demonstrate a midsized SMES system. The B&W system has an 0.5-MWh energy capacity and operates at currents up to 16 kA. Details of the lead designs. including materials, configuration and performance predictions. are presented.

23666 (CRIE-T–93079) **Trend in research of lithium conductive solid electrolyte.** Kobayashi, A. (Central Research Institute of Electric Power Industry, Tokyo (Japan)); Takei, K.; Miyashiro, T.; Iwahori, T. Central Research Inst. of Electric Power Industry, Abiko, Chiba (Japan). Jun 1994. 40p. (In Japanese). Order Number DE95790573. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

In reference to a solid electrolyte for lithium secondary batteries, a survey was made on the trend in domestic and overseas researches, searching for electrolyte systems that seemed promising. Solid electrolytes are stable at a high temperature, easy for a compact lamination, and hopeful of the enhancement of energy density. A high polymer type solid electrolyte has the operating temperature of approximately 100°C and is unable to provide a satisfactory performance at room temperature. Moreover, its cation transference number is small, and an increase in resistance is feared at the time of charge/discharge of anion moving. An inorganic type has a high cation transference number and has a potential for the enhancement in conductivity through the control of the crystal structure and vitrified state. However, the inorganic type presents difficulty in making a large area and the lack of stability with lithium metal, leaving a number of problems for the practical use. A composite type is such that a high polymer network is provided with an inorganic conductive mechanism. It has a good potential in the enhancement in conductivity, capability of making a thin film and that of making a large area as well as having a high cation transference number, all of which contribute to the bright future in spite of a number of unknown points. 57 refs., 27 figs., 6 tabs.

23667 (DOE/ER/14379–T1) **Nickel-metal hydride battery development. Final technical report.** Electro Energy, Inc., Danbury, CT (United States). Jun 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-93ER14379. Order Number DE95015502. Source: OSTI; NTIS; GPO Dep.

Rechargeable batteries are used as the power source for a broad range of portable equipment. Key battery selection criteria typically are weight, volume, first cost, life cycle cost, and environmental impact. Rechargeable batteries are favored from a life cycle cost and environmental impact standpoint over primary batteries. The nickel-metal hydride (Ni-MH) battery system has emerged as the battery of choice for many applications based on its superior characteristics when judged on the above criteria against other battery types. In most cases commercial Ni-MH batteries are constructed with coiled electrodes in cylindrical metal containers. Electro Energy, Inc. (EEI) has been developing a novel flat bipolar configuration of the Ni-MH system that offers weight, volume, and cost advantages when compared to cylindrical cells. The unique bipolar approach consists of fabricating individual flat wafer cells in conductive, carbon-filled, plastic face plates. The individual cells contain a nonconductive plastic border which is heat sealed around the perimeter to make a totally sealed unit cell. Multi-cell batteries are fabricated by stacking the individual wafer cells in such a way that the positive face of one cell contacts the negative face of the

adjacent cell. The stack is then contained in an outer housing with end contacts. The purpose of this program was to develop, evaluate, and demonstrate the capabilities of the EEI Ni-MH battery system for consumer applications. The work was directed at the development and evaluation of the compact bipolar construction for its potential advantages of high power and energy density. Experimental investigations were performed on various nickel electrode types, hydride electrode formulations, and alternate separator materials. Studies were also directed at evaluating various oxygen recombination techniques for low pressure operation during charge and overcharge.

23668 (SAND–90-2318) **Deformation study of separator pellets for thermal batteries.** Guidotti, R.A.; Reinhardt, F.W.; Thomas, E.V. Sandia National Labs., Albuquerque, NM (United States). May 1995. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95013871. Source: OSTI; NTIS; GPO Dep.

The deformation characteristics of pellets of electrolyte-binder (EB) mixes based on MgO were measured under simulated, thermal-battery conditions. Measurements (using a statistically designed experimental strategy) were made as a function of applied pressure, temperature, and percentage of theoretical density for four molten-salt electrolytes at two levels of MgO. The EB mixes are used as separators in Li-alloy thermal batteries. The electrolytes included LiCl-KCl eutectic, LiCl-LiBr-KBr eutectic, LiBr-KBr-LiF eutectic, and a LiCl-LiBr-LiF electrolyte with a minimum-melting composition. The melting points ranged from 313 C to 436 C. The experimental data were used to develop statistical models that approximate the deformation behavior of pellets of the various EB mixes over the range of experimental conditions we examined. This report, discusses the importance of the deformation response surfaces to thermal-battery design.

23669 (SAND–95-1313C) **Thermal batteries: A technology review and future directions.** Guidotti, R.A. Sandia National Labs., Albuquerque, NM (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951033–3: 27. international technical conference of the Society for the Advancement of Material and Process Engineering: diversity into the next century, Albuquerque, NM (United States), 9-12 Oct 1995). Order Number DE95014859. Source: OSTI; NTIS; GPO Dep.

Thermally activated ("thermal") batteries have been used for ordnance applications (e.g., proximity fuzes) since World War II and, subsequent to that, in nuclear weapons. This technology was developed by the Germans as a power source for their V2 rockets. It was obtained by the Allies by interrogation of captured German scientists after the war. The technology developed rapidly from the initial primitive systems used by the Germans to one based on Ca/$CaCrO_4$. This system was used very successfully into the late 1970s, when it was replaced by the Li-alloy/FeS_2 electrochemical system. This paper describes the predominant electrochemical couples that have been used in thermal batteries over the years. Major emphasis is placed on the chemistry and electrochemistry of the Ca/$CaCrO_4$ and Li-alloy/FeS_2 systems. The reason for this is to give the reader a better appreciation for the advances in thermal-battery technology for which these two systems are directly responsible. Improvements to date in the current Li-alloy/FeS_2 and related systems are discussed and areas for possible future research and development involving anodes, cathodes, electrolytes, and insulations are outlined. New areas where thermal-battery technology has potential applications are also examined.

29 ENERGY PLANNING AND POLICY

2901 Energy Analysis and Modeling

23670 (ETDE-DE–137) **Climate-compatible energy supply in Baden-Wuerttemberg. Industry and small-scale consumers with high process energy consumption.** Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg. Arbeitsberichte, v. 9. Jochem, E. (Fraunhofer-Institut fuer Systemtechnik und Innovationsforschung (ISI), Karlsruhe (Germany)); Bradke, H.; Mannsbart, W.; Oetjen, H. Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg, Stuttgart (Germany). Apr 1994. 121p. (In German). Order Number DE95790279. Source: OSTI; NTIS (US Sales Only).

In the context of a "Technical Guide for Climate-Compatible Energy Supply" for Baden-Wuerttemberg, potential energy savings are to be investigated, including the investment cost and measures required for achieving energy savings in the different consumption sectors. This report analyzes the industrial sector and those sectors of small-scale consumers (agriculture/horticulture, trade, small-scale industries, building industry) where process energy consumption is high. The potentials of combined heat and power generation are discussed.

23671 (ETDE-DE–139) **Climate-compatible energy supply in Baden-Wuerttemberg. Demand scenario.** Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg. Arbeitsberichte, v. 6. Bonhoff, C. (Stuttgart Univ. (Germany). Inst. fuer Energiewirtschaft und Rationelle Energieanwendung (IER)); Fahe, U.; Voss, A. Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg, Stuttgart (Germany). Apr 1994. 80p. (In German). Order Number DE95790286. Source: OSTI; NTIS (US Sales Only).

This report comprises three parts: In the first part, the global background data for a projection of exogenic determinant factors relevant for the development of energy supply in BAden-Wuerttemberg are described. On this basis, the second part presents a finer structure of the background data, while the third part defines the indicators which determine energy consumption. Consumer groups and energy uses are differentiated.

23672 (ETDE-DE–140) **Climate-compatible energy supply in Baden-Wuerttemberg - Least-cost planning for the household and small-scale consumption sector in Baden-Wuerttemberg.** Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg. Arbeitsberichte, v. 23. Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg, Stuttgart (Germany); Fichtner, Beratende Ingenieure fuer Energie- und Waermewirtschaft GmbH und Co. KG, Stuttgart (Germany). Jun 1994. 88p. (In German). Order Number DE95790269. Source: OSTI; NTIS (US Sales Only).

The concept of least-cost planning and its theoretical background are explained. After this, the report investigates whether the LCP approach, which originated in the USA, can be applied in the legal and structural conditions of power supply in Baden-Wuerttemberg. LCP programmes and measures carried out in Baden-Wuerttemberg until now are analyzed, and the potential savings in electric power are estimated and discussed. Obstacles to the LCP strategy and problems connected with it are pointed out, and possible solutions are presented. Finally, conclusions are drawn and recommendations made.

23673 (BNL–61702) **Local alliance building for urban science education.** Brookhaven National Lab., Upton, NY (United States). Sep 1994. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9408239–Summ.: Local alliance building for urban science education (Lab for use), Upton, NY (United States), 7-9 Aug 1994). Order Number DE95013512. Source: OSTI; NTIS; GPO Dep.

Leaders from nationally recognized sponsors of teacher education partnerships, the US DOE, university leaders, the New York State Department of Education and past and present teacher researchers gathered at Brookhaven National Laboratory in August 1994. Their mission was (1) to consider the unique aspects that research experiences provide for teachers and their students and (2) to discuss the value of systemic changes to the teacher preparation process to include such experiences. Presentations by participants and small-group discussion sessions led to an action plan and recommendations for disseminating materials addressing these issues

nationally. Concluding remarks labeled the issues discussed as critical to the systemic change in the teacher preparation process. By sharing this document, additional interest and feedback will be generated, as will commitments to this philosophy.

23675 (CONF-9410353–Exc.) **Sharing our successes II: Changing the face of science and mathematics education through teacher-focused partnerships.** United States Export Council for Renewable Energy, Washington, DC (United States). [1995]. 100p. Sponsored by USDOE, Washington, DC (United States);National Aeronautics and Space Administration, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract FG02-94ER76002. From 2. sharing our successes conference on changing the face of science and mathematics education through teacher-focused partnerships; Berkeley, CA (United States); 12-14 Oct 1994. Order Number DE95014714. Source: OSTI; NTIS; GPO Dep.

Industry Initiatives for Science and Math Education (IISME) in the San Francisco Bay Area planned and convened the second national conference for representatives of scientific work experience programs for K-12 teachers (SWEPs) at Lawrence Hall of Science, University of California at Berkeley October 13-14, 1994. The goal of this conference was to further strengthen the growing community of SWEP managers and teacher participants by providing an opportunity for sharing expertise and strategies about the following: (1) How SWEPs can complement and stimulate systemic education reform efforts; (2) Assessment strategies piloted by the ambitious multi-site evaluation project funded by the U.S. Department of Energy (DOE) as well as smaller evaluation projects piloted by other SWEPs; (3) Expanding and strengthening the base of teachers served by SWEPs; (4) Ensuring that SWEPs adequately support teachers in affecting classroom transfer and offer "more than just a summerjob"; (5) Sustaining and expanding new programs. A special teacher strand focused on leadership development supporting teachers to become effective change agents in their classrooms and schools, and developing strong teacher communities.

23676 (CONF-9506115–2) **Incorporating environmental justice into environmental decision making.** Wolfe, A.K. (Oak Ridge National Lab., TN (United States)); Vogt, D.P.; Hwang, Ho-Ling. Oak Ridge National Lab., TN (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 20. National Association of Environmental Professionals annual conference and exposition: environmental challenges - the next twenty years; Washington, DC (United States); 10-13 Jun 1995. Order Number DE95013978. Source: OSTI; NTIS; GPO Dep.

Executive Order 12898, signed on February 11, 1994, broadly states that federal activities, programs, and policies should not produce disproportionately high and adverse impacts on minority and low-income populations. Moreover, the Order indicates that these populations should not be denied the benefits of, or excluded from participation in, these activities, programs, and policies. Because a presidential memorandum accompanying the order said that National Environmental Policy Act (NEPA) documents should begin to address environmental justice immediately, much attention has been paid to assessment-related issues. Also important, a topic that appears to have received relatively little attention, is how decision makers should be expected to use information about environmental justice in their decision making. This paper discusses issues surrounding the use of environmental justice information in the decision-making process by focusing on the following five main topics: (1) the importance, or weight, attached to environmental justice within larger decision-making contexts; (2) the potential tension between localized environmental justice issues and regional or national issues and needs; (3) the use of environmental justice information to develop (perhaps in concert with affected minority and low-income communities) appropriate mitigation strategies, or to establish conditions under which activities, programs, and policies may be accepted locally; (4) the general implications of shifting the distribution of broadly defined risks, costs, and benefits among different population groups; and (5) the implications of implementing environmental justice on an individual, ad hoc basis rather than within a larger environmental justice framework. This paper raises the issues and discusses the implications of alternative approaches to them.

23677 (CONF-9506115–6) **The plethora of publics and their participation in policy making: How can they properly participate?.** Carnes, S.A. Oak Ridge National Lab., TN (United States). [1995]. 19p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. From 20. National Association of Environmental Professionals annual conference and exposition: environmental challenges - the next twenty years; Washington, DC (United States); 10-13 Jun 1995. Order Number DE95013981. Source: OSTI; NTIS; GPO Dep.

This paper examines the theoretical bases of publics and stakeholder participation in decision making, with special attention to mixed issues, including federal government actions such as remedial action programs and hazardous facility sitings. Empowerment associated with participation is addressed, focusing on differences between power and authority.

23678 (CR-B–95-05) **Audit of the Federal Energy Regulatory Commission's Office of Chief Accountant.** USDOE Office of Inspector General, Washington, DC (United States). Capital Regional Audit Office. 7 Apr 1995. 18p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI.

The Federal Energy Regulatory Commission's (Commission) mission is to oversee America's natural gas and oil pipeline transportation, electric utility, and hydroelectric power industries to ensure that consumers receive adequate energy supplies at just and reasonable rates. To carry out this mission, the Commission issues regulations covering the accounting, reporting, and rate-making requirements of the regulated utility companies. The Commission's Office of Chief Accountant performs financial related audits at companies to ensure compliance with these regulations. The purpose of this audit was to evaluate the office of Chief Accountant's audit performance. Specifically, the objectives were to determine if the most appropriate audit approach was used and if a quality assurance process was in place to ensure reports were accurate and supported by the working papers.

23679 (CRIE-R–93006) **Estimation of district energy saving potential by introduction of district energy supply systems. 1. Development of district energy saving estimation model.** Sagai, S. (Central Research Institute of Electric Power Industry, Tokyo (Japan)). Central Research Inst. of Electric Power Industry, Tokyo (Japan). Mar 1994. 30p. (In Japanese). Order Number DE95790566. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

Researches were carried out on such matters as energy saving effects through the utilization of unused energy resources and as functions concerning the estimation of restrictive conditions for the piping length in district heat supply, on a model for a district energy saving analysis in the case of the introduction of various cogeneration systems. For the unused energy resources, the objects selected were thermoelectric power stations, transforming stations, sewage-treatment plants, sludge incineration facilities, and waste incineration plants. Their quantities per day were estimated in consideration of the operation pattern at each generating source. These energy resources were classified into those directly usable as hot water/steam and those used through heat pumps, on which models were made. For the estimation of the piping length for heat supply, data were collected on the number of buildings, floor areas and road length in each mesh; and a heat supply quantity per unit piping system was formulated as a model. In the energy saving estimation model, an hourly observation was made on the heat inside

the districts, demand pattern and co-generation for electric power, and the generation of unused heat resources; and a comparison was made with the conventional means. 11 refs., 8 figs., 8 tabs.

23680 (CRIE-R--93017) **Estimation of district energy saving potential by introduction of district energy supply systems. 2. Estimation of district energy saving in the Tokyo area.** Sagai, S. (Central Research Institute of Electric Power Industry, Tokyo (Japan)). Central Research Inst. of Electric Power Industry, Tokyo (Japan). Mar 1994. 29p. (In Japanese). Order Number DE95790564. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

An analysis was made on energy saving by a co-generation arrangement model by using the data of energy demand pattern and the data of urban structure for the area of 23 wards in Tokyo. Energy demand data was inputted in the model for each of about 600 district meshes, and a hypothetical energy supply system was set up in each district mesh so as to fill the demand. Conventional energy supplies as electric power for commercial use and heat source for exclusive use were employed to compare with the energy supply efficiency. Four kinds of co-generation system and three operational patterns were prepared for the model, and the maximum energy saving ratio was automatically selected for each mesh. As the result of the analysis, demand for electricity was high as compared with heat, in the area where demand for energy was high in the central area of Tokyo. It was therefore considered advantageous to select a co-generation having a high generating efficiency. The average energy saving ratio of the entire Tokyo area was turned out approximately 20% by means of co-generation that was fit for the demand characteristic of each district mesh. 11 refs., 17 figs., 5 tabs.

23681 (CRIE-Y--94006) **Demographic forecasting modelling and prediction of Japanese population.** Kato, H. (Central Research Institute of Electric Power Industry, Tokyo (Japan)). Central Research Inst. of Electric Power Industry, Tokyo (Japan). Oct 1994. 38p. (In Japanese). Order Number DE95790544. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

In order to forecast a medium and long-range socio-economic environment, it is essential to precisely grasp the aging of population and the falling trend of fertility rate. For this purpose, a demographic forecasting model was developed which put emphasis on socio-economic aspects, and an estimation was made on the future Japanese population. The fall in the total fertility rate (TFR) has been largely influenced by a declining trend of fertility rate in the cohort of people aged 25 to 29 years. The continuation of such trend would contribute to the fall of TFR to 1.42 in 2010 and as low as 1.38 in 2020. The average span of life will extend to 78.9 years for males and to 85.9 years for females in 2020. As a result, the population will reach a peak of 127,020,000 in 2006 and then decline. It will move to 121,338,000 in 2020; and earlier in 2019, it will be lower than the level of 1990. The number of births will increase slightly from now because the second baby-boom generations reach childbearing age; but it will decrease again after 2001 and will fall below one million in 2015. The future population of people aged 65 years and over will increase from 12.1% in 1990 to 20.5% in 2015, and will reach 26.6% in 2020. 12 refs., 10 figs., 10 tabs.

23682 (DOE/OR/00033--T655) **Manpower assessment brief: June 1995, No. 29.** Oak Ridge Inst. for Science and Education, TN (United States). 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-76OR00033. Order Number DE95015626. Source: OSTI; NTIS; GPO Dep.

This document provides in verbal and graphical form projection of employment of scientists and engineers within the US Department of Energy for 1994-2000.

23683 (PNL-SA--26327) **Why so few young women in mathematics, science, and technology classes?** Wieda, K.J. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9506214--1: Women in technology conference, Woodbury, NY (United States), 17-18 Jun 1995). Order Number DE95014630. Source: OSTI; NTIS; GPO Dep.

Many factors influence the success of women in scientific and technical careers. Women represent over 50% of the U.S. population, yet less than 16% of women are employed in scientific and technical careers. Research over the last decade makes it clear that disparities exist in the participation, achievement, and attitudes of young men and young women in science classes. Young women are as interested in science experiences as young men up until age nine. After that age, the number of young women interested in science, mathematics, and technology classes drops. Not enrolling in science and mathematics classes in high school limits career options for young women, and their chance to succeed in a scientific or technical field becomes remote. Why is this happening? What can we, as educators, scientists, and parents do to address this problem? The literature identifies three principal factors that relate to the lack of female involvement in science classes: culture, attitude, and education. This paper reviews these factors and provides examples of programs that Pacific Northwest Laboratory (PNL) and others have developed to increase the number of young women entering college ready and wanting to pursue a career in a scientific or technical field.

23684 (SAND--94-1527) **Crisis prevention centers as confidence building measures: Suggestions for Northeast Asia.** Pregenzer, A.L. Sandia National Labs., Albuquerque, NM (United States). May 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95013872. Source: OSTI; NTIS; GPO Dep.

Relationships between countries generally exist somewhere in the grey area between war and peace. Crisis prevention activities are particularly important and should have two goals: stabilizing tense situations that could push countries toward war, and supporting or reinforcing efforts to move countries toward peace. A Crisis Prevention Center (CPC) should facilitate efforts to achieve these goals. Its functions can be grouped into three broad, inter-related categories: establishing and facilitating communication among participating countries; supporting negotiations and consensus-building on regional security issues; and supporting implementation of agreed confidence and security building measures. Technology will play a critical role in a CPC. First, technology is required to establishing communication systems and to provide the means for organizing and analyzing this information. Second, technically-based cooperative monitoring can provide an objective source of information on mutually agreed issues. In addition, technology can be a neutral subject of interaction and collaboration between technical communities from different countries. Establishing a CPC in Northeast Asia does not require the existence of an Asian security regime. Potential first steps for such a CPC should include establishing communication channels and a dedicated communications center in each country, together with an agreement to use the system as a "Hot Line" in bilateral and multilateral emergency situations. A central CPC could also be established as a regional communications hub. The central CPC could coordinate a number of functions aimed at stabilizing regional tensions and supporting confidence building activities, perhaps initially in an unofficial capacity. Specific recommendations for confidence building measures are discussed.

23685 (SAND--95-1251C) **Notes from a quarter century behind a green curtain.** Weiner, R.F. Sandia National Labs., Albuquerque, NM (United States). 27 Jun 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950601--16: Annual meeting of the American Nuclear Society (ANS), Philadelphia, PA (United States), 25-29 Jun 1995). Order Number DE95014601. Source: OSTI; NTIS; GPO Dep.

Experiences as an environmental activist have produced some insights into addressing the current public over-reaction to environmental risks, and in particular to the risks posed by nuclear industry development.

23686 (ANL–95/27) **Information exchange within the U.S. Department of Energy pollution prevention community.** Thuot, J.R. (Argonne National Lab., IL (United States). Environmental Management Operations). Argonne National Lab., IL (United States). Jul 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95016230. Source: OSTI; NTIS; GPO Dep.

Improving Pollution Prevention and Waste Minimization Program (PP/WMIN) technologies, actions, and culture could be an important cost-cutting step for the US Department of Energy (DOE). Communicating ideas, concepts, process changes, and achievements is essential for the success of this program. The need to openly communicate ideas and concepts in a cost-effective manner is essential in an organization that has such diverse components as research and development, weapons production, and power generation. This approach is in contrast to the historic DOE culture developed within the cold war period in which compartmentalization, independence, and secrecy were stressed. DOE has now recognized that for any pollution prevention program to be successful, the many diverse elements of the organization must share information. Avenues for such information exchange are examined in this report.

23687 (ANL/EA/CP–83912) **Hazardous waste cleanup: A case study for developing efficient programs.** Elcock, D.; Puder, M.G. Argonne National Lab., Washington, DC (United States). [1995]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9505208–2: Pacific basin conference on hazardous waste, Alberta (Canada), 7-12 May 1995). Order Number DE95013421. Source: OSTI; NTIS; GPO Dep.

As officials in Pacific Basin Countries develop laws and policies for cleaning up hazardous wastes, experiences of countries with such instruments in place may be instructive. The United States has addressed cleanups of abandoned hazardous waste sites through the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). The US Congress enacted CERCLA in 1980. The task of cleaning up waste sites became larger and more costly than originally envisioned and as a result, Congress strengthened and expanded CERCLA in 1986. Today, many industry representatives, environmentalists, and other interested parties say the program is still costly and ineffective, and Congress is responding through a reauthorization process to change the law once again. Because the law and modifications to it can affect company operations and revenues, industries want to know the potential consequences of such changes. Argonne National Laboratory (ANL) recently developed a baseline for one economic sector – the US energy industry – against which impacts of proposed changes to CERCLA could be measured. Difficulties encountered in locating and interpreting the data for developing that baseline suggest that legislation should not only provide for meeting its stated goals (e.g., protection of human health and the environment) but also allow for its efficient evaluation over time. This lesson can be applied to any nation contemplating hazardous waste cleanup laws and policies.

23688 (ANL/EA/SUMM–84723) **Addressing new policy directions for public scoping: The Multi-Purpose Canister environmental impact statement.** Young, C. (Argonne National Lab., IL (United States)); Metz, W.; Parker, G.J.; Macaluso, C. Argonne National Lab., IL (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950570–27: International high-level radioactive waste management conference: progress toward understanding, Las Vegas, NV (United States), 1-5 May 1995). Order Number DE95013435. Source: OSTI; NTIS; GPO Dep.

The Department of Energy recently completed the public scoping portion of its public participation program for the Multi-Purpose Canister environmental impact statement This impact statement will be prepared to decide whether to design and implement Multi-Purpose Canisters for managing spent nuclear fuel at commercial power plants. Stakeholders were notified about this impact statement through traditional methods, such as the Federal Register, and more innovative ones, such as electronic media. Educational materials were available to stakeholders to help them better understand the Multi-Purpose Canister programs Finally, diverse techniques were used to solicit comments from stakeholders, including structured comment forms and a toll-free facsimile number. This varied public participation effort addressed the spirit of emerging regulations and elicited nearly 1,000 comments from stakeholders across the country.

23689 (CONF-9506115–8) **Research and institutional dimensions of environmental justice: Implications for NEPA documentation.** Carnes, S.A.; Wolfe, A.K. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. From 20. National Association of Environmental Professionals annual conference and exposition: environmental challenges - the next twenty years; Washington, DC (United States); 10-13 Jun 1995. Order Number DE95014276. Source: OSTI; NTIS; GPO Dep.

Satisfying the environmental justice requirements imposed on the NEPA process is a challenging imperative. Among the challenges for NEPA documentation are: (1) adapting existing disciplinary methodologies that address distributional effects to the dictates of the executive order; (2) determining operational and, perhaps, threshold values for policy directives (e.g., disproportionately high and adverse effects); (3) identifying and involving representatives of minority, Native American, and low-income communities and populations in the NEPA process without jeopardizing their independence and integrity; (4) developing strategies, approaches, and methodologies that are more responsive to the consideration of multiple and cumulative exposures; and (5) developing professional standards for environmental justice assessment that are consistent with the letter and intent of the executive order, protective of the environments of minority, Native American, and low-income populations and communities, and useful to decision makers. This report will address current research and institutional activities associated with these issues, present alternative approaches available for their resolution, and identify the implications of those alternative approaches.

23690 (CONF-9506115–9) **From public participation to stakeholder involvement: The rocky road to more inclusiveness.** Peelle, E. Oak Ridge National Lab., TN (United States). [1995]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 20. National Association of Environmental Professionals annual conference and exposition: environmental challenges - the next twenty years; Washington, DC (United States); 10-13 Jun 1995. Order Number DE95014275. Source: OSTI; NTIS; GPO Dep.

Surviving always at the edge of extinction, public participation in environmental decision making has an uncertain and problematic history. From its emergence from the urban planning and delivery system efforts of the 1960s to many siting and non-siting uses today, it remains a battleground, with few successes and many failures. While some compelling structural, organizational and cultural explanations for this state of affairs exist, the author offers a further one–a too-limited definition and vision of public participation. One then can argue for a more inclusive process such as stakeholder involvement (SI) to enable a more viable approach to decision making. One can argue that the narrow conceptualization offered in the term public participation (PP) is partly responsible for the meager results of decades of efforts by earnest practitioners. Because of the limited, unique, and self-selected publics that respond to the major PP mechanisms such as public hearings, PP has become largely the province of organized activist groups and is largely accepted as such by most parties, including PP professionals. The author reviews the roles of Congress, federal agencies/proponents, local governments, activist groups and PP professionals in creating the current limited PP processes. She discusses trends and prospects for moving to broader based, more inclusive SI approaches. The emerging SI approach presents major methodological and organizational challenges, but offers the promise of outcomes more likely to be legitimated and potentially more lasting.

23691 (DOE/EA–0969) **Low Energy Accelerator Laboratory Technical Area 53, Los Alamos National Laboratory. Environmental assessment.** Los Alamos National Lab., NM (United

States). Apr 1995. 34p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012126. Source: OSTI; NTIS; INIS; GPO Dep.

This Environmental Assessment (EA) analyzes the potential environmental impacts that would be expected to occur if the Department of Energy (DOE) were to construct and operate a small research and development laboratory building at Technical Area (TA) 53 at the Los Alamos National Laboratory (LANL), Los Alamos, New Mexico. DOE proposes to construct a small building to be called the Low Energy Accelerator Laboratory (LEAL), at a previously cleared, bladed, and leveled quarter-acre site next to other facilities housing linear accelerator research activities at TA-53. Operations proposed for LEAL would consist of bench-scale research, development, and testing of the initial section of linear particle accelerators. This initial section consists of various components that are collectively called an injector system. The anticipated life span of the proposed development program would be about 15 years.

23692 (DOE/EH–231-059/1294) **PCB spill response and notification requirements.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Environmental Guidance. Dec 1994. 4p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95015491. Source: OSTI; NTIS; GPO Dep.

Polychlorinated biphenyls (PCBs) are a class of organic chemicals that had become widely used in industrial applications due to their practical physical and chemical properties. Historical uses of PCBs include dielectric fluids (used in utility transformers, capacitors, etc.), hydraulic fluids, and other applications requiring stable, fire-retardant materials. Due to findings that PCBs may cause adverse health effects and due to their persistence and accumulation in the environment. The Toxic Substances Control Act (TSCA), enacted on october 11, 1976, banned the manufacture of PCBs after 1978 [Section 6(e)]. The first PCB regulations, promulgated at 40 CFR Part 761, were finalized on February 17, 1978. These PCB regulations include requirements specifying disposal methods and marking (labeling) procedures, and controlling PCB use. To assist the Department of Energy (DOE) in its efforts to comply with the TSCA statute and implementing regulations, the Office of Environmental Guidance has prepared the document "Guidance on the Management of Polychlorinated Biphenyls (PCBs)." That document explains the requirements specified in the statute and regulations for managing PCBs including PCB use, storage, transport, and disposal. The Environmental Protection Agency (EPA) established regulations at 40 CFR 761 Subpart G for the reporting and cleanup of spills resulting from the release of any quantity of materiai containing PCBs at concentrations of $\geq$ 50 ppm. The regulations, known collectively as the TSCA Spill Cleanup Policy, contain requirements for the notification, cleanup, decontamination verification, and recordkeeping of PCB spills. This Information Brief supplements the PCB guidance document by responding to common questions concerning PCB spill response and notification requirements. It is one of a series of Information Briefs pertinent to PCB management issues.

23693 (DOE/EH–95010741) **Environmental guidance regulatory bulletin.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). RCRA/CERCLA Div. Dec 1994. 7p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95010741. Source: OSTI; NTIS; INIS; GPO Dep.

On September 22,1993, the Environmental Protection Agency (EPA) published [58 Federal Register (FR) 492001 the final OffSite Rule, which defines criteria for approving facilities for receiving waste from response actions taken under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). The off-site requirements apply to the off-site management of hazardous substances, pollutants, and contaminants, as defined under CERCLA, that are generated from remedial and removal actions funded or authorized, at least in part, by CERCLA. CERCLA-authorized cleanups include those taken under lead-agency authority, Section 106 Consent Orders, Consent Agreements, Consent Degrees, and Records of Decision (RODs). EPA requires that remedial actions at Federal facilities taken under Sections 104, 106, or 120 of CERCLA comply with the Off-Site Rule for all cleanups enacted through DOE's lead-agency authority.

23694 (DOE/EH–95015009) **Certain glycol ethers eliminated from toxic chemical release reporting requirements.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Environmental Guidance. Sep 1994. 2p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95015009. Source: OSTI; NTIS; GPO Dep.

Effective June 28, 1994, the U.S. Environmental Protection Agency (EPA) eliminated high molecular weight glycol ethers from the reporting requirements of section 313 of the Emergency Planning and Community Right-To-Know Act of 1986 (EPCRA). EPCRA (42 U.S.C. 11023) is also referred to as Title III of the Superfund Amendments and Reauthorization Act (SARA) of 1986. EPA redefined the glycol ethers category list of chemicals subject to reporting based on an EPA review of available human health data on short-chain glycol ethers. EPA is removing only the surfactant glycol ethers, which are high molecular weight glycol ethers, i.e., those with pendant alkyl groups and that typically have eight or more carbon atoms. The redefinition retains certain glycol ethers (i.e., ethylene glycol ethers where there are 1,2, or 3 repeating ethylene oxide groups) in the category. These are reasonably anticipated to cause adverse human health effects.

23695 (DOE/EIS–0217-Vol.1) **Savannah River Site Waste Management Environmental Impact Statement. Volume 1, Final.** USDOE Savannah River Operations Office, Aiken, SC (United States). Jul 1995. 796p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95015754. Source: OSTI; NTIS; INIS; GPO Dep.

Purpose of this environmental impact statement is to help DOE decide how to manage over the next 30 years liquid high-level radioactive, low-level radioactive, mixed, hazardous, and transuranic wastes generated during 40 years of past operations and on-going activities at Savannah River Site (SRS) in southwestern South Carolina. The wastes are currently stored at SRS. DOE seeks to dispose of the wastes in a cost-effective manner that protects human health and the environment. In this document, DOE assesses the cumulative environmental impacts of storing, treating, and disposing of the wastes, examines the impacts of alternatives, and identifies measures available to reduce adverse impacts. Evaluations of impacts on water quality, air quality, ecological systems, land use, geologic resources, cultural resources, socioeconomics, and the health and safety of onsite workers and the public are included in the assessment.

23696 (DOE/EIS–0232) **EIS Implementation Plan: Western-Sacramento 2004 Power Marketing Program.** USDOE, Washington, DC (United States). Mar 1995. 35p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012125. Source: OSTI; NTIS; GPO Dep.

Western-Sacramento currently serves 76 preference power customers in northern and central California. Due to the expiration of the long-term CVP power contracts and Contract 2948A on December 31, 2004, Western-Sacramento is developing a post-2004 Power Marketing Plan to analyze options for renewing and/or replacing these expiring contracts. The development and adoption of the Marketing Plan to market power from the Central Valley and Washoe projects is the subject of this environmental impact statement (EIS) process. Before Western-Sacramento defines a new power marketing program, Western-Sacramento will comply with the National Environmental Policy Act (NEPA) (42 USC 4321 through 4370d) environmental review procedures to determine the range of power marketing alternatives available and their associated environmental impacts and mitigation opportunities.

23697 (DOE/RL–93-66) **Hanford Remedial Action Environmental Impact Statement, Richland, Washington. Implementation Plan.** USDOE Richland Operations Office, WA (United States). Jun 1995. 167p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014919. Source: OSTI; NTIS; INIS; GPO Dep.

This implementation plan was prepared in compliance in compliance with 10 CFR 1021. It includes the following sections:

introduction; purpose and need for departmental action; scope, content, and alternatives for the HRA EIS; public participation process; schedule for preparation of the HRA EIS; anticipated environmental reviews and consultations; and contractor disclosure statement. The following appendices are also included: notice of intent, federal register notice for extension of public scoping period, proposed annotated outline for the draft HRA EIS, summary of final report for the Hanford Future Site Uses Working Group, and summary of comments and responses from the public scoping process.

23698 (ENEA-RT-AMB--94-27) **Analysis of quality life in two factories of Civita Castellana pottery district (Italy).** Dai Pra', L. (ENEA, Casaccia (Italy). Area Energia Ambiente e Salute); Delle Fratte, A.; Salerno, S. ENEA, Casaccia (Italy). Area Energia Ambiente e Salute. Nov 1994. 88p. (In Italian). Order Number DE95789768. Source: OSTI; NTIS (US Sales Only).

The aim of this research is the analysis of job satisfaction and quality of life in two of the most important representative factories of Civita Castellana pottery district located near Rome (Italy). The two factories were before studied by the Method of Organizational Congruences (MOC) and the results obtained published in another technical report (ENEA-RT-AMB--93-24). It is analized worker's job and life satisfaction by a structured interview with various open questions in such a way to reveal also many hidden feelings. The 103 structured interviews (in-table-ware 17 women and 55 men; in sanitary-ware 30 men and 1 woman) emphasize the experience at work, the opinions and attitudes about it and the style of life. The results obtained confirm the different Organizational Constraint (OC) in the two factories that have various degrees of technology innovation. Nevertheless the workers who were interviewed show high job satisfaction and high degree of life: This incongruence is dealt with in this work.

23699 (ETDE-DE--109) **Use of renewable energy sources in Bavaria - state of the art and potential assessment. A climate protection study.** Umwelt und Entwicklung Bayern. Materialien, v. 86. Landtechnischer Verein in Bayern e.V., Freising (Germany). Apr 1993. 312p. (In German). Sponsored by Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany). Order Number DE95778136. Source: OSTI; NTIS (US Sales Only).

This study wants to give an overview of renewable or recoverable energy sources. Following an introduction giving exact definitions of individual techniques, the potential of each energy source is assessed. The potential that these energy sources have for reducing the atmospheric pollution burden is particularly dealt with. However, the focus of the study is on the current practical use of renewable energy sources. Several inquiries with a great number of firms were to provide information on the number of existing plants and their technical standard. Some plants were included in reference lists. (orig./HW)

23700 (ETDE-DE--176) **Europe - environmental compatibility without frontiers?.** Journalistenseminar der Information Umwelt, v. 14. Assmann, G. (comp.); Froese, B. (comp.); Haury, H.J. (comp.); Jahn, T. (comp.). GSF - Forschungszentrum fuer Umwelt und Gesundheit Neuherberg GmbH, Oberschleissheim (Germany). Projekt Information Umwelt. 1994. 77p. (In German). (CONF-9408243--: 14. journalists seminar on environmental information: Europe - environmentally friendly without limits?, Frankfurt am Main (Germany), 4 Aug 1994). Order Number DE95795828. Source: OSTI; NTIS (US Sales Only).

The seven contributions discuss decision processes in European environmental protections, environmental associations within the European Union, trends in European waste management policy and their effecsts on EC member states, and the problem of environmental protection in central and Eastern Europe. The particular importance of agricultural and traffic policy in the contect of environmental policy is pointed out. (DG)

23701 (IAEA-TECDOC--793) **Nuclear power: An overview in the context of alleviating greenhouse gas emissions.** International Atomic Energy Agency, Vienna (Austria); Nuclear Energy Agency, 75 - Paris (France). Apr 1995. 41p. Order Number DE95631168. Source: OSTI; NTIS (US Sales Only); INIS.

The document gives a brief overview of the current development of nuclear power worldwide, covering essentially technical, economic and environmental aspects. Policy issues related to implementation instruments and potential barriers to nuclear power deployment are also touched upon. Views are given on the possible medium and long term development of nuclear power, as a means for alleviating greenhouse gas emissions from the electricity sector. Advanced technologies for the reactors and their associated fuel cycles are described, including advanced fission reactors and fusion energy. Direct cost and externalities are given for the present generation of nuclear power plants as well as for power plants to be commissioned in the coming decades. Environmental burdens and risks are analysed with emphasis on potential risks of accident, radioactive waste, and atmospheric emission in routine operation, focusing on greenhouse gases. 77 refs, 1 fig., 4 tabs.

23702 (ORNL/TM--13031) **The use of explosives by the US Antarctic Program. Environmental report.** Ensminger, J.T.; Blasing, T.J. Oak Ridge National Lab., TN (United States). Jun 1995. 39p. Sponsored by National Science Foundation, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95016398. Source: OSTI; NTIS; GPO Dep.

This report was prepared to assist principal investigators and others in complying with NEPA and the protocol on environmental protection to the Antarctic Treaty. Research activities and associated support operations in Antarctica sometimes require use of explosives. This report evaluates potential environmental impacts associated with such activities and possible methods for mitigating those impacts. The greatest single use of explosives, and the only type of blasting that will occur on the Polar Plateau (an exception is the rare use of explosives to cave in dangerous ice for safety reasons), is for seismic surveys. The charges for these are small-scale, are placed in or on the snow or ice, are distributed linearly over long distances, and present no potential impacts to soil or geological substrata. Impacts from those would be less than minor or transitory. Wherever possible, blasting holes in sea ice will be replaced by drilling by auger or melting. Other uses of explosives, such as in geologic research and construction, are discussed.

23703 (PNL-SA--25942) **Federal, state and utility roles in reducing new building greenhouse gas emissions.** Johnson, J.A. (Pacific Northwest Lab., Richland, WA (United States)); Shankle, D.; Boulin, J. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9503114--2: 3. national new construction programs for demand side management conference, Boston, MA (United States), 26-29 Mar 1995). Order Number DE95014617. Source: OSTI; NTIS; GPO Dep.

This paper will explore the role of implementation of building energy codes and standards in reducing US greenhouse gas emissions. It will discuss the role of utilities in supporting the US Department of Energy (DOE) and the Environmental Protection Agency in improving the efficiency of new buildings. The paper will summarize Federal policies and programs that improve code compliance and increase overall greenhouse gas emission reductions. Finally, the paper will discuss the role of code compliance and the energy and greenhouse gas emission reductions that have been realized from various Federal, State and utility programs that enhance compliance.

23704 (PNL-SA--25948) **The value added of conducting regional versus local stakeholder involvement in evaluating technology acceptance.** McCabe, G.H. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950646--24: Air and Waste Management Association meeting, San Antonio, TX (United States), 18-23 Jun 1995). Order Number DE95014628. Source: OSTI; NTIS; INIS; GPO Dep.

Battelle has conducted a three-year effort, funded by the U. S Department of Energy's (DOE) Office of Technology Development, to involve stakeholders in evaluating innovative technologies to clean up volatile organic compound (VOC) contamination at arid sites. Stakeholders have been encouraged to participate in the demonstration of these innovative technologies in order to improve

decisions made by DOE and its contractors about technology development, demonstration, and deployment. The basic approach is to identify people and organizations with a stake in the remediation process, and hence in the demonstration of innovative technologies. Stakeholders have included public interest group and environmental group representatives, regulators, technology users, Native Americans, Hispanic community members, and local elected officials. These people are invited to be involved and they are presented with substantive information about the technologies. Their input in terms of identifying issues and concerns, defining the kinds of information needed from the demonstrations, and assessing the acceptability of the technologies for deployment, will help ensure that only broadly promising technologies are carried forward. This approach is designed to increase the likelihood of successful deployment of the new technologies needed to accomplish environmental restoration throughout the DOE complex and at private facilities. The hypothesis in conducting this regional stakeholder involvement program is that there will be different data requirements for different sites due to geographical, institutional, programmatic, and cultural differences at the sites. Identifying the broadest set of data requirements, collecting this information during the technology demonstration, and providing the results of the demonstration to stakeholders will enhance the acceptance of the technology at these sites and, thereby, enhance the technology's deployability.

23705 (PNL-SA–26129) **Using new replication features of Oracle 7 in emergency management system.** Loveall, R.M. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 9p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9504186–1: ORACLE/DOE special interest group meeting on emergency management system, Richland, WA (United States), 19-21 Apr 1995). Order Number DE95014631. Source: OSTI; NTIS; GPO Dep.

Pacific Northwest Laboratory is developing an application for the Army and the Federal Emergency Management Agency to support emergency management of hazards resulting from the accidental release of chemical agents during their storage or destruction. This application, called the Federal Emergency Management Information System (FEMIS), uses Oracle7.1 in a client/server configuration. At each Army site where FEMIS is deployed, there will be two or more servers and about 25 users on client personal computers (PCs) connected to each server. The Oracle Data Base Management System is configured as a multiserver, distributed data base using partitioning to share information between the Oracle instances. The information in the individual partitioned tables is merged by Union operators to form a set of site-wide views. This data base contains more than 180 tables and about 40 additional site views. Oracle snapshot replication was chosen rather than distributed queries in order to achieve autonomous operation and improve failure tolerance. The presentation will describe this architecture and discuss how the data was partitioned. Some useful techniques for generating the scripts that produce the data base will also be discussed.

23706 (PNL-SA–26159) **Destruction of chlorofluorocarbons and halons.** Matchett, J.M.; Miller, K.B.; Purcell, C.W. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9506115–10: 20. National Association of Environmental Professionals annual conference and exposition: environmental challenges - the next twenty years, Washington, DC (United States), 10-13 Jun 1995). Order Number DE95014621. Source: OSTI; NTIS; GPO Dep.

The Montreal Protocol on Substances that Deplete the Ozone Layer requires the phaseout of ozone-depleting substances in most developed countries by January 1, 1996. Developing, or Article 5, countries have been allowed additional time in which to produce these chemicals. Contrary to the Protocol's intent, current estimates indicate that production of these chemicals by Article 5 countries could easily equal that of the developed world before their production is required to be eliminated. The Montreal Protocol also requires that used chlorofluorcarbons (CFCs) and halons are disposed of in an environmentally acceptable manner. One mechanism devised by the Montreal Protocol to reduce the amount of ozone-depleting substances that may need to be destroyed is to transfer those chemicals to Article 5 countries. Theoretically, this has the added benefit of also eliminating the need for additional production by those countries. This paper discusses the major issues associated with the disposal/destruction of ozone-depleting substances, including the transfer of these chemicals to Article 5 countries. Potential implications of the barriers to ozone-depleting substance transfer on the viability of the Montreal Protocol will also be discussed.

23707 (SAND–95-1434/2) **Style, content and format guide for writing safety analysis documents: Volume 2, Safety assessment reports for DOE non-nuclear facilities.** Mahn, J.A.; Silver, R.C.; Balas, Y.; Gilmore, W. Sandia National Labs., Albuquerque, NM (United States). Jul 1995. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95015734. Source: OSTI; NTIS; GPO Dep.

The purpose of Volume 2 of this 4-volume style guide is to furnish guidelines on writing and publishing Safety Assessment Reports (SAs) for DOE non-nuclear facilities at Sandia National Laboratories. The scope of Volume 2 encompasses not only the general guidelines for writing and publishing, but also the prescribed topics/appendices contents along with examples from typical SAs for DOE non-nuclear facilities.

23708 (UCRL-ID–121067) **The Aegis initiative: An integrated, real-time, environmental monitoring and response management capability. Final report.** Smart, J.C.; Vellinger, R.J. Lawrence Livermore National Lab., CA (United States). 21 Mar 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95013918. Source: OSTI; NTIS; GPO Dep.

The Aegis system at Lawrence Livermore National Laboratory (LLNL) is being developed to provide a real-time emergency response management capability for a diverse range of environmental monitoring applications. The Aegis system is designed to integrate a variety of environmental, emergency, and process monitoring sensor systems using a flexible, modular architecture that can be readily configured for any number of industrial, commercial, or government sites. Several unique LLNL technologies are being integrated via this effort that will provide tracking of environmental contaminants, real-time identification of potentially unacceptable conditions, and facilitation of emergency or measured response management operations. Potential areas of application include: monitoring-surface/ground water, air, radiation; waste effluent & storm/drain line; water quality (water storage, treatment, and distribution); fixed processes, safety systems; critical facilities; hazardous spill management; rapid environmental monitoring deployment; watershed protection; ecosystem management and restoration; enforcement and compliance.

23709 (WHC-SA–2722) **A model for determining the scope and level of detail that is appropriate for a programmatic EIS.** Eccleston, C.H. Westinghouse Hanford Co., Richland, WA (United States). Mar 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9506115–3: 20. National Association of Environmental Professionals annual conference and exposition: environmental challenges - the next twenty years, Washington, DC (United States), 10-13 Jun 1995). Order Number DE95012574. Source: OSTI; NTIS; INIS; GPO Dep.

Since the inception of the National Environmental Policy Act (NEPA), no definitive guidance has been established for determining the scope of topics and issues, or the level of detail suitable for presentation within a Programmatic Environmental Impact Statement (P-EIS). Lacking such guidance, an inordinate amount of time and resources can be expended in determining the scope that is most appropriately addressed within a P-EIS versus the more detailed scope that is best reserved for lower-tier documents. Faced with this predicament, agencies often err on the side of including too much detail, resulting in P-EISs that are over bloated and unnecessarily complex. Moreover, lack of definitive guidance leads to a great deal of inconsistency in the preparation of P-EISs among federal agency programs. A paradigm for assisting decisionmakers in making such determinations is presented below. This model expedites the preparation of P-EISs by providing a consistent and systematic approach for determining the scope and level of detail

that is most appropriately addressed at the programmatic level. In many cases, the model provides agencies with an effective tool for managing and streamlining the NEPA process by de-scoping needless and unnecessary issues from the scope of a P-EIS.

23710 (DOE/EIA–0035(95/07)) **Monthly energy review, July 1995.** USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use. 24 Jul 1995. 182p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95015816. Source: OSTI; NTIS; GPO; GPO Dep.

Energy production during April 1995 totaled 5.5 quadrillion Btu, a 1.0-percent decrease from the level of production during April 1994. Coal production decreased 7.7 percent, natural gas increased 1.3 percent, and production of crude oil and natural gas plant liquids increased 0.3 percent. All other forms of energy production combined were up 8.6 percent from the level of production during April 1994.

23711 (BNL–61738) **The Amtex DAMA Project: The Brookhaven contribution.** Peskin, A.M. Brookhaven National Lab., Upton, NY (United States). Jan 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95013259. Source: OSTI; NTIS; GPO Dep.

The Amtex Partnership organized in 1993 as a Technology Transfer Collaboration among members of the integrated textile industry, the DOE National Laboratories, a number of universities, and several research/education/technology transfer organizations (RETTs). Under the Amtex umbrella organization, a number of technology areas were defined and individual projects were launched addressing various aspects of improving the health and competitiveness of the American textile industry. The first and, to date, the largest of these has been the computer-based Demand Activated Manufacturing Architecture (DAMA) project. Brookhaven National Laboratory became involved in DAMA beginning in March of 1993 and remained an active participant through January of 1995. It was staffed almost exclusively with personnel of the Computing and Communications Division. This document summarizes the activities and accomplishments of the Brookhaven team in working with the larger collaboration. Detailed information about the Amtex Partnership, the DAMA Project, and specific BNL contributions are documented elsewhere.

23712 (DOE/ER–0649T) **Graduate student theses supported by DOE's Environmental Sciences Division.** Cushman, R.M. (Oak Ridge National Lab., TN (United States)); Parra, B.M. USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Jul 1995. 128p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95015971. Source: OSTI; NTIS; GPO Dep.

This report provides complete bibliographic citations, abstracts, and keywords for 212 doctoral and master's theses supported fully or partly by the U.S. Department of Energy's Environmental Sciences Division (and its predecessors) in the following areas: Atmospheric Sciences; Marine Transport; Terrestrial Transport; Ecosystems Function and Response; Carbon, Climate, and Vegetation; Information; Computer Hardware, Advanced Mathematics, and Model Physics (CHAMMP); Atmospheric Radiation Measurement (ARM); Oceans; National Institute for Global Environmental Change (NIGEC); Unmanned Aerial Vehicles (UAV); Integrated Assessment; Graduate Fellowships for Global Change; and Quantitative Links. Information on the major professor, department, principal investigator, and program area is given for each abstract. Indexes are provided for major professor, university, principal investigator, program area, and keywords. This bibliography is also available in various machine-readable formats (ASCII text file, WordPerfect® files, and PAPYRUS™ files).

23713 (NEDO-OS–9401) **Research and development project plans for FY 1994. 1. Research and development of new energy.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Apr 1994. 135p. Order Number DE95790767. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

Plans were introduced for research and development of new energy for fiscal 1994. Plans stated in coal conversion technology were such as implementation plan for developing coal liquefaction technology, implementation plan for developing technology for coal-based hydrogen production, implementation plan for research and development of coal hydrogenation gasification technology, implementation plan for development of next generation of coal utilization technology, implementation plan for clean coal technology promotion project, and implementation plan for international coal utilization project. Plans stated in solar energy technology were such as implementation plan for research on thin substrate polycrystalline solar cell manufacturing technology development, implementation plan for research on thin film solar cell manufacturing technology, implementation plan for super high-efficiency solar cell technology development, implementation plan for developing technology for photovoltaic power generation systems, and implementation plan for international cooperative research and development project on photovoltaic power generation systems. Plans stated in geothermal energy technology were such as development of a binary cycle power generation plant, development of a hot dry rock power generation system, and development of drilling and production technology for deep-seated geothermal resources. Plans stated in other categories were such as fuel cell power generation technology and alcohol and biomass energy technology.

23714 (ORNL/TM–12902) **High Temperature Materials Laboratory seventh annual report, October 1993–September 1994.** Tennery, V.J.; Teague, P.A. Oak Ridge National Lab., TN (United States). Dec 1994. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95013968. Source: OSTI; NTIS; GPO Dep.

The High Temperature Materials Laboratory (HTML) has completed its seventh year of operation as a designated Department of Energy User Facility at the Oak Ridge National Laboratory. Growth of the User Program has been demonstrated by the number of institutions executing user agreements since the HTML began operation in 1987. A total of 193 nonproprietary agreements (91 industry and 102 university) and 41 proprietary agreements (39 industry and two university) are now in effect. This represents an increase of 21 nonproprietary user agreements during FY 1994. Forty-one states are represented by these users. During FY 1994, the HTML User Program evaluated 106 nonproprietary proposals (46 from industry, 52 from universities, and 8 from other government facilities) and 8 proprietary proposals. The HTML User Advisory Committee approved about ninety-five percent of those evaluated proposals, sometimes after the prospective user revised the proposal based on comments from the Committee. This annual report discusses FY 1994 activities in the individual user centers, as well as plans for the future. It also gives statistics about users and their proposals and FY 1994 publications, and summarizes nonproprietary research projects active in FY 1994.

23715 (PNL–10519-2) **The AMTEX Partnership. Second quarter report, Fiscal Year 1995.** Lemon, D.K. (AMTEX Partnership (United States)); Quisenberry, R.K. Pacific Northwest Lab., Richland, WA (United States); AMTEX Partnership (United States). Mar 1995. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015136. Source: OSTI; NTIS; GPO Dep.

The AMTEX Partnership™ is a collaborative research and development program among the US Integrated Textile Industry, the Department of Energy (DOE), the national laboratories, other federal agencies and laboratories, and universities. The goal of AMTEX is to strengthen the competitiveness of this vital industry, thereby reserving and creating US jobs. The operations and program management of the AMTEX Partnership is provided by the Program Office. This report is produced by the Program Office on

a quarterly basis and provides information on the progress, operations, and project management of the partnership.

23716 (SAND–94-1945) **ITEP: A survey of innovative environmental restoration technologies in the Netherlands and France.** Roberds, W.J. (Golder Associates, Inc., Redmond, WA (United States)); Voss, C.F.; Hitchcock, S.A. Sandia National Labs., Albuquerque, NM (United States); Golder Associates, Inc., Redmond, WA (United States). May 1995. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95015057. Source: OSTI; NTIS; INIS; GPO Dep.

The International Technology Exchange Program (ITEP) of the Department of Energy's (DOE's) Office of Environmental Management (EM) is responsible for promoting the import of innovative technologies to better address EM's needs and the export of US services into foreign markets to enhance US competitiveness. Under this program, potentially innovative environmental restoration technologies, either commercially available or under development in the Netherlands and France, were identified, described, and evaluated. It was found that 12 innovative environmental restoration technologies, which are either commercially available or under development in the Netherlands and France, may have some benefit for the DOE EM program and should be considered for transfer to the United States.

23717 (SAND–94-1946) **A survey of environmental needs and innovative technologies in Germany.** Voss, C.F. (Golder Associates, Inc., Redmond, WA (United States)); Roberds, W.J. Sandia National Labs., Albuquerque, NM (United States); Golder Associates, Inc., Redmond, WA (United States). May 1995. 132p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95015058. Source: OSTI; NTIS; INIS; GPO Dep.

The International Technology Program (IT?), formerly the international Technology Exchange Program (ITEP), of the Department of Energy's (DOE's) Office of Environmental Restoration and Waste Management (EM) is responsible for promoting: (1) the import of innovative technologies to better address EM's needs; and (2) the export of US services into foreign markets to enhance US competitiveness. Under this program: (1) the environmental restoration market in Germany was evaluated, including the description of the general types of environmental problems, the environmental regulations, and specific selected contaminated sites; and (2) potentially innovative environmental restoration technologies, either commercially available or under development in Germany, were identified, described and evaluated. It was found that: (1) the environmental restoration market in Germany is very large, on the order of several billion US dollars per year, with a significant portion possibly available to US businesses; and (2) a large number (54) of innovative environmental restoration technologies, which are either commercially available or under development in Germany, may have some benefit to the DOE EM program and should be considered for transfer to the US.

23718 (UCRL-ID–114972-2) **SERS internship: Spring 1994 abstracts and research papers.** Goldman, B. Lawrence Livermore National Lab., CA (United States). 6 May 1994. 195p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9405328–Absts.: Science and Engineering Research Semester (SERS) student symposium, Livermore, CA (United States), 6 May 1994). Order Number DE95014118. Source: OSTI; NTIS; GPO Dep.

This document contains abstracts from the science and engineering research semester from the Lawrence Livermore National Laboratory. Projects cover many areas in the fields of contaminant removal from the environment, physics, and genetics research. Individual projects were processed separately for the Department of Energy databases.

23719 (ETDE-DE–138) **Climate-compatible energy supply in Baden-Wuerttemberg. Rational use of electricity in households.** Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg. Arbeitsberichte, v. 10. Baur, J. (Stuttgart Univ. (Germany). Inst. fuer Energiewirtschaft und Rationelle Energieanwendung (IER)); Bohnhoff, C.; Fahl, U.; Voss, A. Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg, Stuttgart (Germany). Apr 1994. 124p. (In German). Order Number DE95790278. Source: OSTI; NTIS (US Sales Only).

The report contains technical analyses of household appliances which are not used for room or service water heating (coolers and refrigerators; cooking appliances; washing machines and driers; dishwashers; lighting; small appliances). Each group of appliances is analyzed in five steps. In the first step, "technology description", the function and technical variants of the systems are described. The second step analyzes technical and non-technical options for consumption reduction. In the third step, the structure of the present "appliances park" is described. the fourth step analyzes average and optimum consumption data, while the fifth step goes into "technology-related obstacles". The investigations were carried out for the purpose of determining the potential contribution of low-consumption household appliances to energy savings and pollutant reduction today and tomorrow.

2920 Supply, Demand, and Forecasting

Refer also to citation(s) 23099, 23682, 23730

23720 (DOE/EIA–0484(95)) **International energy outlook 1995, May 1995.** USDOE Energy Information Administration, Washington, DC (United States). Office of Integrated Analysis and Forecasting. Jun 1995. 103p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014139. Source: OSTI; NTIS; GPO; GPO Dep.

The International Energy Outlook 1995 (IEO95) presents an assessment by the Energy Information Administration (EIA) of the international energy market outlook through 2010. The report is an extension of the EIA's Annual Energy Outlook 1995 (AEO95), which was prepared using the National Energy Modeling System (NEMS). US projections appearing in the IEO95 are consistent with those published in the AEO95. IEO95 is provided as a statistical service to energy managers and analysts, both in government and in the private sector. The projects are used by international agencies, Federal and State governments, trade associations, and other planners and decisionmakers. They are published pursuant to the Department of energy Organization Act of 1977 (Public Law 95-91), Section 295(c). The IEO95 projections are based on US and foreign government policies in effect on October 1, 1994. IEO95 displays projections according to six basic country groupings. The regionalization has changed since last year's report. Mexico has been added to the Organization for Economic Cooperation and Development (OECD), and a more detailed regionalization has been incorporated for the remainder of the world, including the following subgroups: non-OECD Asia, Africa, Middle East, and Central and South America. China is included in non-OECD Asia. Eastern Europe and the former Soviet Union are combined in the EE/FSU subgroup.

23721 (ETDE-BR–0019) **Integrated energy plan for Minas Gerais state, Brazil.** Companhia Energetica de Minas Gerais (CEMIG), Belo Horizonte, MG (Brazil). Apr 1993. 139p. (In Portugese). Order Number DE95789963. Source: OSTI; NTIS (US Sales Only).

The energetic matrix of Minas Gerais state, Brazil is presented mentioning all the resources available and analysing the energy supply and demand on a integrated way. The critical points and action lines in the energy sector aiming the economic growth of the

state are identified. The impacts over the vegetation and the possible deficits in the charcoal and firewood demand are studied in order to promote the conservation and the energy substitution by the charcoal consumers. The energy conservation is also shown by the residue recovery from the industrial sector as siderurgical gases and sugar cane bagasse by the cogeneration. It is presented also the main aspects of natural gas coming for the state with a forecasting for the year 2000 when this source of energy will participate with 4% in the State Energetic Matrix. 25 figs, 54 tabs

2930 Policy, Legislation, and Regulation

23722 (DOE/IG–0002/95) **Semiannual report to Congress, October 1, 1994–March 31, 1995.** USDOE Office of Inspector General, Washington, DC (United States). Apr 1995. 78p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI.

The Office of Inspector General Semiannual Report to the Congress covers the period October 1, 1994, through March 31, 1995. The report summarizes significant audit, inspection and investigative accomplishments for the reporting period, a large number of which facilitated Department management's efforts to improve management controls and ensure efficient and effective operation. Narratives of the most significant reports are grouped by six primary performance measures: (1) Recommendations accepted by management, (2) Audit/inspection savings, recoveries, and funds identified for better use, (3) Legislative/regulatory compliance to recommendations, (4) Positive impacts on the Department after implementation of recommendations, (5) Complaints resolved, and (6) Investigation recoveries, fines, and funds identified for better use.

23723 (NUREG/CR–6307) **Summary of comments received at workshop on use of a Site Specific Advisory Board (SSAB) to facilitate public participation in decommissioning cases.** Caplin, J. (Advanced Systems Technology, Inc., Rockville, MD (United States)); Padge, G.; Smith, D.; Wiblin, C. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications; Advanced Systems Technology, Inc., Rockville, MD (United States). Jun 1995. 103p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

The Nuclear Regulatory Commission (NRC) is conducting an enhanced participatory rulemaking to establish radiological criteria for the decommissioning of NRC-licensed facilities. As part of this rulemaking, On August 20, 1994 the NRC published a proposed rule for public comment. Paragraph 20.1406(b) of the proposed rule would require that the licensee convene a Site Specific Advisory Board (SSAB) if the licensee proposed release of the site for restricted use after decommissioning. To encourage comment the NRC held a workshop on the subject of $SABs on December 6, 7, and 8, 1994. This report summarizes the 567 comments categorized from the transcript of the workshop. The commenters at the workshop generally supported public participation in decommissioning cases. Many participants favored promulgating requirements in the NRC's rules. Some industry participants favored relying on voluntary exchanges between the public and the licensees. Many participants indicated that a SSAB or something functionally equivalent is needed in controversial decommissioning cases, but that some lesser undertaking can achieve meaningful public participation in other cases. No analysis or response to the comments is included in this report.

23724 (NUREG/CR–6330) **Results of regulatory impact survey of industrial and medical materials licensees of the Office of Nuclear Material Safety and Safeguards.** Lach, D. (Battelle Human Affairs Research Center, Seattle, WA (United States)); Melber, B.; Brichoux, J.; Hattrup, M.; Conger, R.; Hughes, K. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Industrial and Medical Nuclear Safety; Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 87p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC06-76RL01830. (PNL–10548). Source: OSTI; NTIS; GPO; INIS.

This report presents the findings of a regulatory impact survey of nuclear materials licensees of the United States Nuclear Regulatory Commission (NRC). Commissioners of the NRC directed staff to provide the Commission with first hand information from licensees that could be used to improve the overall regulatory program. A self-administered, mail-out survey questionnaire was used to collect data from a sample of licensees who had interaction with the NRC during the previous 12 months. A total of 371 respondents of the 589 who were sent questionnaires returned completed surveys, for a response rate of 63%. The body of the report presents the findings of the survey including a brief introduction to the approach used, followed by survey findings regarding regulations, policies and regulatory guidance; experience with licensing applications, renewals and amendments; inspections; reporting requirements; and enforcement actions. The appendices of the report include a copy of the survey as administered to licensees, a fuller description of the survey design and data collection methods, and detailed graphic material describing survey responses.

Sponsored by USDOE, Washington, DC (United States);Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950414–5: 57. annual American power conference, Chicago, IL (United States), 18-20 Apr 1995). Order Number DE95013786. Source: OSTI; NTIS; GPO Dep.

This paper summarizes the transmission system data resources used to construct a North American network representation modeled in the Spot Market Network (SMN) model developed at Argonne National Laboratory (ANL). The data, largely available through various FERC Form 715 reports, are used to construct a network representation capable of modeling interarea transfer opportunities between modeled systems. A brief introduction of the SMN model and the desired level of transmission detail is first described. Next, various data resources that report published transfer capabilities essential to model operation are introduced. Modifications or adaptations of individual published network topologies are described, which are supported through extensive examinations of alternate data sources, as well as through discussions with knowledgeable operations experts or regional staff. The method of obtaining the current SMN network formulation is finally presented to illustrate the integration of regional and subregional network detail into the North American SMN transmission representation.

23727 (CONF-941089–Vol.1, pp. 23-37) **Electric power industry in Korea: Past, present, and future.** Lee, Hoesung. US-DOE, Washington, DC (United States); Korea Electric Power Corp. (KEPCO), Seoul (Korea, Republic of). [1994]. From US-Korea electric power generation seminar mission; Seoul (Korea, Republic of); 24-28 Oct 1994. In *US-Korea Electric Power Generation Seminar Mission: Proceedings, Volume 1.* 459p. Order Number DE95011612. Source: OSTI; NTIS; INIS; GPO Dep.

Electrical power is an indispensable tool in the industrialization of a developing country. An efficient, reliable source of electricity is a key factor in the establishment of a wide range of industries, and the supply of energy must keep pace with the increasing demand which economic growth creates in order for that growth to be sustained. As one of the most successful of all developing countries, Korea has registered impressive economic growth over the last decade, and it could be said that the rapid growth of the Korean economy would not have been possible without corresponding growth in the supply of electric power. Power producers in Korea, and elsewhere in Asia, are to be commended for successfully meeting the challenge of providing the necessary power to spur what some call an economic miracle. The future continues to hold great potential for participants in the electrical power industry, but a number of important challenges must be met in order for that potential to be fully realized. Demand for electricity continues to grow at a staggering rate, while concerns over the environmental impact of power generating facilities must not be ignored. As it becomes increasingly difficult to finance the rapid, and increasingly larger-scale expansion of the power industry through internal sources, the government must find resources to meet the growing demand at least cost. This will lead to important opportunities for the private sector. It is important, therefore, for those interested in participating in the power production industry and taking advantage of the newly emerging opportunities that lie in the Korean market, and elsewhere in Asia, to discuss the relevant issues and become informed of the specific conditions of each market.

23728 (CONF-9506115–7) **Decision-making in demand-side management collaboratives: The influence of non-utility parties on electric-utility policies and programs.** Schweitzer, M. (Oak Ridge National Lab., TN (United States)); English, M.; Schexnayder, S. Oak Ridge National Lab., TN (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 20. National Association of Environmental Professionals annual conference and exposition: environmental challenges - the next twenty years; Washington, DC (United States); 10-13 Jun 1995. Order Number DE95013977. Source: OSTI; NTIS; GPO Dep.

Since the late 1980s, a number of electric utilities and interested non-utility parties (NUPs)-such as environmental groups, large industrial customers, and state government agencies-have tried a new approach to reaching agreement on program design and policy issues related to utility use of Demand-Side Management (DSM) resources. Through this new arrangement, known as the DSM collaborative process, parties who have often been adversaries attempt to resolve their differences through compromise and consensus rather than by using traditional litigation. This paper-which is based on studies of over a dozen collaboratives nationwide-discusses the organizational structure of collaboratives, the ways in which NUPs have been involved in the decision-making process, and how the amount of influence exerted by the NUPs is related to collaborative accomplishments. Most of the collaboratives studied had two organizational levels: a "working group" that provided policy direction and guidance for the collaborative and "subgroups" that performed the detailed tasks necessary to flesh out individual DSM programs. Most collaboratives also had a coordinator who was charged with scheduling meetings, exchanging information, and performing other important organizational functions, and it was common for the utility to fund consultants to provide expert assistance for the NUPs. In general, the utilities reserved the final decision-making prerogative for themselves, in line with their ultimate responsibility to shareholders, customers, and regulators. Still, there was substantial variation among the collaboratives in terms of how actively consensus was sought and how seriously the inputs of the NUPs were taken. In general, the collaboratives that resulted in the largest effects on utility DSM usage were those in which the utilities were most willing to allow their decisions to be shaped by the NUPs.

23729 (DOE/EIA–0191(94)) **Cost and quality of fuels for electric utility plants, 1994.** USDOE Energy Information Administration, Washington, DC (United States). Office of Coal, Nuclear, Electric and Alternate Fuels. 14 Jul 1995. 170p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95015577. Source: OSTI; NTIS; GPO; GPO Dep.

This document presents an annual summary of statistics at the national, Census division, State, electric utility, and plant levels regarding the quantity, quality, and cost of fossil fuels used to produce electricity. Purpose of this publication is to provide energy decision-makers with accurate, timely information that may be used in forming various perspectives on issues regarding electric power.

23730 (DOE/EIA–0226(95/06)) **Electric power monthly, June 1995 with data for March 1995.** USDOE Energy Information Administration, Washington, DC (United States). Office of Coal, Nuclear, Electric and Alternate Fuels. 19 Jun 1995. 185p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014402. Source: OSTI; NTIS; GPO; GPO Dep.

The Coal and Electric Data and Renewables Division; Office of Coal, Nuclear, Electric and Alternate Fuels, Energy Information Administration (EIA), Department of Energy prepares the EPM. This publication provides monthly statistics at the State, Census division, and US levels for net generation, fossil fuel consumption and stocks, quantity and quality of fossil fuels, cost of fossil fuels, electricity sales, revenue, and average revenue per kilowatthour of electricity sold. Data on net generation, fuel consumption, fuel stocks, quantity and cost of fossil fuels are also displayed for the North American Electric Reliability Council (NERC) regions. The EIA publishes statistics in the EPM on net generation by energy source; consumption, stocks, quantity, quality, and cost of fossil fuels; and capability of new generating units by company and plant. 68 tabs.

23731 (DOE/EIA–M068(95)App.) **Documentation of the Electricity Market Module (EMM). Appendix, Model developers report.** USDOE Energy Information Administration, Washington, DC (United States). Energy Supply and Conversion Div. Feb 1995. 48p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014356. Source: OSTI; NTIS; GPO Dep.

The Office of Integrated Analysis and Forecasting (OIAF) is required to provide complete model documentation to meet the EIA Model Acceptance Standards. The Model Documentation for the Electricity Market Module (EMM) provides a complete description of the EMM methodology, structure, and relation to other modules in the National Energy Modeling System (NEMS). This Model Developers Report (MDR) serves as an appendix to the methodology documentation. The MDR provides an assessment of the sensitivity of the EMM results to changes in input data or parameters.

23732 (DOE/EIS–0182) **Energy planning and management program: Environmental impact statement.** USDOE Western Area Power Administration, Golden, CO (United States). [1995]. 310p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014997. Source: OSTI; NTIS; GPO Dep.

This environmental impact statement contains an analysis of the anticipated environmental impacts that would result from Western's proposed Energy Planning and Management Program. It contains a total of 13 alternatives, including a No-Action Alternative. All but the No-Action Alternative comprise different approaches to implementing the proposed Program. Except for the No-Action Alternative, relatively small distinctions were found in the impacts expected to result from the alternatives. However, there are important differences between the No-Action and other alternatives. The findings suggest that, in comparison with the No-Action Alternative, any of the Program Alternatives would result in fewer adverse environmental impacts over time. The analysis of economic impacts found that, in comparison to the No-Action Alternative, the Program Alternatives would be neutral or could improve regional economics. Western has established a Preferred Alternative that falls within the range of activities and impacts associated with the Program Alternatives. The Preferred Alternative is treated as a combination of Alternatives 5 and 6 and is not addressed separately.

23733 (ETDE-BR–0009) **Gradual addition planning of small-scale hydroelectric power plants to the generator park of a large scale electric power utility.** Demanboro, Antonio Carlos. Universidade Estadual de Campinas, SP (Brazil). Faculdade de Engenharia. 1990. 260p. (In Portugese). Order Number DE95789953. Source: OSTI; NTIS (US Sales Only).

A methodology for small-scale hydroelectric power plant installation in the interconnected concessionary, when the total capacity will be reduced in relation to the concessionary market is shown. The steps of this methodology are presented, according to the theoretical principles and the application criterion. A case report using this methodology is cited on detail. A forecast view of the Brazilian evolution for the several based elements in the electrical sector planning, as specified legislation, tariff system, market forecasts and plant projects optimization is also analyzed. 30 refs, 6 figs, 57 tabs

23734 (ETDE-BR–0015) **Criteria for determining the power supply among the electric power utilities.** Nasser, Ivana Costa. Universidade Estadual de Campinas, SP (Brazil). Faculdade de Engenharia Eletrica. Sep 1991. 101p. (In Portugese). Order Number DE95789959. Source: OSTI; NTIS (US Sales Only).

One of the objectives of the operation of an interconnected power system composed of several utilities is to determine energy and peak exchanges, in order to optimize the use of energy resources. In this way it is possible to provide a higher reliability to customers with lower costs. These exchanges are based on criteria which define the supply responsibility among the pooled participants. The supply responsibilities can be settled as firm contracts or temporary agreements. A new criterion for peak supply in a power pool is proposed, selected from seven alternative methods. In terms of methodology, six of the proposed criteria present a classical approach to the question, that is allocation of responsibilities. The seventh one, called 'direct determination of contracts', presents a different approach, characterizing the problem as a stochastic linear programming problem, solved by Monte Carlo Simulations and Benders Decomposition techniques. The results of an application are discussed The case study considers the south/southeast interconnected power system in Brazil, in its predicted configuration for December 1994. 35 refs, 14 figs, 23 tabs, 3 apps

23735 (ETDE-BR–0016) **Energetic parameters to be considered in the preparation of irrigation programs for the district of Santa Terezinha, Mato Grosso do Sul state, Brazil.** Alves, Claudio Benedito. UNESP, Botucatu, SP (Brazil). Faculdade de Ciencias Agronomicas. Dec 1990. 136p. (In Portugese). Order Number DE95789960. Source: OSTI; NTIS (US Sales Only).

In the elaboration of irrigation programs the characteristics of the region should be considered in order to identify the factors related to the local infrastructure, hydric resources and of the soils of the region and their interaction with the rural properties. Attention was given to the option between the use of electric power or diesel fuel in irrigation programs. The area studied was a hydro graphical micro basin in the district of Santa Terezinha, , Mato Grosso do Sul, Brazil. Rural properties with conditions to adopt techniques of irrigation and consumption of electric power were surveyed. Forms were used to collect data on: property and use of the land; knowledge of irrigation techniques and interest of the owner to be engaged in the program. The results show that 53.33% of them were interested in having their properties irrigated; 46.67% were not interested and 100% did not use irrigation techniques. Local conditions such as hydric resources and access to the power supply network were also evaluated. Factors that include the decision between the use of electric energy or diesel fuel in the irrigation program of the District of Santa Terezinha were studied. It was observed that the implantation of the irrigation program using electricity depends on the technical development of the electric power distribution system. For this region the resources to be invested in the irrigation system with 20, 50 and 75 HP diesel fuel motor are smaller when compared with electric power motors with the same potency. In 20 HP motors the expenses with electricity in irrigation systems are higher than the expenses with diesel fuel, and in 50 and 75 HP motors the expenses with diesel fuel are higher than the expenses with electricity. Considering the annual average expenses with energy, maintenance and depreciation of the equipment, the use of electric power limits to systems with 20 HP. (Abstract Truncated)

23736 (ETDE-DE–141) **Climate-compatible energy supply in Baden-Wuerttemberg. Electricity consumption of electronic data processing systems.** Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg. Arbeitsberichte, v. 7. Schulze, T. (Stuttgart Univ. (Germany). Inst. fuer Energiewirtschaft und Rationelle Energieanwendung (IER)); Fahl, U.; Voss, A. Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg, Stuttgart (Germany). Apr 1994. 58p. (In German). Order Number DE95790284. Source: OSTI; NTIS (US Sales Only).

First of all, the equipment currently used (computers, screens, printers, etc.) in the office as well as its purpose and its energy consumption are reviewed in the context of a technology description. In the case of computers, there is a significant difference between operation and utilisaton patterns. Here, utilisation patterns should be analyzed for the individual technologies if sufficient data are available. In addition, it should be investigated inhowfar operation patterns reflect actual needs. This is the first instance in which energy savings are possible by technical and behavioural measures. After this, the present stock of electronic data processing equipment and its future diffusion should be assessed. This, together with the results on utilisation and electricity consuption, is a precondition for determining the aggregated electricity demand of electronic data processing applications. The importance of innovations for the development of the electronic data processing market is stressed throughout the report. Selective simulation is cited as another measure for rational energy use.

23737 (ETDE-DE–157) **Pilot project for investigating electric power conservation in municipal buildings. Final report.** Rath, U. (comp.). Hessisches Ministerium fuer Umwelt, Energie und Bundesangelegenheiten, Wiesbaden (Germany); Ingenieurbuero fuer Energieberatung, Haustechnik und Oekologische Konzepte GbR (EBOEK), Tuebingen (Germany). Mar 1995. 138p. (In German). Order Number DE95790731. Source: OSTI; NTIS (US Sales Only).

In order to permit a rapid survey of the most important aspects of the study, a summary informs on the ideas behind this pilot project, the selection of objects analyzed, the method adopted for analyzing power consumption, and essential results. Furthermore, a brief valuation is formulated. - The detailed main part covers the following: Different aspects relevant to the project are highlighted in the introduction. The course of the pilot investigations is described. A separate chapter is dedicated to the method of analysis used, because its systematics is not generally known. Then the results are reported and discussed. Finally, conclusions are drawn. The annex contains numerous tables. (orig./UA)

23738 (INIS-mf–15116) **Vereinigte Elektrizitaetswerke Westfalen AG. Annual report 1994.** Vereinigte Elektrizitaetswerke Westfalen AG (VEW), Dortmund (Germany). 1995. 96p. (In German). Order Number DE95790214. Source: OSTI; NTIS (US Sales Only); INIS.

The tasks and activities of this German electric utility are described. The annual report for 1994 contains a large number of financial data (e.g. balance sheet, profit- and -loss account, etc.). (UA)

23739 (DOE/EIA–0035(95/06)) **Monthly energy review, June 1995.** USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use. Jun 1995. 174p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014485. Source: OSTI; NTIS; GPO; GPO Dep.

This is the June report by the Energy Information Administration. The contents of the report include an energy overview, energy consumption, petroleum, natural gas, oil and gas resource development, coal, electricity, nuclear energy, energy prices, and international energy. Included are appendices containing thermal conversion factors, metric and other physical conversion factors, and carbon dioxide emission factors for coal.

23740 (DOE/EIA–0214(93)) **State energy data report 1993: Consumption estimates.** USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use. Jul 1995. 518p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95015164. Source: OSTI; NTIS; GPO Dep.

The State Energy Data Report (SEDR) provides annual time series estimates of State-level energy consumption by major economic sector. The estimates are developed in the State Energy Data System (SEDS), which is maintained and operated by the Energy Information Administration (EIA). The goal in maintaining SEDS is to create historical time series of energy consumption by State that are defined as consistently as possible over time and across sectors. SEDS exists for two principal reasons: (1) to provide State energy consumption estimates to Members of Congress, Federal and State agencies, and the general public; and (2) to provide the historical series necessary for EIA's energy models.

23741 (ENEA-RT-ERG–95-02) **Some conditions for significant contribution from photovoltaics to sustainable development.** Coiante, D. (ENEA, Casaccia (Italy). Area Energia e Innovazione). ENEA, Casaccia (Italy). Area Energia e Innovazione. Mar 1994. 20p. Order Number DE95789773. Source: OSTI; NTIS (US Sales Only).

In medium-long term perspective, the anthropogenic atmospheric pollution, due to fossil fuel burning, could be contained by massively using of renewable energy. Significant improvements are expected to arise from diffusion into use of large scale PV power systems. Considering the situation in Italy as a typical study case, a limit can be individuated, which makes that PV contribution to annual electric energy balance can reach a maximum of about 7%. Such a figure corresponds to about 2% in terms of contribution to total energy balance. Thus, the intermittent energy sources are destined, in Italy, to be confined to a role, just significant (7%) in the electric energy sector, but quite marginal (2%) with reference to expected environmental massive benefits. Apart from numerical results, this disappointing concept can be applied in general to all OCSE countries, which globally produce the largest amount of world pollutant energy. Consequently, if photovoltaics wants to acquire a real environmental consistence, the limit of PV system diffusion has to be overcome. This can be attained by implementing the present grid-tied reference model for PV system diffusion by including an hydrogen production and storage system.

30 DIRECT ENERGY CONVERSION

3001 MHD Generators

23742 (DOE/PC/79669–T3) **Conceptual design of a coal-fired MHD retrofit. Final technical report.** MHD Development Corp., Butte, MT (United States). Jun 1994. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-87PC79669. Order Number DE95015540. Source: OSTI; NTIS; GPO Dep.

Coal-fired magnetohydrodynamics (MHD) technology is ready for its next level of development - an integrated demonstration at a commercial scale. The development and testing of MHD has shown its potential to be the most efficient, least costly, and cleanest way to burn coal. Test results have verified a greater than 99% removal of sulphur with a potential for greater than 60% efficiency. This development and testing, primarily funded by the U.S. Department of Energy (DOE), has progressed through the completion of its proof-of-concept (POC) phase at the 50 MWt Component Development and Integration Facility (CDIF) and 28 MWt Coal Fired Flow Facility (CFFF), thereby, providing the basis for demonstration and further commercial development and application of the technology. The conceptual design of a retrofit coal-fired MHD generating plant was originally completed by the MHD Development Corporation (MDC) under this Contract, DE-AC22-87PC79669. Thereafter, this concept was updated and changed to a stand-alone MHD demonstration facility and submitted by MDC to DOE in response to the fifth round of solicitations for Clean Coal Technology. Although not selected, that activity represents the major interest in commercialization by the developing industry and the type of demonstration that would be eventually necessary. This report updates the original executive summary of the conceptual design by incorporating the results of the POC program as well as MDC's proposed Billings MHD Demonstration Project (BMDP) and outlines the steps necessary for commercialization.

3003 Thermoelectric Generators

23743 (DOE/SF/17905–T10) **Thermoelectric material development. Quarterly technical progress report, January 1, 1995–March 31, 1995.** Vandersande, J.W.; Caillat, T. Jet Propulsion Lab., Pasadena, CA (United States). [1995]. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI02-89SF17905. Order Number DE95014298. Source: OSTI; NTIS; GPO Dep.

We have found that there is a limited range of solid solutions between the skutterudite compounds $CoSb_3$ and $RuSb_2Te$ (about 5% on each side). For the system $(RuSb_2Te)_x(CoSb_3)_{1-x}$, preliminary results obtained on one n-type sample on the $CoSb_3$-rich side show that these alloys have good thermoelectric properties and a maximum ZT of about 0.89 was obtained at about 600 C. More experiments will be started to investigate the possibility of a broader range of miscibility in this system which would allow an even further decrease in the lattice thermal conductivity, resulting in better thermoelectric properties. $IrSb_3$ and $RuSb_2Te$ form a complete range of solid solutions. Hot-pressed samples in this system have shown p-type conductivity. The thermoelectric properties of these p-type alloys have been measured and results have shown that their potential for thermoelectric applications is limited mainly because of the relatively low Seebeck coefficient values for p-type materials. Efforts will be directed on preparing n-type samples of the same alloys by doping with various dopants such as Ni and Pd.

3005 Fuel Cells

23744 (ANL–94/46) **European Fuel Cells R&D Review. Final report, Purchase Order No. 062014.** Michael, P.D. (Energy Technology Support Unit, Harwell (United Kingdom)); Maguire, J. Argonne National Lab., IL (United States); Energy Technology Support Unit, Harwell (United Kingdom). Sep 1994. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95014509. Source: OSTI; NTIS; GPO Dep.

Aim of the Review is to present a statement on the status of fuel cell development in Europe, addressing the research, development and demonstration (RD&D) and commercialization activities being undertaken, identifying key European organizations active in development and commercialization of fuel cells and detailing their future plans. This document describes the RD&D activities in Europe on alkaline, phosphoric acid, polymer electrolyte, direct methanol, solid oxide, and molten carbonate fuel cell types. It describes the European Commission's activities, its role in the European development of fuel cells, and its interaction with the national programs. It then presents a country-by-country breakdown. For each country, an overview is given, presented by fuel cell type. Scandinavian countries are covered in less detail. American organizations active in Europe, either in supplying fuel cell components, or in collaboration, are identified. Applications include transportation and cogeneration.

23745 (ANL/CMT/CP–85790) **Fuel cell systems for first lunar outpost – Reactant storage options.** Nelson, P.A. (Argonne National Lab., IL (United States). Chemical Technology Div.). Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9505226–1: 4. space electrochemical research

and technology conference, Cleveland, OH (United States), 2-3 May 1995). Order Number DE95013408. Source: OSTI; NTIS; GPO Dep.

A Lunar Surface Power Working Group was formed to review candidate systems for providing power to the First Lunar Outpost habitat. The working group met for five days in the fall of 1992 and concluded that the most attractive candidate included a photovoltaic unit, a fuel cell, a regenerator to recycle the reactants, and storage of oxygen and hydrogen gases. Most of the volume (97%) and weight (64%) are taken up by the reactants and their storage tanks. The large volume is difficult to accommodate, and therefore, the working group explored ways of reducing the volume. An alternative approach to providing separate high pressure storage tanks is to use two of the descent stage propellant storage tanks, which would have to be wrapped with graphite fibers to increase their pressure capability. This saves 90% of the volume required for storage of fuel cell reactants. Another approach is to use the descent storage propellant tanks for storage of the fuel cell reactants as cryogenic liquids, but this requires a gas liquefaction system, increases the solar array by 40%, and increases the heat rejection rate by 170% compared with storage of reactants as high pressure gases. For a high power system (>20 kW) the larger energy storage requirement would probably favor the cryogenic storage option.

23746 (LA-UR–95-1351) **Through-the-electrode model of a proton exchange membrane fuel cell with independently measured parameters.** Weisbrod, K.R.; Grot, S.A.; Vanderborgh, N.E. Los Alamos National Lab., NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-951007–2: 188. meeting of the Electrochemical Society, Chicago, IL (United States), 8-13 Oct 1995). Order Number DE95012063. Source: OSTI; NTIS; GPO Dep.

A one dimensional model for a proton exchange membrane fuel cell was developed which makes use of independently measured parameters for predicting single cell performance. Optimization of catalyst layer formulation and properties are explored. Impact of temperature and cathode pressure upon system performance was investigated.

23747 (LA-UR–95-1352) **Characterization of PEM fuel cell membrane-electrode-assemblies by electrochemical methods and microanalysis.** Borup, R.L.; Vanderborgh, N.E. Los Alamos National Lab., NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-951007–1: 188. meeting of the Electrochemical Society, Chicago, IL (United States), 8-13 Oct 1995). Order Number DE95012064. Source: OSTI; NTIS; GPO Dep.

Hydrogen adsorption/desorption and CO oxidation are used to evaluate the active Pt surface area of fuel cell membrane electrode assemblies. The membrane electrode assemblies are evaluated for useful catalyst life and are examined for relative CO and CO_2 tolerance. The electrochemical measurements combined with microanalysis of membrane electrode assemblies, including SEM and EDS allow a greater understanding and optimization of process variables.

32 ENERGY CONSERVATION, CONSUMPTION, AND UTILIZATION

3201 Buildings

23748 (DOE/EE–0064) **Technical support document: Energy efficiency standards for consumer products: Refrigerators, refrigerator-freezers, and freezers including draft environmental assessment, regulatory impact analysis.** USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). Office of Codes and Standards. Jul 1995. 416p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95015578. Source: OSTI; NTIS; GPO Dep.

The Energy Policy and Conservation Act (P.L. 94-163), as amended by the National Appliance Energy Conservation Act of 1987 (P.L. 100-12) and by the National Appliance Energy Conservation Amendments of 1988 (P.L. 100-357), and by the Energy Policy Act of 1992 (P.L. 102-486), provides energy conservation standards for 12 of the 13 types of consumer products' covered by the Act, and authorizes the Secretary of Energy to prescribe amended or new energy standards for each type (or class) of covered product. The assessment of the proposed standards for refrigerators, refrigerator-freezers, and freezers presented in this document is designed to evaluate their economic impacts according to the criteria in the Act. It includes an engineering analysis of the cost and performance of design options to improve the efficiency of the products; forecasts of the number and average efficiency of products sold, the amount of energy the products will consume, and their prices and operating expenses; a determination of change in investment, revenues, and costs to manufacturers of the products; a calculation of the costs and benefits to consumers, electric utilities, and the nation as a whole; and an assessment of the environmental impacts of the proposed standards.

23749 (DOE/EE–0066) **Partnerships for technology introduction – Putting the technologies of tomorrow into the marketplace of today. Report to Congress on Sections 127 and 128 of the Energy Policy Act of 1992.** USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). Building Equipment Div. Apr 1995. 28p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95016234. Source: OSTI; NTIS; GPO Dep.

This report to Congress was prepared on behalf of the Secretary of the US Department of Energy (DOE) in response to Sections 127 and 128 of the Energy Policy Act of 1992 (EPAct), Pub. L. 102-486. In preparing the report to the Congress, DOE has assessed the national and regional energy savings potential of products already on the market and those that will be available to consumers by the late 1990s. The Department has also examined the present cost-effectiveness of these emerging appliances as mature technologies. To help in its assessment, DOE organized eight workshops at which representatives from manufacturing and building industries, utilities, retailers and wholesalers, public interest groups and Federal and state government agencies could express their views. The information derived from these workshops was key to the formulation of the report's general and specific recommendations. DOE has concluded that the Federal Government can effectively stimulate the market for emerging technologies by forming partnerships with the appliance industry and other interested parties promoting the use of highly efficient appliances. Based on the interaction with industry at the eight workshops and through direct contact, DOE has concluded that Federal action and technical assistance is not only desired by industry, but crucial to the expansion of these markets. Section 128 of EPAct requires an assessment of the energy savings and environmental benefits of replacing older, less efficient appliances with more efficient products than currently required by Federal law. Since early replacement of appliances is but one possible market-stimulating action, DOE has elected to include its discussion as part of the overall report to the Congress.

23750 (DOE/EIA–0314(93)) **Housing characteristics 1993.** USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use. Jun 1995. 355p. Sponsored by USDOE, Washington, DC (United States). US Department of Health and Human Services; USDOE Office of Mino Order Number DE95014557. Source: OSTI; NTIS; GPO Dep.

This report, Housing Characteristics 1993, presents statistics about the energy-related characteristics of US households. These data were collected in the 1993 Residential Energy Consumption Survey (RECS) – the ninth in a series of nationwide energy consumption surveys conducted since 1978 by the Energy Information Administration of the US Department of Energy. Over 7 thousand households were surveyed, representing 97 million households nationwide. A second report, to be released in late 1995, will present statistics on residential energy consumption and expenditures.

23751 (DOE/GO/10044–1) **The harmonization of Canadian and U.S. window programs and standards. Final report.** Enermodal Engineering, Inc., Denver, CO (United States). 31 May 1995. 192p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG36-94GO10044. Order Number DE95015479. Source: OSTI; NTIS; GPO Dep.

The window and door industry in North America have a strong interest in harmonizing US and Canadian rating procedures and standards for predicting the thermal performance of their products. The costs and time associated with complying with the requirements in both countries are significant and could be reduced through reciprocity. The purpose of this paper is to compare the US and Canadian rating programs. Joint efforts between the US and Canada can use this information to focus on reconciling the differences and to work towards reciprocity. The following identifies the applicable procedures and standards for both countries, and summarizes the major differences in the products that are covered, the sizes that are used, the U-factor and solar heat gain coefficient calculational and test methods, air leakage measurement, prediction of annual energy use, condensation resistance methods, reporting requirements, and accreditation and certification programs. The major differences between the system s are identified and recommendations are made to achieve reciprocity. The appendix contains a paper that is a synopsis of the findings from this study.

23752 (DOE/ID/13052–1) **New industrial heat pump applications to a synthetic rubber plant. Final report, Phase IIA.** TENSA Services, Houston, TX (United States). 1993. 97p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC02-91ID13052. Order Number DE95015481. Source: OSTI; NTIS; GPO Dep.

This report summarizes the results of the Phase IIA of the DOE sponsored study titled, Advanced Industrial Heat Pump Application and Evaluation. The scope of this phase of the study was to finalize the process design of the heat pump scheme, develop a process and instrumentation diagram, and a detailed cost estimate for the project. This information is essential for the site management to evaluate the economic viability and operability of the proposed heat pump design, prior to the next phase of installation and testing.

23753 (DOE/R2/15469–T8) **The recuperator of flue gas heat. Final report.** Thermecon, Champlain, NY (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG42-93R215469. Order Number DE95015458. Source: OSTI; NTIS; GPO Dep.

The performance of a recuperator with respect to lowering the exiting temperature of flue gas has been evaluated. The recuperator lowered the flue gas temperature and increased the output heating capacity, thereby increasing the efficiency of fuel utilization. The recuperator could improve the efficiency of older, existing furnaces.

23754 (DOE/R4/10610–T1) **Energy efficient affordable housing. Final report.** Southface Energy Inst., Inc., Atlanta, GA (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG44-93R410610. Order Number DE95015454. Source: OSTI; NTIS; GPO Dep.

In 1994, the Southface Energy Institute, working with support from US DOE, initiated a program to provide technical assistance to nonprofit organizations developing affordable housing in the Olympic target communities of Atlanta. The specific project goals were: Identify the barriers that nonprofit affordable housing providers face in increasing the energy and resource efficiency of affordable housing; Assist them in developing the resources to overcome these barriers; Develop specific technical materials and program models that will enable these affordable housing groups to continue to improve the energy efficiency of their programs; and, To transfer the program materials to other affordable housing providers. This report summarizes the progress made in each of these areas.

23755 (ETDE-DE–150) **Development of novel dynamic latent heat storage processes.** Biedermann, A. HLB Institut fuer Heizung, Lueftung und Bautechnik, Berlin (Germany). Jan 1995. 106p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0329219A. Order Number DE95790709. Source: OSTI; NTIS (US Sales Only).

The report describes novel, efficient latent heat storage systems with high energy densities. The storage systems will be used in the space and water heating sector. The investigations comprised two fields of emphasis, i.e. temperatures of 50-80 C and 110-130 C. Further chapters discuss economic aspects and potential applications. (HW)

23756 (ETDE-DE–164) **Climate-compatible energy supply in Baden-Wuerttemberg. Potential energy savings in the building construction sector in Baden-Wuerttemberg.** Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg. Arbeitsberichte, v. 8. Gierga, M. (Fraunhofer-Institut fuer Bauphysik, Stuttgart (Germany)); Erhorn, H. Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg, Stuttgart (Germany). Apr 1994. 79p. (In German). Order Number DE95790281. Source: OSTI; NTIS (US Sales Only).

This brochure is part of the progress reports of the "Academy for Technology Assessment in Baden-Wuerttemberg". It reviews the project "Climate-compatible energy supply in Baden-Wuerttemberg". Options for a restructuring of the energy supply and energy consumption systems are analyzed with the goal of a 25-30% reduction of CO_2 emissions by the year 2005. Contents: State of the art; Technical potential; Energy consumption; Potential energy savings; Investment cost. (orig.)

23757 (ETDE-DE–168) **Thermal insulation materials for buildings. Catalogue of standardized products accepted by the building authorities.** Sauerbrunn, I. Gesamtverband Daemmstoffindustrie (GDI), Hamburg (Germany). [1995]. 28p. (In German). Order Number DE95790560. Source: OSTI; NTIS (US Sales Only).

The brochure lists standardized products for thermal insulation of buildings which have been accepted by the building authorities. Contents: Standards for thermal insulation of buildings; application types; organic insulating materials; inorganic insulating materials; properties of insulating materials; labelling; quality assurance and monitoring. (orig.)

23758 (NYSERDA–95-10) **Office technology energy use and savings potential in New York. Final report.** New York State Energy Research and Development Authority, Albany, NY (United States); Lawrence Berkeley Lab., CA (United States). Jun 1995. 90p. Sponsored by New York State Energy Research and Development Authority, Albany, NY (United States). Source: OSTI; New York State Energy Research and Development Authority, Two Rockefeller Plaza, Albany, NY 12223 (United States).

This report discusses energy use by office equipment in New York State and the energy savings potential of energy-efficient equipment. A model containing equipment densities and energy-use characteristics for major categories of office equipment has been developed. The model specifies power requirements and hours of use for three modes of average operation for each device: active, standby, and suspend. The energy-use intensity for each device is expressed as a function of the average device density (number of units/1,000 sq ft), the hours of operation in each mode, and the average power requirements in each mode. Output includes an estimate of total energy use (GWh) for each device by building type. Three scenarios are developed. First is a business-as-usual efficiency baseline. Second is a future with increased use of power-managed devices projected under the current Energy Star Computers program sponsored by the US EPA. Third is a scenario that examines energy savings from greater use of products that go well beyond the standard Energy Star products. A series of sensitivity analyses were conducted to explore uncertainties in model inputs. The business-as-usual baseline forecast confirms that office equipment energy use has been rising over the past decade, and may continue to increase for the next decade and beyond. Office equipment currently consumes about 2,900 GWh/year in the State of New York. Under the business-as-usual baseline forecast, this load may increase to 3,300 GWh/year by the year 2000, and approximately double again before 2010. Widespread use of power management technologies adopted with the promotion of the Energy Star program could reduce this load growth by about 30% by the year 2000. Use of more advanced energy-efficient technology

could reduce total energy use by office equipment to about 1,900 GWh/year in 2010, which is less than current consumption.

23759 (ORNL/CON–412) **Evaluating the income and employment impacts of gas cooling technologies.** Hughes, P.J. (Oak Ridge National Lab., TN (United States)); Laitner, S. Oak Ridge National Lab., TN (United States). Mar 1995. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95012543. Source: OSTI; NTIS; GPO Dep.

The purpose of this study is to estimate the potential employment and income benefits of the emerging market for gas cooling products. The emphasis here is on exports because that is the major opportunity for the U.S. heating, ventilating, and air-conditioning (HVAC) industry. But domestic markets are also important and considered here because without a significant domestic market, it is unlikely that the plant investments, jobs, and income associated with gas cooling exports would be retained within the United States. The prospects for significant gas cooling exports appear promising for a variety of reasons. There is an expanding need for cooling in the developing world, natural gas is widely available, electric infrastructures are over-stressed in many areas, and the cost of building new gas infrastructure is modest compared to the cost of new electric infrastructure. Global gas cooling competition is currently limited, with Japanese and U.S. companies, and their foreign business partners, the only product sources. U.S. manufacturers of HVAC products are well positioned to compete globally, and are already one of the faster growing goods-exporting sectors of the U.S. economy. Net HVAC exports grew by over 800 percent from 1987 to 1992 and currently exceed $2.6 billion annually (ARI 1994). Net gas cooling job and income creation are estimated using an economic input-output model to compare a reference case to a gas cooling scenario. The reference case reflects current policies, practices, and trends with respect to conventional electric cooling technologies. The gas cooling scenario examines the impact of accelerated use of natural gas cooling technologies here and abroad.

23760 (ORNL/SUB–91-SH225) **Technology assessment of external heat systems for Stirling heat pumps. Final report.** Vasilakis, A.D. (Advanced Mechanical Technology, Inc., Newton, MA (United States)). Oak Ridge National Lab., TN (United States); Advanced Mechanical Technology, Inc., Newton, MA (United States). Dec 1993. 101p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95011624. Source: OSTI; NTIS; GPO Dep.

A technology assessment and design improvement effort was undertaken for the Stirling engine heat pump external heat system (EHS) in order to reduce costs. It was found that only two applicable EHS design approaches have been developed to any extent: a relatively undeveloped design featuring a premixed fuel and air transpiration burner, and a turbulent diffusion type burner system developed by Mechanical Technology, Inc. To evaluate and optimize the design concepts, an analytical model was developed that examined design and performance variables. The model calculated key temperatures, allowing the specification of materials requirements. Adherence to American National Standards Institute appliance furnace code material specifications was assumed. Concepts for EHS control systems were evaluated, and a cost-effective control system design was developed for the turbulent diffusion burner EHS. The study reveals that optimizing the diffusion burner EHS design can result in significant cost savings. No clear choice between the diffusion burner and transpiration burner systems could be determined from this study, but the designs of both were further developed and improved. Estimates show the EHS based on a transpiration burner to have a manufactured cost that is roughly 70% of the turbulent diffusion burner EHS cost, but fuel efficiency is lower by about 18%.

23761 (PNL–10541) **FORSCOM installation characterization and ranking for water efficiency improvement.** Fitzpatrick, Q.K. (and others); McMordie, K.L.; Di Massa, F.V. Pacific Northwest Lab., Richland, WA (United States). May 1995. 127p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95015135. Source: OSTI; NTIS; GPO Dep.

On March 11, 1994, President Clinton signed Executive Order 12902-Energy Efficiency and Water Conservation at Federal Facilities. Section 302 of the Executive Order calls for energy and water prioritization surveys of federal facilities to be conducted. The surveys will be used to establish priorities for conducting comprehensive facility audits. In response to the requirements of the Executive Order, the U.S. Army Forces Command (FORSCOM) has tasked Pacific Northwest Laboratory (PNL) to initiate a broad study of the water savings potential at each of its major installations. This report provides an assessment of the water, sewer, energy (for hot water production and pumping), and associated cost savings potential at ten of the major FORSCOM installations. This assessment is meant to be a "first pass" estimate of the water savings potential, to assist FORSCOM in prioritizing installations for detailed water audits and potential water efficient retrofits. In addition, the end uses (toilets, sinks, showerheads, irrigation, etc.) with the greatest water savings potential are identified at each installation. This report is organized in the following manner. Following this Introduction, Section 2 provides important background information pertaining to the water analysis. Section 3 describes the methodology employed in the analysis, and Section 4 summarizes the study results. Section 5 prioritizes the installations based on both water/sewer savings and cost associated with water, sewer, and energy savings. Section 6 provides recommendations on where to start detailed water audits, as well as other recommendations. References are listed in Section 7. The appendices provide specific information on the analysis results and methodology, along with a discussion of special issues.

23762 (PNL-SA–26005) **Maintaining the solution to operations and maintenance efficiency improvement.** Meador, R.J. Pacific Northwest Lab., Richland, WA (United States). May 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950564–10: 9. symposium on power plant dynamics, control and testing, Knoxville, TN (United States), 24-26 May 1995). Order Number DE95014610. Source: OSTI; NTIS; GPO Dep.

This paper discusses the emergence of a new, necessary philosophy for the successful implementation of advanced technologies to improve plant performance and longevity. Thus philosophy is necessary to ensure the expected return on the initial capital investment is realized. This paper defines the elements of an Operations and Maintenance (O&M) methodology that utilizes a holistic approach which considers all aspects of the supporting infrastructure (Operations, Maintenance, Engineering, Training, and Administration) as integral parts of the whole system. This paper also discusses a network structure that provides an intelligent integrated plant communication network for the measurement and management of plant performance goals.

23763 (ANL/RA/CP–85716) **Large-scale Intelligent Transporation Systems simulation.** Ewing, T.; Canfield, T.; Hannebutte, U.; Levine, D.; Tentner, A. Argonne National Lab., IL (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950439–13: SMS simulation multiconference: simulation as a critical technology, Phoenix, AZ (United States), 9-13 Apr 1995). Order Number DE95012268. Source: OSTI; NTIS; GPO Dep.

A prototype computer system has been developed which defines a high-level architecture for a large-scale, comprehensive, scalable simulation of an Intelligent Transportation System (ITS) capable of running on massively parallel computers and distributed (networked) computer systems. The prototype includes the modelling of instrumented "smart" vehicles with in-vehicle navigation units capable of optimal route planning and Traffic Management Centers (TMC). The TMC has probe vehicle tracking capabilities (display position and attributes of instrumented vehicles), and can provide 2-way interaction with traffic to provide advisories and link times. Both the in-vehicle navigation module and the TMC feature detailed graphical user interfaces to support human-factors studies.

The prototype has been developed on a distributed system of networked UNIX computers but is designed to run on ANL's IBM SP-X parallel computer system for large scale problems. A novel feature of our design is that vehicles will be represented by autonomus computer processes, each with a behavior model which performs independent route selection and reacts to external traffic events much like real vehicles. With this approach, one will be able to take advantage of emerging massively parallel processor (MPP) systems.

23764 (CONF-950193–2) **A restricted branch and bound approach for setting the left turn phase sequences in signalized networks.** Pillai, R.S. (Oak Ridge National Lab., TN (United States)); Rathi, A.K.; Cohen, S. Oak Ridge National Lab., TN (United States). Jul 1994. 19p. Sponsored by Federal Highway Administration, Washington, DC (United States). DOE Contract AC05-84OR21400. From 74. annual transportation research board meeting; Washington, DC (United States); 11-15 Jan 1995. Order Number DE95014286. Source: OSTI; NTIS; GPO Dep.

The main objective of synchronized signal timing is to keep traffic moving along arterial in platoons throughout the signal system by proper setting of left turn phase sequence at signals along the arterials/networks. The synchronization of traffic signals located along the urban/suburban arterials in metropolitan areas is perhaps one of the most cost-effective method for improving traffic flow along these streets. The popular technique for solving this problem formulates it as a mixed integer linear program and used Land and Powell branch and bound search to arrive at the optimal solution. The computation time tends to be excessive for realistic multiarterial network problems due to the exhaustive nature of the branch and bound search technique. Furthermore, the Land and Powell branch and bound code is known to be numerically unstable, which results in suboptimal solutions for network problems with a range on the cycle time variable. This paper presents the development of a fast and numerically stable heuristic, developed using MINOS linear programming solver. The new heuristic can generate optimal/near-optimal solutions in a fraction of the time needed to compute the optimal solution by Land and Powell code. The solution technique is based on restricted search using branch and bound technique. The efficiency of the heuristic approach is demonstrated by numerical results for a set of test problems.

23765 (CONF-9504177–1) **Panama Canal capacity analysis.** Bronzini, M.S. (Oak Ridge National Lab., Knoxville, TN (United States). Center for Transportation Analysis). Oak Ridge National Lab., TN (United States). 27 Apr 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From The new Panama Canal: another path between the seas; New York, NY (United States); 27 Apr 1995. Order Number DE95013993. Source: OSTI; NTIS; GPO Dep.

Predicting the transit capacities of the various Panama Canal alternatives required analyzing data on present Canal operations, adapting and extending an existing computer simulation model, performing simulation runs for each of the alternatives, and using the simulation model outputs to develop capacity estimates. These activities are summarized in this paper. A more complete account may be found in the project final report (TAMS 1993). Some of the material in this paper also appeared in a previously published paper (Rosselli, Bronzini, and Weekly 1994).

23766 (ETDE-DE–167) **Climate-compatible energy supply in Baden-Wuerttemberg. Energy savings and CO_2 reduction in transportation - how to reduce private transportation, induce people to use environment-friendly means of transportation, and enhance the network capacity.** Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg. Arbeitsberichte, v. 20. Steierwald, G. (Stuttgart Univ. (Germany). Inst. fuer Strassen- und Verkehrswesen); Flasche, B.; Kolb, A.; Lampatzer, R.; Moergenthaler, U.; Vogt, W. Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg, Stuttgart (Germany). Apr 1994. 130p. (In German). Order Number DE95790272. Source: OSTI; NTIS (US Sales Only).

This brochure is one of the progress reports of the "Academy for Technology Assessment in Baden-Wuerttemberg". Expert's opinion No.15, "Energy conservation and CO_2 reduction in transportation - how to reduce private transportation, induce people to use environment-friendly means of transportation, and enhance the network capacity" investigated strategies and measures for reducing energy consumption and CO_2 emissions on the transportation sector; the report contains 15 studies on the following subjects: How to reduce the number of motor cars on the roads; How to induce people to use less polluting means of transportation; How to enhance the network frequency. (HW)

23767 (LA-UR–95-1641) **TRANSIMS: Transportation analysis and simulation system.** Smith, L. (and others); Beckman, R.; Baggerly, K. Los Alamos National Lab., NM (United States). [1995]. 10p. Sponsored by Department of Transportation, Washington, DC (United States);Environmental Protection Agency, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95015335. Source: OSTI; NTIS; GPO Dep.

This document summarizes the TRansportation ANalysis and SIMulation System (TRANSIMS) Project, the system's major modules, and the project's near-term plans. TRANSIMS will employ advanced computational and analytical techniques to create an integrated regional transportation systems analysis environment. The simulation environment will include a regional population of individual travelers and freight loads with travel activities and plans, whose individual interactions will be simulated on the transportation system, and whose environmental impact will be determined. We will develop an interim operational capability (IOC) for each major TRANSIMS module during the five-year program. When the IOC is ready, we will complete a specific case study to confirm the IOC features, applicability, and readiness.

23768 (SAND–94-2328/2) **Research methods to develop Measures of Effectiveness of the United States Coast Guard's Vessel Inspection and Boarding Program. Volume 2, Main report.** Wheeler, T. (Sandia National Labs., Albuquerque, NM (United States)); Cox, R.; Gawande, K.; Stone, R.; Waisel, L.; Wallace, W.A. Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 657p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95014528. Source: OSTI; NTIS; GPO Dep.

The primary objective of this study is to provide Measures of Effectiveness (MOEs) of the US Coast Guard Marine Inspection and Boarding Program based on objective scientific methods. A secondary objective of the study is to provide USCG management with a methodologically and theoretically sound aid to effective policy decision-making. The MOEs constructed in this study are specific to the Marine Inspection and Boarding Program, but the methodology of the study is based on sound theoretical principles that are probably applicable to a range of USCG activities. Hence the methodology applied equally to other important USCG programs and can be similarly used to measure their effectiveness and as an aid to decision-making.

23769 (SAND–95-0867) **The state-of-the-art port of entry workshop.** Godfrey, B. Sandia National Labs., Albuquerque, NM (United States). May 1995. 85p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9407186–Exec.Summ.: State-of-the-art port of entry workshop, Albuquerque, NM (United States), 14-15 Jul 1994). Order Number DE95013558. Source: OSTI; NTIS; GPO Dep.

The increased demand for freight movements through international ports of entry and the signing of the North American Free Trade Agreement (NAFTA) have increased freight traffic at border ports of entry. The State-of-the-Art Port of Entry Workshop initiated a dialogue among technologists and stakeholders to explore the potential uses of technology at border crossings and to set development priorities. International ports of entry are both information and labor intensive, and there are many promising technologies that could be used to provide timely information and optimize inspection resources. Participants universally held that integration of technologies and operations is critical to improving port services. A series of Next Steps was developed to address stakeholder issues and national priorities, such as the National Transportation Policy and National Drug Policy. This report documents the views of the various stakeholders and technologists present at the workshop and outlines future directions of study.

23770 (SAND–95-1268) **The pulsed linear induction motor concept for high-speed trains.** Turman, B.N.; Marder, B.M.; Rohwein, G.J.; Aeschliman, D.P.; Kelley, J.B.; Cowan, M.; Zimmerman, R.M. Sandia National Labs., Albuquerque, NM (United States). Jun 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95014531. Source: OSTI; NTIS; GPO Dep.

The SERAPBIM (SEgmented RAil PHased Induction Motor) concept is a linear induction motor concept which uses rapidly-pulsed magnetic fields and a segmented reaction rail, as opposed to low-frequency fields and continuous reaction rails found in conventional linear induction motors. These improvements give a high-traction, compact, and efficient linear motor that has potential for advanced high speed rail propulsion. In the SERAPBIM concept, coils on the vehicle push against a segmented aluminum rail, which is mounted on the road bed. Current is pulsed as the coils cross an edge of the segmented rail, inducing surface currents which repel the coil. The coils must be pulsed in synchronization with the movement by reaction rail segments. This is provided by a sense-and-fire circuit that controls the pulsing of the power modulators. Experiments were conducted to demonstrate the feasibility of the pulsed induction motor and to collect data that could be used for scaling calculations. A 14.4 kg aluminum plate was accelerated down a 4 m track to speeds of over 15 m/sec with peak thrust up to 18 kN per coilset. For a trainset capable of 200 mph speed, the SERAPHIM concept design is based on coils which are each capable of producing up to 3.5 kN thrust, and 30 coil pairs are mounted on each power car. Two power cars, one at each end of the train, provide 6 MW from two gas turbine prime power units. The thrust is about 210.000 N and is essentially constant up to 200 km/hr since wheel slippage does not limit thrust as with conventional wheeled propulsion. A key component of the SERAPHIM concept is the use of passive wheel-on-rah support for the high speed vehicle. Standard steel wheels are capable of handling over 200 mph. The SERAPHIM cost is comparable to that for steel-wheel high-speed rail, and about 10% to 25% of the projected costs for a comparable Maglev system.

23771 (UCRL-ID–121357) **Analysis of automated highway system risks and uncertainties. Volume 5.** Sicherman, A. Lawrence Livermore National Lab., CA (United States). Oct 1994. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015595. Source: OSTI; NTIS; GPO Dep.

This volume describes a risk analysis performed to help identify important Automated Highway System (AHS) deployment uncertainties and quantify their effect on costs and benefits for a range of AHS deployment scenarios. The analysis identified a suite of key factors affecting vehicle and roadway costs, capacities and market penetrations for alternative AHS deployment scenarios. A systematic protocol was utilized for obtaining expert judgments of key factor uncertainties in the form of subjective probability percentile assessments. Based on these assessments, probability distributions on vehicle and roadway costs, capacity and market penetration were developed for the different scenarios. The cost/benefit risk methodology and analysis provide insights by showing how uncertainties in key factors translate into uncertainties in summary cost/benefit indices.

Hazardous waste control activities in Asia and the Pacific have been reviewed. The review includes China (mainland, Hong Kong, and Taiwan), Indonesia, Korea, Malaysia, Papua New Guinea, the Philippines, Singapore, and Thailand. It covers the sources of hazardous waste, the government structure for dealing with hazardous waste, and current hazardous waste control activities in each country. In addition, the hazardous waste program activities of US government agencies, US private-sector organizations, and international organizations are reviewed. The objective of these reviews is to provide a comprehensive picture of the current hazardous waste problems and the waste management approaches being used to address them so that new program activities can be designed more efficiently.

23773 (ANL/ES/CP–82597) **Recycling zinc by dezincing steel scrap.** Dudek, F.J. (Argonne National Lab., IL (United States)); Daniels, E.J.; Morgan, W.A. Argonne National Lab., IL (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9505131–1: International symposium on the extraction and applications of zinc and lead, Sendai (Japan), 22-24 May 1995). Order Number DE95013469. Source: OSTI; NTIS; GPO Dep.

In response to the worldwide increase in consumption of galvanized steel for automobiles in the last fifteen years, and the increased cost of environmental compliance associated with remelting larger quantities of galvanized steel scrap, a process is being developed to separate and recover the steel and zinc from galvanized ferrous scrap. The zinc is dissolved from the scrap in hot caustic using anodic assistance and is recovered electrolytically as dendritic powder. The designed ferrous scrap is rinsed and used directly. The process is effective for zinc, lead, and aluminum removal on loose and baled scrap and on all types of galvanized steel. The process has been pilot tested in Hamilton, Ontario for batch treatment of 900 tonnes of mostly baled scrap. A pilot plant in East Chicago, Indiana has designed in a continuous process mode 900 tonnes of loose stamping plant scrap; this scrap typically has residual zinc below 0.1% and sodium dragout below 0.001%. This paper reviews pilot plant performance and the economics of recycling galvanized steel and recovering zinc using a caustic process.

23774 (ANL/ET/CP–85947) **Simulation of fluid flow induced by opposing ac magnetic fields in a continuous casting mold.** Chang, F.C. (Argonne National Lab., IL (United States)); Hull, J.R.; Beitelman, L. Argonne National Lab., IL (United States). [1995]. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9504182–1: 78. steelmaking and 54. ironmaking conference, Nashville, TN (United States), 2-5 Apr 1995). Order Number DE95013764. Source: OSTI; NTIS; GPO Dep.

A numerical simulation was performed for a novel electromagnetic stirring system employing two rotating magnetic fields. The system controls stirring flow in the meniscus region of a continuous casting mold independently from the stirring induced within the remaining volume of the mold by a main electromagnetic stirrer (M-EMS). This control is achieved by applying to the meniscus region an auxiliary electromagnetic field whose direction of rotation is opposite to that of the main magnetic field produced by the M-EMS. The model computes values and spatial distributions of electromagnetic parameters and fluid flow in the stirred pools of mercury in cylindrical and square geometries. Also predicted are the relationships between electromagnetics and fluid flows pertinent to a dynamic equilibrium of the opposing stirring swirls in the meniscus region. Results of the numerical simulation compared well with measurements obtained from experiments with mercury pools.

23775 (CONF-9504123–1) **Solvent-free cleaning using a centrifugal cryogenic pellet accelerator.** Haines, J.R.; Fisher, P.W.; Foster, C.A. Oak Ridge National Lab., TN (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Innovative concepts technology and business opportunities; Denver, CO (United States); 20-21 Apr 1995. Order Number DE95013041. Source: OSTI; NTIS; GPO Dep.

An advanced centrifuge that accelerates frozen CO_2 pellets to high speeds for surface cleaning and paint removal is being developed at the Oak Ridge National Laboratory. The centrifuge-based accelerator was designed, fabricated, and tested under a program sponsored by the Warner Robins Air Logistics Center, Robins Air

Force Base, Georgia. In comparison to the more conventional compressed air "sandblast" pellet accelerators, the centrifugal accelerator system can achieve higher pellet speeds, has precise speed control, and is more than ten times as energy efficient. Furthermore, the use of frozen CO_2 pellets instead of conventional metal, plastic, sand, or other abrasive materials that remain solid at room temperature, minimizes the waste stream. This apparatus has been used to demonstrate cleaning of various surfaces, including removal of paint, oxide coatings, metal coatings, organic coatings, and oil and grease coatings from a variety of surfaces. The design and operation of the apparatus is discussed.

23776 (CRIE-W–94004) **Development of two-stage compression heat pump for hot water supply in commercial use. Demonstrated performance of a system applied with vertical shell and tube multifunction intermediate heat exchanger.** Hasegawa, H. (Central Research Institute of Electric Power Industry, Tokyo (Japan)); Saikawa, M.; Hashimoto, K.; Mimaki, T. Central Research Inst. of Electric Power Industry, Tokyo (Japan). Aug 1994. 49p. (In Japanese). Order Number DE95790556. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

The performance of a multifunction intermediate heat exchanger system was verified for the purpose of developing a high performance heat pump. Since a pressure rise was obtained by two compressors of a low stage and a high stage, the discharge pressure on the high stage side was able to be set high, enabling a high temperature hot water supply at 65°C. The feedwater of 10°C or so was preheated to 30 to 40°C with a low condensation temperature refrigerant that was partially condensed through an intermediate heat exchanger; the feedwater was further heated through a cascade heating up to 65°C with a high condensation temperature refrigerant by a condenser; and, therefore, the power required for the compressor was reduced. The intermediate heat exchanger was provided with two functions of water preheating and refrigerant vapor-liquid separating. The two functions conventionally had been carried out by separate units, but this time, they were put together into a vertical shell and tube multifunction intermediate heat exchanger. When a heating surface was too large and a water heating quantity was excessive, the system function was deteriorated. Therefore, the level height of the refrigerant inside the shell was adjusted by the sealed quantity of the refrigerant, making the heating surface properly adjustable. With this improved machine, the performance coefficient for hot water supply was improved from 3.44 to 3.72. 14 refs., 16 figs., 13 tabs.

23777 (DOE/AL–94598-1) **Revitalize the US silicon/ferrosilicon industry through energy-efficient technology. Part 1, Final report.** Larson, H.R.; Welborn, J.H. South Carolina Research Authority, North Charleston, SC (United States). Feb 1995. 174p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC04-93AL94598. Order Number DE95010689. Source: OSTI; NTIS; GPO Dep.

It is concluded that silicon metal and ferrosilicon can be very effectively produced in a DC submerged arc furnace. Specific energy consumption factors measured were favorable to the technology. Significant energy savings over conventional AC practice are likely. Hollow electrode feeding of the furnace does not appear feasible. Electrode consumption was 0.144 lbs/lb so silicon while making metal, much of which occurred above the burden pile. Silicon loss to fume averaged 19.5% of the silicon charge. In this furnace, 50% FeSi was more difficult to produce than silicon metal, and the furnace could not be run with full burden; it was operated successfully about 3/4 full. In the silicon metal portion, the furnace was operated in a fully submerged mode for several 3-day test campaigns. The industry must seriously consider the identified benefits of DC plasma arc technology for retrofit or new added silicon capacity.

23778 (DOE/CE/15452–T1) **Magnetic thin films formed in a glow discharge. Final report.** O'Keefe, T.J.; James, W.J. Missouri Univ., Rolla, MO (United States). 28 Oct 1994. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-91CE15452. Order Number DE95015460. Source: OSTI; NTIS; GPO Dep.

Since this project is a continuation of a cooperative effort between UMR and General Motor Research Laboratories (GMR), it seemed fitting to provide some background information which was instrumental in the evolution of this program. A family of filled epoxies that can be cast-to-size into sheet metal stamping dies has been developed by GMR. Advantages of this material over commercial plastic tooling materials are a fast curing rate, high strength, and negligible volume shrinkage after curing. Superior Tooling And Molding Plastic (STAMP) tooling dies are considerably cheaper and faster to make than steel tooling dies; therefore, they are currently used for prototype applications throughout General Motors. With improvement of wear resistance, STAMP dies can be used for limited production applications involving 10,000 or 20,000 parts. GMR proposed to provide a thin ($< 25\ \mu m$) wear surface for the cast-to-size STAMP die to extend its wear performance. The objective of the University of Missouri-Rolla (UMR) research effort is to technically evaluate methodologies to coat STAMP material to appreciably improve wear resistance. This does not necessarily mean that various types of coatings will be developed and evaluated. Rather, the primary responsibility is to characterize the nature of the STAMP material and design engineered films which will lead to an optimized system. An example of this was the finding that a thin polymer layer existed on the surface of an as-cast STAMP die necessitating removal if satisfactory adherence and toughness were to be attained. The next important finding involved the influence of particle size on wear. The theme of the research approach was maintained throughout the course of the project, with improvements being made as the causes of failure were determined and appropriate corrections or improvements were made.

23779 (DOE/CE/23810–60) **Evaluation of HFC-245ca for commercial use in low pressure chillers. Task 1 report: Preliminary estimates of chiller performance.** Keuper, E.F. (Trane Co., LaCrosse, WI (United States)); Hamm, F.B.; Glamm, P.R. Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States). 30 Apr 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. Order Number DE95014710. Source: OSTI; NTIS; GPO Dep.

HFC-245ca has been identified as a potential replacement for both CFC-11 and HCFC-123 in centrifugal chillers based on estimates of its thermodynamic properties, even though serious concerns exist about its flammability characteristics. The overall objective of this project is to assess the commercial viability of HFC-245ca in centrifugal chillers. This first report focuses on preliminary estimates of chiller performance only, while the next report will include laboratory performance data. The chiller performance estimates are based on early correlations of thermodynamic properties and predictions of compressor efficiency, with variations in heat transfer ignored until experimental data are obtained. Conclusions from this study include the following: The theoretical efficiency of HFC-245ca in optimized three stage chiller designs is very close to that for CFC-11 and HCFC-123 chillers. HFC-245ca is not attractive as a service retrofit in CFC-11 and HCFC-123 chillers because significant compressor modifications or dramatic lowering of condenser water temperatures would be required. Hurdles which must be overcome to apply HFC-245ca in centrifugal chillers include the flammability behavior, evaluation of toxicity, unknown heat transfer characteristics, uncertain thermodynamic properties, high refrigerant cost and construction of HFC-245ca manufacturing plants. Although the flammability of HFC-245ca can probably be reduced or eliminated by blending HFC-245ca with various inert compounds, addition of these compounds will lower the chiller performance. The chiller performance will be degraded due to less attractive thermodynamic properties and lower heat transfer performance if the blend fractionates. The experimental phase of the project will improve the accuracy of our performance estimates, and the commercial viability assessment will also include the impact of flammability, toxicity, product cost and product availability.

23780 (DOE/CE/40839–T3) **Kraft black liquor delivery systems. Final report.** Empie, J.; Lien, J. Institute of Paper Science and Technology, Atlanta, GA (United States). Feb 1995. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC02-88CE40839. Order Number DE95015552. Source: OSTI; NTIS; GPO Dep.

An improved spray nozzle for black liquor injection into kraft recovery boilers has been sought which is expected to result in obtaining a controlled, well-defined droplet size distribution. An environmentally sound experimental spray facility capable of delivering black liquor at normal firing temperatures has been operated at the Institute of Paper Science and Technology to help achieve that goal. Previous work showed that black liquor sprays have a characteristic size distribution which is determined by the fluid mechanical forces breaking up the spray sheet issuing from the nozzle. Recent work has centered on applying vibratory assist as an independently-controlled force on the sheet breakup process in an attempt to change the drop size distribution. Results are presented which feature vibratory assist applied in the axial direction.

23781 (DOE/EH–231-056/1294) **Disposal requirements for PCB waste.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Environmental Guidance. Dec 1994. 4p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95015487. Source: OSTI; NTIS; GPO Dep.

Polychlorinated biphenyls (PCBs) are a class of organic chemicals that had become widely used in industrial applications due to their practical physical and chemical properties. Historical uses of PCBs include dielectric fluids (used in utility transformers, capacitors, etc.), hydraulic fluids, and other applications requiring stable, fire-retardant materials. Due to findings that PCBs may cause adverse health effects and due to their persistence and accumulation in the environment, the Toxic Substances Control Act (TSCA), enacted on october 11, 1976, banned the manufacture of PCBs after 1978 [Section 6(e)]. The first PCB regulations, promulgated at 40 CFR Part 761, were finalized on February 17, 1978. These PCB regulations include requirements specifying disposal methods and marking (labeling) procedures, and controlling PCB use. To assist the Department of Energy (DOE) in its efforts to comply with the TSCA statute and implementing regulations, the Office of Environmental Guidance has prepared the document "Guidance on the Management of Polychlorinated Biphenyls (PCBs)." That document explains the requirements specified in the statute and regulations for managing PCBs including PCB use, storage, transport, and disposal. PCB materials that are no longer in use and have been declared a waste must be disposed of according to the requirements found at 40 CFR 761.60. These requirements establish disposal options for a multitude of PCB materials including soil and debris, liquid PCBs, sludges and slurries, containers, transformers, capacitors, hydraulic machines, and other electrical equipment. This Information Brief supplements the PCB guidance document by responding to common questions concerning disposal requirements for PCBs. It is one of a series of Information Briefs pertinent to PCB management issues.

23782 (DOE/EH–231-057/1294) **The PCB mark.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Environmental Guidance. Dec 1994. 2p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95015488. Source: OSTI; NTIS; GPO Dep.

Polychlorinated biphenyls (PCBs) are a class of organic chemicals that had become widely used in industrial applications due to their practical physical and chemical properties. Historical uses of PCBs include dielectric fluids (used in utility transformers, capacitors, etc.), hydraulic fluids, and other applications requiring stable, fire-retardant materials. Due to findings that PCBs may cause adverse health effects and due to their persistence and accumulation in the environment. That document explains the requirements specified in the statute and regulations for managing PCBs, including PCB use, storage, transport, and disposal. The requirements specified at 40 CFR Part 761.65 require most PCB wastes to be stored in a facility that meets the

specifications of that section. Additionally, the regulations include rules concerning time limits for PCBs and PCB items in storage, rules concerning leaking electrical equipment, and rules concerning types of containers used to store PCBs and PCB items. This Information Brief supplements the PCB guidance document by responding to common questions concerning storage requirements for PCBs. It is one of a series of Information Briefs pertinent to PCB management issues.

23785 (DOE/ID/12624–3) **Collection and conversion of silicon furnace waste gas into higher value products: Phase 3, 6 MW pilot plant dc closed furnace technology. Final report.** Dosaj, V.D. Dow Corning Corp., Midland, MI (United States). Jan 1995. 68p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-87ID12624. Order Number DE95015551. Source: OSTI; NTIS; GPO Dep.

The construction and operation of a 6 MW, closed dc furnace for smelting silicon was the primary focus of Phase 3. A 6 MW, dc closed furnace pilot plant was built in East Selkirk, Manitoba, Canada. The furnace is equipped with world's most modern automatic control system used to control and monitor the process variables and operational data. This control system is suitable for commercial applications and could be used with either closed or open dc furnaces for smelting silicon or ferrosilicon. The construction was started in September 1990, and the facility was operational within 18 months. Following successful commissioning of the pilot plant in June 1992, twelve smelting test campaigns were conducted through November 1994.

23786 (DOE/NE/37969–6) **University of Michigan – 1994-5 performance review of D&D activities. Annual report, June 1, 1994–May 31, 1995.** Wehe, D.K. Michigan Univ., Ann Arbor, MI (United States). 24 Feb 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86NE37969. Order Number DE95015194. Source: OSTI; NTIS; INIS; GPO Dep.

In accordance with work proposed to the ORNL D & D Program, UM navigation group has conducted research in two areas: (1) Theoretical and experimental work for the improvement of dead-reckoning accuracy in mobile robots and (2) a comprehensive literature survey on positioning methods for mobile robots. The radiation imaging group has conducted research in: (1) assessing the existing requirements for gamma ray imagers, (2) hot testing of existing gamma ray imagers, and (3) design and testing of a prototype rotating aperture camera for improved signal/noise ratios and sensitivity.

23787 (ETDE-BR–0001) **Use of electric energy in aviculture related activities.** Pogi, Rita de Cassia. UNESP, Botucatu, SP (Brazil). Faculdade de Ciencias Agronomicas. Jun 1991. 116p. (In Portugese). Order Number DE95789945. Source: OSTI; NTIS (US Sales Only).

In the present research work, the use of electric energy was studied in two activities connected to aviculture, ration factory and hatchery, located in the surroundings of Tiete, in the State of Sao Paulo. The data obtained by the factory refer to the monthly kilos of ration produced between 1986 and 1988; for the hatchery the period studied was 1987-1989 and the monthly data of production refer to one-day chicks. Based on these data it was possible to analyse the behaviour of the two activities as regard as the use of electric energy, through the examining of the electric powers, consumption and production unit, figured average time of electric installations use, kWh cost, functional dependency between the load factor and consumption. Through these evaluations one concludes that in the ration factory the relation (Wh) consumption per kilo varied from 10,30 to 11,05, in the hatchery the relation (Wh) consumption per chick showed a variation from 50,32 to 77,27 and the confronting of the energy use shows that in the hatchery it was more efficient, being connect up to 68,49% of the monthly hours available while in the ration factory this value falls down to 39,59%. (author). 34 refs, 23 figs, 34 tabs

23788 (ETDE-BR–0003) **The use of electric energy in central-pivot systems in the irrigated areas of the Guaira region - Sao Paulo, Brazil.** Cagnon, Jose Angelo. UNESP, Botucatu, SP (Brazil). Faculdade de Ciencias Agronomicas. Dec 1989. 130p. (In Portugese). Order Number DE95789947. Source: OSTI; NTIS (US Sales Only).

In this work the energetic aspects of the operation of irrigation equipment of central-pivot in the region of Guaira - SP were studied. For this purpose were picked up data of 71 irrigation systems, with different capacities of power, grouped according the transformers used: 75, 112,5, 150 and 225 kVa. Important aspects of the evaluation of the electric parameters (consumption, demand and load factor) were analysed, involving climatic parameters, tariff legislation and irrigated area. Regarding the consumption and demand of electric power, were obtained the mean values for the period of March 1987 to February 1989. Tables and graphs containing the results were built, and were used to evaluate the relationship between the mentioned parameters. It was studied the rain distribution along the period and its influence on the consumption and demand values. (author). 33 refs, 27 figs, 26 tabs

23789 (ETDE-BR–0013) **Analysis of energy consumption and the viability to increase the energy use efficiency for thermal applications in the major industrial sectors through the balancing of thermal and electric energy.** Fernandes Filho, Guilherme E. Filippo. UNESP, Guaratingueta, SP (Brazil). Faculdade de Engenharia. 1988. 318p. (In Portugese). Order Number DE95789957. Source: OSTI; NTIS (US Sales Only).

The objective of this work is to propose the increase of electro technologies and co-generation use in the industrial process. Electro technologies must be understood as electro heat, and co-generation as the use liter residual heat of fuels in the generation of electric energy or more efficient introduction of fuels in processes. The more important energetics and forms of consume for thermic proposes in several industrial sectors after researching about 250 industries are identified. The energetic diagnostics of at least one industry of each sector and typical examples of national industry in order to determined the consumption performance at equipment level is presented. Technological alternatives supported in electro technologies and co-generation in order to increase energetic performance of equipment and processes are shown. In case of application of these alternatives by the industry, the consumption of electric energy will increase. In order to avoid overload in the electric system, this paper proposes solutions supported by Magneto-Hydrodynamic (MHD). 89 refs, 112 figs, 130 tabs

23790 (ETDE-BR–0020) **Electric power consumption in the processing of corn used to feed chickens.** Dantas, Antonio Augusto Aguilar. UNESP, Botucatu, SP (Brazil). Faculdade de Ciencias Agronomicas. Dec 1989. 116p. (In Portugese). Order Number DE95789964. Source: OSTI; NTIS (US Sales Only).

In the present research the corn was processed by small hammer mill with different sieves. The specific electric parameters were recorded. The resulting ground corn were used in rations for broilers which had their performance estimated. The data on the processing of corn was studied to relate with chicks development during the twenty eight days of initial growth period. The results show that: the 5 cv engine consumed less energy than the 7.5 cv to process 1 kilo of corn; the weight in the seven initial days of breeding was greater in the treatment which used ground corn processed in the smaller sieves; the food conversion in the seven initial days was greater in function of the sieves with smaller screens; the different rations with processed corn in the four sieves did not interfere in the chicks consumption; there was a big difference in the energy V Ah to process the corn in the 0.8 mm sieve in comparison to the others; the necessary increase of apparent energy (R) for the chicks development for all rations and according to periods (d), followed the expression 1 n (R) = -2,76 + 1.39 1 n (d); the apparent energy increase (R) is smaller in the initial period of chicks development increases in the subsequent periods and tends to stabilize after the day twenty first. 48 refs, 52 tabs, 18 figs

23791 (ETDE-BR–0021) **The use of electric power in coffee processing and corn drying to produce animal rations.** Rodriguez, Eduardo Mendoza. UNESP, Botucatu, SP (Brazil). Faculdade de Ciencias Agronomicas. Nov 1990. 90p. (In Portugese). Order Number DE95789965. Source: OSTI; NTIS (US Sales Only).

The purpose of this work is to study the way in which the electric energy is used in two agroindustrial activities by means of the analysis of electric parameters and data from the processing of

agricultural products collected from 1986 to 1988. The activities studied were the coffee processing of agricultural and the corn drying for feed production. The conclusions are: the seasonal aspects of the coffee production and its commercialization have a semestral behaviour in their processing and consumption of energy; the corn drying associated with the feed production have their activities and consumption of electric energy distributed in periods of four months; the load factor of the coffee processing plant ranged from 0.09 to 0.29 according to the relation of the kilos of coffee processed per kWh, which fluctuated from 9.04 to 36.86; the combination of corn drying and feed production, both occurring at the same place and knowing its seasonal characteristics, enables the rational use of electric energy, keeping its consumption constant; the load factor of the plant ranged from 0.19 to 0.36 with an average value of 0.27. This implies that these activities used the electric energy available more efficiently when comparing to the coffee processing; the average price of the kWh for the coffee processing was higher than the corn drying and feed production in such that the increment in kWh of the coffee processing ranged from 25 to 41% with an average value of 34.3% which increased the costs; the total demand charged in both activities is the sum of both demands, supposing they are coincident in time, which raises the electric energy costs. 28 refs, 31 tabs, 9 figs

23792 (ETDE-BR–0026) **Electric energy consumption in soybean and sorghum milling used in chickens rations.** Mendonca, Maria Denise. UNESP, Botucatu, SP (Brazil). Faculdade de Ciencias Agronomicas. Nov 1990. 120p. (In Portugese). Order Number DE95789970. Source: OSTI; NTIS (US Sales Only).

This research aims the evaluation of the performance of milling machines, considering the electric energy consumption to obtain rations of different granulometry and nutritive quality analysis of this rations in relation to chicken growth. 50 refs, 60 tabs, 17 figs.

23793 (ETDE-DE–163) **Climate-compatible energy supply in Baden-Wuerttemberg. Energy conservation and CO_2 reduction on the traffic sector - vehicle technology.** Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg. Arbeitsberichte, v. 22. Fiedler, R.G. (Forschungsinstitut fuer Kraftfahrwesen und Fahrzeugmotoren Stuttgart (FKFS) (Germany)); Helfer, M.; Essers, U. Akademie fuer Technikfolgenabschaetzung in Baden-Wuerttemberg, Stuttgart (Germany). Apr 1994. 84p. (In German). Order Number DE95790270. Source: OSTI; NTIS (US Sales Only).

This brochure is one of the progress reports of the "Academy of Technology Assessment in Baden-Wuerttemberg". It contains an expert's opinion which discusses and assesses the technical potentials of energy conservation and CO_2 reduction in motor cars and engines in consideration of the number of vehicles currently running in Baden-Wuerttemberg. The evaluation of relevant literature and the processing of the information obtained follow the structure of the expert's opinion: Characterisation of the technology - Technical potential - Effects. (orig.)

23794 (KCP–613-5587) **Using STEP to integrate design features with manufacturing features.** Brooks, S.L. (Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div.); Kirk, W.J. III; Simons, W.R. Jr.; Brown, C.W.; Greenway, R.B. Jr. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Apr 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. (CONF-9509140–1: 15. ASME international computer in engineering conference, Boston, MA (United States), 17-21 Sep 1995). Order Number DE95010188. Source: OSTI; NTIS; GPO Dep.

There are several parametric or variational feature-based solid modeling design tools that aid the user in productively creating a product design. However, most of these systems do not address mapping from the design feature to the manufacturing feature. We present a representation for manufacturing features that integrate with design features using the ISO 10303 STEP product definition standard. We extend the STEP AP203 entities with feature definitions in a way similar to AP224, the working draft of STEP Features. The manufacturing features presented here provide a means to link design changes to manufacturing feature and/or process changes. Currently, most systems depend on humans to detect and propagate design and process changes to manufacturing features and plans. Toward solving this problem, we are working on a manufacturing feature representation that can detect a design or process change and correct some, or at a minimum, flag the manufacturing engineer where the change affects manufacturing operations. We define manufacturing features as a collection of faces and edges. It is important that these faces and edges can be uniquely identified in the design feature representation. The STEP entity Shape-Aspect is used to permanently name the face or edge. Our features are built from expressions that reference the design feature's faces and edges that can be reevaluated to propagate a design change. In this paper we present this new approach for representing manufacturing features and discuss its current and planned implementation.

23795 (ORNL/TM–12905) **Evaluation of density separation and other treatment methods for plastic media blasting (PMB) waste.** Spence, R.D.; Morgan, I.L.; Trotter, D.R. Oak Ridge National Lab., TN (United States). [1995]. 46p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95011629. Source: OSTI; NTIS; GPO Dep.

The United States Air Force has developed plastic media blasting (PMB) to replace solvent paint stripping of its aircraft. This paint blasting operation generates a waste stream of mainly pulverized plastic, but the stream also contains enough paint pigments to make the PMB waste RCRA hazardous. A Phase I study identified density separation as the preferred treatment alternative to land disposal of the entire PMB waste stream in a hazardous landfill. This study found density separation to be a less attractive alternative to self-encapsulation, solidification/stabilization (S/S), and low-temperature ashing. Self-encapsulation resulted in a volume decrease but only moderate improvement in Toxicity Characteristic Leaching Procedure (TCLP) performance Solidification/Stabilization (S/S) into cementiaous waste for resulted in excellent TCLP performances, but volume increases. Low-temperature ashing resulted in dramatic volume decreases, but off-gas control is required to contain all the RCRA metals. The resulting ash must be stabilized (e.g., S/S) to meet TCLP limits.

23796 (PNL–10546) **Ammonia and ammonium hydroxide sensors for ammonia/water absorption machines: Literature review and data compilation.** Anheier, N.C. Jr.; McDonald, C.E.; Cuta, J.M.; Cuta, F.M.; Olsen, K.B. Pacific Northwest Lab., Richland, WA (United States). May 1995. 63p. Sponsored by USDOE, Washington, DC (United States);Gas Research Inst., Chicago, IL (United States). DOE Contract AC06-76RL01830. Order Number DE95011871. Source: OSTI; NTIS; GPO Dep.

This report describes an evaluation of various sensing techniques for determining the ammonia concentration in the working fluid of ammonia/water absorption cycle systems. The purpose of this work was to determine if any existing sensor technology or instrumentation could provide an accurate, reliable, and cost-effective continuous measure of ammonia concentration in water. The resulting information will be used for design optimization and cycle control in an ammonia-absorption heat pump. PNL researchers evaluated each sensing technology against a set of general requirements characterizing the potential operating conditions within the absorption cycle. The criteria included the physical constraints for in situ operation, sensor characteristics, and sensor application. PNL performed an extensive literature search, which uncovered several promising sensing technologies that might be applicable to this problem. Sixty-two references were investigated, and 33 commercial vendors were identified as having ammonia sensors. The technologies for ammonia sensing are acoustic wave, refractive index, electrode, thermal, ion-selective field-effect transistor (ISFET), electrical conductivity, pH/colormetric, and optical absorption. Based on information acquired in the literature search, PNL recommends that follow-on activities focus on ISFET devices and a fiber optic evanescent sensor with a colormetric indicator. The ISFET and fiber optic evanescent sensor are inherently microminiature and capable of in situ measurements. Further, both techniques have been demonstrated selective to the ammonium ion (NH_4^+). The primary issue remaining is how to make the sensors sufficiently corrosion-resistant to be useful in practice.

23797 (PNL-SA-25944) **Waste reduction using carbon dioxide: A solvent substitute for precision cleaning applications.** Phelphs, M.R. (and others); Hogan, M.O.; Snowden-Swan, L.J. Pacific Northwest Lab., Richland, WA (United States). May 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9505241--1: 1995 precision cleaning conference, Rosemont, IL (United States), 15-17 May 1995). Order Number DE95014629. Source: OSTI; NTIS; GPO Dep.

The U.S. Department of Energy's (DOE) Industrial Waste Program (IWP) has been sponsoring the research, development, and commercialization of supercritical fluid cleaning technology for replacement of traditional solvent cleaning processes. Los Alamos National Laboratory and Pacific Northwest Laboratory have been working through this collaborative effort to test the efficacy of carbon dioxide (CO_2) cleaning. Tests were performed on a variety of substrates at various solvent conditions for a large number of common contaminants to characterize cleaning performance. Cleaning efficiencies with respect to system dynamics were also studied. Results of these tests show that supercritical and near-critical carbon dioxide is not only an effective solvent for precision cleaning applications of parts such as gyroscopes, bearing assemblies, and machine tools but is also feasible for bulk cleaning operations for a variety of industrial needs. It has been tested and shown to be effective for a range of substrates including laser optics components, computer disk drives, and cloth rags. Metals, including stainless steel, beryllium, gold, silver, copper and others; ceramics; and elastomeric seals such as Teflon, silicone, and epoxy potting compounds are highly compatible with SuperCritical CO_2 ($SCCO_2$). Many contaminants, including silicones, Krytox, hydrocarbons, esters, fluorocarbons, gyroscope damping and fill fluids, and machining oils and lubricating oils, will dissolve in $SCCO_2$. In general, nonpolar, hydrophobic contaminants such as oils dissolve well, while hydrophilic contaminants such as inorganic salts do not. The parts and contaminants mentioned here are not the only applications for SCCO, cleaning, as the full range of possibilities is still being defined by developers and users of the technology. The many advantages of $SCCO_2$ indicate that it is a technology that should carry industrial cleaning operations into the future.

23798 (UCRL-JC-119975) **Plasma arc heated secondary combustion chamber.** Haun, R. (Retech, Inc. (United States)); Paulson, B.; Schlienger, M.; Goerz, D.; Kerns, J.; Vernazza, J. Lawrence Livermore National Lab., CA (United States). Feb 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950216--149: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95014991. Source: OSTI; NTIS; GPO Dep.

This paper describes a secondary combustion chamber (SCC) for hazardous waste treatment systems that uses a plasma arc torch as the heat source. Developed under a cooperative research and development agreement (CRADA) between Retech, Inc. and Lawrence Livermore National Laboratory (LLNL), the unit is intended primarily to handle the off-gas from a Plasma Arc Centrifugal Treatment (PACT) system. ft is designed to heat the effluent gas which may contain volatile organic compounds, and maintain the gas temperature above 1000 C for two seconds or more. The benefits of using a plasma arc gas heater are described in comparison to a conventional fossil fuel heated SCC. Thermal design considerations are discussed. Analysis and experimental results are presented to show the effectiveness in destroying hazardous compounds and reducing the total volume of gaseous emissions.

23799 (UCRL-JC-120745) **A lightweight high performance dual-axis gimbal for space applications.** Pines, D.J.; Hakala, D.B.; Malueg, R. Lawrence Livermore National Lab., CA (United States). 5 May 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950472--8: SPIE international symposium on aerospace/defense sensing and dual-use photonics, Orlando, FL (United States), 17-21 Apr 1995). Order Number DE95014395. Source: OSTI; NTIS; GPO Dep.

This paper describes the design, development and performance of a lightweight precision gimbal with dual-axis slew capability to be used in a closed-loop optical tracking system at Lawrence Livermore National Laboratory-LLNL. The motivation for the development of this gimbal originates from the need to acquire and accurately localize warm objects (T~500 K) in a cluttered background. The design of the gimbal is centered around meeting the following performance requirements: pointing accuracy with control $< 35\ \mu rad\text{-}(1\text{-}\omega)$; slew capability > 0.2 rad/sec; mechanical weight < 5 kg. These performance requirements are derived by attempting to track a single target from multiple satellites in low Earth orbit using a mid-wave infrared camera. Key components in the gimbal hardware that are essential to meeting the performance objectives include a nickel plated beryllium mirro, an accurate lightweight capacitive pickoff device for angular measurement about the elevation axis, a 16-bit coarse/fine resolver for angular measurement about the azimuth axis, a toroidally wound motor with low hysteresis for providing torque about the azimuth axis, and the selection of beryllium parts to insure high stiffness to weight ratios and more efficient thermal conductivity. Each of these elements are discussed in detail to illustrate the design trades performed to meet the tracking and slewing requirements demanded. Preliminary experimental results are also given for various commanded tracking maneuvers.

23800 (WHC-SD-WM-TRP-237) **Laboratory testing of geomembrane for waste containment EPA Method 9090, March 1995. Final report.** Whitlock, R.W. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); TRI/Environmental, Inc., Austin, TX (United States). 15 May 1995. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95012589. Source: OSTI; NTIS; GPO Dep.

This report describes the work performed by TRI/Environmental, Inc. (TRI) to determine the chemical compatibility of one geomembrane and one seamed geomembrane with four synthetically generated leachates. The objective was to determine the resistance of the geomembrane to changes caused by exposure to the leachates. Changes in physical and mechanical properties were measured after exposure to the leachates at 23 C and 50 C for 30, 60, 90 and 120 days. Exposures were performed in accordance with the exposure regimen specified in US Environmental Protection Agency (EPA) Method 9090A. Methods, results and discussion are provided. Test results are also provided in the Tables of Results which accompany this report.

23801 (Y/ME-94-08) **Kearney and Trecker Milwaukee Matic 600.** Seat, J.E.; Rogers, K.S. Oak Ridge Y-12 Plant, TN (United States). 21 Oct 1994. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009054. Source: OSTI; NTIS; GPO Dep.

Copy of title page and of 1332.15 to Herb Wolford.

A computer model of a Kearney and Tracker (K and T) Milwaukee Matic 600 (MM600) with a Gemini controller for use under the Deneb Robotics, Inc. simulation environment has been constructed. The simulation uses the K and T controller and standard MM600 machine geometry. Both the machine geometry and the controller are provided. The machine has been constructed using K and T's standard machine dimensions and setup. The controller simulation addresses the most typically used NC codes, but may not be setup for extremely specialized functions. The machine geometry has been reduced to simulate only those components and surfaces which could possibly interfere or collide with other machine components or the workpiece envelope. The level of detail has been reduced to a functional level to enhance computational performance during simulation. The model may be directly used in the Virtual-NC environment for a complete machining simulator, or the model with kinematics may be used in IGRIP. The geometry is suitable for translation into standard file formats for importation into other systems.

23802 (CRIE-W-93033) **Stabilization of transferred type A.C. arc plasma by adding pulse to current zero point.** Iwata, M. (Central Research Institute of Electric Power Industry, Tokyo (Japan)); Yasui, S.; Shibuya, M. Central Research Inst. of Electric

Power Industry, Tokyo (Japan). Aug 1994. 19p. (In Japanese). Order Number DE95790558. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

The stabilization of transferred type plasma was examined for the purpose of an A.C. plasma application in waste disposal. Being a method to generate plasma between a torch electrode and a heating object, the transferred type plasma was provided with a high heating efficiency; however, it was likely to be unstable because the plasma length is long. The plasma was able to be stabilized by generating a 200A, 50Hz transferred type A.C. plasma in the atmosphere and by superimposing a pulse current at 10 to 20A with the rising/falling time of 2μs and the pulse width of 400μs. The reason was that the rising ratio dv/dt of interelectrode voltage after current zero point was able to be increased greatly by superimposing a pulse current immediately before A.C. current zero point and that current starting voltage and reignition voltage were able to be decreased through dielectric breakdown between the electrodes before an interelectrode insulation was fully recovered. As an interelectrode distance is lengthened, a high supply voltage was required for the stabilization; however, the stabilization of plasma was made possible even under a low supply voltage by decreasing reignition voltage through the superimposition of a pulse current. 9 refs., 9 figs., 1 tab.

23803 (DOE/CE/26515–T1) **Steamtown District Heating and Cooling Project, Scranton, Pennsylvania. Final report.** Joseph Technology Corp., Inc., Woodcliff Lake, NJ (United States). Apr 1990. 89p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-85CE26515. Order Number DE95009801. Source: OSTI; NTIS; GPO Dep.

This report summarizes the activities of a study intended to examine the feasibility of a district heating and cooling alternative for the Steamtown National Historic Site in Scranton, PA. The objective of the study was to investigate the import of steam from the existing district heating system in Scranton which is operated by the Community Central Energy Corporation and through the use of modern technology provide hot and chilled water to Steamtown for its internal heating and cooling requirements. Such a project would benefit Steamtown by introducing a clean technology, eliminating on-site fuel use, avoiding first costs for central heating and cooling plants and reducing operation and maintenance expenditures. For operators of the existing district heating system, this project represents an opportunity to expand their customer base and demonstrate new technologies. The study was conducted by Joseph Technology Corporation, Inc. and performed for the Community Central Energy Corporation through a grant by the US Department of Energy. Steamtown was represented by the National Park Service, the developers of the site.

23804 (DOE/CH/10093–322-Rev.2) **Using landfill gas for energy: Projects that pay.** National Renewable Energy Lab., Golden, CO (United States). Feb 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE94006897. Source: OSTI; NTIS; GPO Dep.

Pending Environmental Protection Agency regulations will require 500 to 700 landfills to control gas emissions resulting from decomposing garbage. Conversion of landfill gas to energy not only meets regulations, but also creates energy and revenue for local governments.

23805 (NREL/TP–430-7974) **Case studies in residual use and energy conservation at wastewater treatment plants.** Stewart, D. (Science Applications International Corp., Los Altos, CA (United States)). National Renewable Energy Lab., Golden, CO (United States); Science Applications International Corp., Los Altos, CA (United States). Jun 1995. 72p. Sponsored by USDOE, Washington, DC (United States);Environmental Protection Agency, Washington, DC (United States). DOE Contract AC36-83CH10093. (EPA–832-R-95-003). Order Number DE95009216. Source: OSTI; NTIS; GPO Dep.

The US Environmental Protection Agency (EPA) and the National Renewable Energy Laboratory (NREL) for the US Department of Energy (DOE) funded a study to document energy conservation activities and their effects on operation costs, regulatory compliance, and process optimization at several wastewater treatment plants (WWTPS). The purpose of this report is to review the efforts of wastewater treatment Facilities that use residuals as fuels. Case histories are presented for facilities that have taken measures to reduce energy consumption during wastewater treatment. Most of the WWTPs discussed in this report have retrofitted existing facilities to achieve energy conservation. The case studies of energy conservation measures found no effects on the facilities' ability to comply with NPDES permits. Indeed, energy conservation activities enhance environmental compliance in several ways.

23806 (NREL/TP–430-7976) **Environmental legislation and the regulation of waste management in Sweden.** National Renewable Energy Lab., Golden, CO (United States); CSI Resource Systems, Inc., Duxbury, MA (United States). May 1995. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95009219. Source: OSTI; NTIS; GPO Dep.

This study examines the regulatory aspects of waste management in Sweden, with a particular emphasis on regulating organic compounds produced by waste-to-energy facilities. Since the early 1960s, waste-to-energy has played a significant role in managing waste in Sweden. In 1993, more than 50% of the municipal solid waste available for treatment or disposal following source separation efforts was processed in one of the 21 waste-to-energy facilities operating in Sweden. This report examines Sweden's regulatory environment, its history of setting emission limits on waste management facilities, and the current status of regulations.

23807 (PNL–10592) **Hanford 300 Area steam transition preliminary utility options study.** Olson, N.J.; Weakley, S.A.; Berman, M.J. Pacific Northwest Lab., Richland, WA (United States). Jun 1995. 104p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95014185. Source: OSTI; NTIS; GPO Dep.

The cost of steam in the Hanford 300 Area is approaching $60 per million Btu; the cost in industry is $\approx$ $10 per million Btu. The cost of steam in the 300 Area is expected to continue to increase because of the age of the central steam system, load decreases, safety requirements, and environmental regulations. The intent of this report is to evaluate options that would more cost-effectively met the future heating needs of the buildings in the 300 Area. In general, the options fall into two categories: central systems and distributed systems. A representative option from each category was analyzed using the life-cycle cost analysis (LCCA) techniques mandated by the federal government. The central plant option chosen for evaluation was the existing central steam plant modified to allow continued operation. The distributed option chosen was a dedicated heating system for each building.

23808 (UCRL-ID–120296) **Laboratory studies of a hydrothermal pretreatment process for municipal solid waste.** Wallman, H. Lawrence Livermore National Lab., CA (United States). 6 Apr 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015132. Source: OSTI; NTIS; GPO Dep.

The objective of this work was to establish operating conditions for a hydrothermal pre-processing scheme for municipal solid wastes that produce a good slurry product for conversion in a Texaco gasifier. Work was carried out with model components such as wood, paper, and paper/plastic mixtures.

23809 (ANL/ES/CP–85485) **Devices to improve the performance of a conventional two-stroke spark ignition engine.** Poola, R.B. (Argonne National Lab., IL (United States)); Nagalingam, B.; Gopalakrishnan, K.V. Argonne National Lab., IL (United States). [1995]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9504174–1: American Society of Mechanical Engineers (ASME)

1995 Spring technical conference, Marietta, OH (United States), 23-26 Apr 1995). Order Number DE95013492. Source: OSTI; NTIS; GPO Dep.

This paper presents research efforts made in three different phases with the objective of improving the fuel economy of and reducing exhaust emissions from conventional, carbureted, two-stroke spark ignition (SI) engines, which are widely employed in two-wheel transportation in India. A review concerning the existing two-stroke engine technology for this application is included. In the first phase, a new scavenging system was developed and tested to reduce the loss of fresh charge through the exhaust port. In die second phase, the following measures were carried out to improve the combustion process: (1) using an in-cylinder catalyst, such as copper, chromium, and nickel, in the form of coating; (2) providing moderate thermal insulation in the combustion chamber, either by depositing thin ceramic material or by metal inserts; (3) developing a high-energy ignition system; and (4) employing high-octane fuel, such as methanol, ethanol, eucalyptus oil, and orange oil, as a blending agent with gasoline. Based on the effectiveness of the above measures, an optimized design was developed in the final phase to achieve improved performance. Test results indicate that with an optimized two-stroke SI engine, the maximum percentage improvement in brake thermal efficiency is about 31%, together with a reduction of 3400 ppm in hydrocarbons (HC) and 3% by volume of carbon monoxide (CO) emissions over the normal engine (at 3 kW, 3000 rpm). Higher cylinder peak pressures (3-5 bar), lower ignition delay (2-4°CA)° and shorter combustion duration (4-10 °CA) are obtained. The knock-limited power output is also enhanced by 12.7% at a high compression ratio (CR) of 9:1. The proposed modifications in the optimized design are simple, low-cost and easy to adopt for both production and existing engines.

23810 (SAND–95-8562C) **Autoignition of hydrogen under direct-injection compression-ignition engine conditions.** Naber, J.D.; Siebers, D.L. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9504161–1: Central States/Western States Institute and American Flame Research committee meeting, San Antonio, TX (United States), 23-26 Apr 1995). Order Number DE95010760. Source: OSTI; NTIS; GPO Dep.

The autoignition and combustion of hydrogen were studied in a constant-volume combustion vessel under simulated late-cycle, direct-injection (DI) diesel engine conditions. A strong Arrhenius dependence of ignition delay on temperature was observed; however, the ignition delay dependence on the other variables examined was small. The results show that a reasonable ignition delay (< 2 ms) can be achieved at ambient gas temperatures in excess of 1100 K for oxygen concentrations as low as 5%. In addition, the results show that DI hydrogen combustion rates are insensitive to these lower levels of oxygen. The insensitivity of ignition delay and combustion rate to reduced oxygen concentration is significant because it offers the potential for a dramatic reduction in emissions of nitric oxides from a compression-ignited DI hydrogen engine through use of large quantities of exhaust-gas-recirculation.

23811 (ANL/CMT/CP–85327) **Development and performance characteristics of bipolar lithium/iron disulfide battery.** Vissers, D.R.; Kaun, T.D.; Prakash, J.; Turner, R.L.; Hash, M.C.; Henriksen, G.L. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950298–1: International workshop on advanced batteries, Osaka (Japan), 22-24 Feb 1995). Order Number DE95012469. Source: OSTI; NTIS; GPO Dep.

The purpose of this paper is to review the projected performance and safety characteristics of the bipolar lithium/iron disulfide battery as it relates to a propulsion device for electric vehicles (EVs). Lithium/iron disulfide cells with a molten-salt electrolyte are well suited to the development of a bipolar battery. Long strings of series-connected cells are practical since these cells always fail in a short-circuit condition, and a technique has been developed to equalize the cells whose capacity may have gotten out of balance after many cycles. To maintain the electrolyte molten, the battery is normally operated at 425°C. The $LiFeS_2$ cell exhibits the high performance and long life needed for the electric vehicle application. The cell uses a molten-salt electrolyte whose composition is 34 mol% LiCl 32.5 mol% LiBr-33.5. mol% KBr (m.p. 322°C, and a densely loaded FeS_2 electrode that is only operated on the upper voltage plateau (UP). The Li-Al alloy is used as the negative electrode in the cell. The alloy is normally operated in the $\alpha+\beta$ region of the phase diagram and covers a compositional range of 9 to 47 atom % lithium. This two-phase alloy is within 300 mV of the pure lithium metal potential, but remains solid at cell operating temperatures (400-450°C).

23812 (ANL/ESD–27) **User's guide to EAGLES Version 1.1: An electric- and gasoline-vehicle fuel-efficiency software package.** Marr, W.W. Argonne National Lab., IL (United States). Jan 1995. 136p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95014763. Source: OSTI; NTIS; GPO Dep.

EAGLES is an interactive microcomputer software package for the analysis of fuel efficiency in electric-vehicle (EV) applications or the estimation of fuel economy for a gasoline vehicle. The principal objective of the EV analysis is to enable the prediction of EV performance on the basis of laboratory test data for batteries. The EV model included in the software package provides a second-by-second simulation of battery voltage and current for any specified vehicle velocity/time or power/time profile. The capability of the battery is modeled by an algorithm that relates the battery voltage to the withdrawn (or charged) current, taking into account the effect of battery depth-of-discharge. Alternatively, the software package can be used to determine the size of the battery needed to satisfy given vehicle mission requirements. For gasoline vehicles, a generic fuel-economy model based on data from EPA Test Car List 1991 is included in the software package. For both types of vehicles, effects of heating/cooling loads on vehicle performance, including range penalty for EVs, can be studied. Also available is an option to estimate the time needed by a specified vehicle to reach a certain speed with the application of a constant power and an option to compute the fraction of time and/or distance in a driving cycle at speeds exceeding a specified value. Certain parameters can be changed interactively prior to a run.

23813 (DOE/CE/50389–1) **Direct-hydrogen-fueled proton-exchange-membrane (PEM) fuel cell system for transportation applications. Quarterly technical progress report Number 1, July 1–September 30, 1994.** Oei, G. Ford Motor Co., Dearborn, MI (United States). 4 Nov 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-94CE50389. Order Number DE95009675. Source: OSTI; NTIS; GPO Dep.

This is the first Technical Progress Report for DOE Contract No. DE-AC02-94CE50389 awarded to Ford Motor Company on July 1, 1994. The overall objective of this contract is to advance the Proton-Exchange-Membrane (PEM) fuel cell technology for automotive applications. Specifically, the objectives resulting from this contract are to: (1) develop and demonstrate on a laboratory propulsion system within 2-1/2 years a fully functional PEM Fuel Cell Power System (including fuel cell peripherals, peak power augmentation and controls), this propulsion system will achieve, or will be shown to have the growth potential to achieve, the weights, volumes, and production costs which are competitive with those same attributes of equivalently performing internal combustion engine propulsion systems; (2) select and demonstrate a baseline onboard hydrogen storage method with acceptable weight, volume, cost, and safety features and analyze future alternatives; (3) analyze the hydrogen infrastructure components to ensure that hydrogen can be safely supplied to vehicles at geographically widespread convenient sites and at prices which are less than current gasoline prices per vehicle-mile; (4) identify any future R and D needs for a fully integrated vehicle and for achieving the system cost and performance goals.

23814 (DOE/ID/13074–T16) **Kansas State University: DOE/KEURP Site Operator Program. Year 4, fourth quarterly report, April 1, 1995–June 30, 1995.** Kansas State Univ., Manhattan, KS (United States). [1995]. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC07-91ID13074. Order Number DE95015960. Source: OSTI; NTIS; GPO Dep.

Kansas State University, in support of a DOE and Kansas Electric Utilities Research Program subject contract, continues to test, evaluate, demonstrate, and develop electric vehicle and infrastructure technology. K-State is operating two Soleq EVcort vehicles. During this reporting period both vehicles were brought back to full operational status after warranty service was completed by Soleq. Vehicle failures occurred due to three unrelated battery cable failures in addition to the replacement of one battery. Both vehicles are being operated on a routine basis. K-State, along with York Technical College, has established a relationship with Troy Design and Manufacturing (TDM) Redford, Michigan. K-State has ordered no less than four Ford Ranger electric trucks from TDM. K-State is involved in the steering committee that is monitoring and refining information to direct the design and testing of these new technology vehicles. TDM should become the first automotive manufacturer certified by one of the Big Three under their Quality Vehicle Manufacturer program. Kansas State University and the Kansas Electric Utility Research Program look forward to working with TDM on their new EV program.

23815 (SAND–95-1125C) **SERAPHIM: A propulsion technology for fast trains.** Kelly, B.; Turman, B.; Marder, B.; Rohwein, G.; Aeschliman, D.; Cowan, B. Sandia National Labs., Albuquerque, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950857–1: Society of Automotive Engineers future transportation technology conference and exposition, Costa Mesa, CA (United States), 7-10 Aug 1995). Order Number DE95013017. Source: OSTI; NTIS; GPO Dep.

The Segmented Rail Phased Induction Motor (SERAPHIM) is a compact, pulsed linear induction motor (LIM) offering a unique capability for very high speed train propulsion. It uses technology developed for the Sandia coilgun, an electromagnetic launcher designed to accelerate projectiles to several kilometers per second. Both aluminum cylinders and plates were accelerated to a kilometer per second (Mach 3) by passing through a sequence of coils which were energized at the appropriate time. Although this technology was developed for ultra-high velocity, it can be readily adapted to train propulsion for which, at sea level, the power required to overcome air resistance limits the operational speed to a more modest 300 mph. Here, the geometry is reversed. The coils are on the vehicle and the "projectiles" are fixed along the roadbed. SERAPHIM operates not by embedding flux in a conductor, but by excluding it. In this propulsion scheme, pairs of closely spaced coils on the vehicle straddle a segmented aluminum reaction rail. A high frequency current is switched on as a coil pair crosses an edge and remains off as they overtake the next segment. This induces surface currents which repel the coil. In essence, the pulsed coils push off segment edges because at the high frequency of operation, the flux has insufficient time to penetrate. In contrast to conventional LIMs, the performance actually improves with velocity, even for a minimal motor consisting of a single coil pair reacting with a single plate. This paper will present results of proof-of-principle tests, electromagnetic computer simulations, and systems analysis. It is concluded that this new linear induction motor can be implemented using existing technology and is a promising alternative propulsion method for very high speed rail transportation.

23816 (UCRL-JC–120308) **A refuelable zinc/air battery for fleet electric vehicle propulsion.** Cooper, J.F.; Fleming, D.; Hargrove, D.; Koopman, R.; Peterman, K. Lawrence Livermore National Lab., CA (United States). 20 Apr 1995. 11p. Sponsored by USDOE, Washington, DC (United States);Department of Transportation, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950857–2: Society of Automotive Engineers future transportation technology conference and exposition, Costa Mesa, CA (United States), 7-10 Aug 1995). Order Number DE95013263. Source: OSTI; NTIS; GPO Dep.

We report the development and on-vehicle testing of an engineering prototype zinc/air battery. The battery is refueled by periodic exchange of spent electrolyte for zinc particles entrained in fresh electrolyte. The technology is intended to provide a capability for nearly continuous vehicle operation, using the fleet s home base for 10 minute refuelings and zinc recycling instead of commercial infrastructure. In the battery, the zinc fuel particles are stored in hoppers, from which they are gravity fed into individual cells and completely consumed during discharge. A six-celled (7V) engineering prototype battery was combined with a 6 V lead/acid battery to form a parallel hybrid unit, which was tested in series with the 216 V battery of an electric shuttle bus over a 75 mile circuit. The battery has an energy density of 140 Wh/kg and a mass density of 1.5 kg/L. Cost, energy efficiency, and alternative hybrid configurations are discussed.

23817 (CONF-9410309–5) **Advanced computational research in materials processing for design and manufacturing.** Zacharia, T. (Oak Ridge National Lab., TN (United States). Metals and Ceramics). Oak Ridge National Lab., TN (United States). [1994]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Contractor's coordination meeting; Dearborn, MI (United States); 24-27 Oct 1994. Order Number DE95013355. Source: OSTI; NTIS; GPO Dep.

The computational requirements for design and manufacture of automotive components have seen dramatic increases for producing automobiles with three times the mileage. Automotive component design systems are becoming increasingly reliant on structural analysis requiring both overall larger analysis and more complex analyses, more three-dimensional analyses, larger model sizes, and routine consideration of transient and non-linear effects. Such analyses must be performed rapidly to minimize delays in the design and development process, which drives the need for parallel computing. This paper briefly describes advanced computational research in superplastic forming and automotive crash worthiness.

3307 Emission Control

23818 (UCRL-JC–120646) **Radical oxidation automotive de-NO_x.** Chang, B.; Garcia, M. Lawrence Livermore National Lab., CA (United States). May 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950875–2: International symposium on plasma chemistry, Minneapolis, MN (United States), 21-25 Aug 1995). Order Number DE95013451. Source: OSTI; NTIS; GPO Dep.

The authors describe an experiment to remove NO_x from air-like gas flows by optimizing its oxidation to nitric acid. Their aim is to demonstrate an efficient de-NO_x process that can replace the catalytic converter of today's automobiles and recover greater engine performance. NO is oxidized to HNO_3 by injecting O_3 from an auxiliary air discharge unit, and the acid is scrubbed by a granular NaOH filter, the final product being $NaNO_3$. In theory this scheme requires less engine power than the enthalpy loss through the catalytic converter, and permits engine operation with oxygen-rich fuel mixtures at high compression ratios for peak thermodynamic efficiency. Experiments utilize a glass tube flow reactor with a 20 liter/minute flow mixed from the separate injections of compressed ozonized air and an admixture of 200 ppm of NO in nitrogen from a small pressurized bottle, for net proportions of 89% N_2, 11% O_2, 120 ppm NO. Ozone concentration is selected by adjusting the frequency of the repetitive-pulsed coaxial-barrier air discharge cell. For O_3:NO ratios greater than unity a chain of reactions successively produce NO_2, NO_3, and N_2O_5 which then combines with ambient H_2O to form HNO_3. The overall efficiency is dominated by the electrical efficiency of the ozonizer, at present about 30 eV/O_3 within the discharge.

3308 Alternative Fuels

23819 (CONF-9504160–5) **Hydrogen fuel dispensing station for transportation vehicles.** Singh, S.P.N. (Oak Ridge National Lab., TN (United States). Chemical Technology Div.); Richmond, A.A. Oak Ridge National Lab., TN (United States). [1995]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1995 DOE/NREL hydrogen program review; Coral Gables, FL (United States); 18-21 Apr 1995. Order Number DE95014271. Source: OSTI; NTIS; GPO Dep.

A technical and economic assessment is being conducted of a hydrogen fuel dispensing station to develop an understanding of the infrastructure requirements for supplying hydrogen fuel for mobile applications. The study includes a process design of a conceptual small-scale, stand-alone, grassroots fuel dispensing facility (similar to the present-day gasoline stations) producing hydrogen by steam reforming of natural gas. Other hydrogen production processes (such as partial oxidation of hydrocarbons and water electrolysis) were reviewed to determine their suitability for manufacturing the hydrogen. The study includes an assessment of the environmental and other regulatory permitting requirements likely to be imposed on a hydrogen fuel dispensing station for transportation vehicles. The assessment concludes that a dispensing station designed to produce 0.75 million standard cubic feet of fuel grade (99.99%+ purity) hydrogen will meet the fuel needs of 300 light-duty vehicles per day. Preliminary economics place the total capital investment (in 1994 US dollars) for the dispensing station at $4.5 million and the annual operating costs at around $1 million. A discounted cash-flow analysis indicates that the fuel hydrogen product price (excluding taxes) to range between $1.37 to $2.31 per pound of hydrogen, depending upon the natural gas price, the plant financing scenario, and the rate of return on equity capital. A report on the assessment is due in June 1995. This paper presents a summary of the current status of the assessment.

23820 (NREL/TP–425-6550) **Evaluation of aftermarket CNG conversion kits in light-duty vehicle applications. Final report.** Blazek, C.F. (Institute of Gas Technology, Chicago, IL (United States)); Rowley, P.F.; Grimes, J.W. National Renewable Energy Lab., Golden, CO (United States). Jul 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE94006893. Source: OSTI; NTIS; GPO Dep.

The Institute of Gas Technology (IGT) was contracted by the National Renewable Energy Laboratory (NREL) to evaluate three compressed natural gas (CNG) conversion systems using a 1993 Chevrolet Lumina baseline vehicle. A fourth conversion system was added to the test matrix through funding support from Brooklyn Union. The objective of this project was to measure the Federal Test Procedure (FTP) emissions and fuel economy of the different conversion systems, and to compare the performance to gasoline-fueled operation and each other. Different natural gas compositions were selected to represent the 10th percentile, mean, and 90th percentile compositions distributed in the Continental United States. Testing with these different compositions demonstrated the systems' ability to accommodate the spectrum of gas found in the United States. Each compressed natural gas conversion system was installed and adjusted according to the manufacturer's instructions. In addition to the FTP testing, an evaluation of the comparative installation times and derivability tests (based on AGA and CRC guidelines) were conducted on each system.

Center for Environmental Research and Technology. Jul 1995. 121p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95009224. Source: OSTI; NTIS; GPO Dep.

During the past two decades there has been a considerable effort in the US to develop and introduce an alternative to the use of gasoline and conventional diesel fuel for transportation. The primary motives for this effort have been twofold: energy security and improvement in air quality, most notably ozone, or smog. The anticipated improvement in air quality is associated with a decrease in the atmospheric reactivity, and sometimes a decrease in the mass emission rate, of the organic gas and NO_x emissions from alternative fuels when compared to conventional transportation fuels. Quantification of these air quality impacts is a prerequisite to decisions on adopting alternative fuels. The purpose of this report is to present a critical review of the procedures and data base used to assess the impact on ambient air quality of mobile source emissions from alternative and conventional transportation fuels and to make recommendations as to how this process can be improved. Alternative transportation fuels are defined as methanol, ethanol, CNG, LPG, and reformulated gasoline. Most of the discussion centers on light-duty AFVs operating on these fuels. Other advanced transportation technologies and fuels such as hydrogen, electric vehicles, and fuel cells, will not be discussed. However, the issues raised herein can also be applied to these technologies and other classes of vehicles, such as heavy-duty diesels (HDDs). An evaluation of the overall impact of AFVs on society requires consideration of a number of complex issues. It involves the development of new vehicle technology associated with engines, fuel systems, and emission control technology; the implementation of the necessary fuel infrastructure; and an appropriate understanding of the economic, health, safety, and environmental impacts associated with the use of these fuels. This report addresses the steps necessary to properly evaluate the impact of AFVs on ozone air quality.

23822 (NREL/TP–425-7618) **Hardware assembly and prototype testing for the development of a dedicated liquefied propane gas ultra low emission vehicle.** National Renewable Energy Lab., Golden, CO (United States); IMPCO Technologies, Seattle, WA (United States). Jul 1995. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95009250. Source: OSTI; NTIS; GPO Dep.

On February 3, 1994, IMPCO Technologies, Inc. started the development of a dedicated LPG Ultra Low Emissions Vehicle (ULEV) under contract to the Midwest Research Institute National Renewable Energy Laboratory Division (NREL). The objective was to develop a dedicated propane vehicle that would meet or exceed the California ULEV emissions standards. The project is broken into four phases to be performed over a two year period. The four phases of the project include: (Phase 1) system design, (Phase 2) prototype hardware assembly and testing, (Phase 3) full-scale systems testing and integration, (Phase 4) vehicle demonstration. This report describes the approach taken for the development of the vehicle and the work performed through the completion of Phase II dynamometer test results. Work was started on Phase 2 (Hardware Assembly and Prototype Testing) in May 1994 prior to completion of Phase 1 to ensure that long lead items would be available in a timely fashion for the Phase 2 work. In addition, the construction and testing of the interim electronic control module (ECM), which was used to test components, was begun prior to the formal start of Phase 2. This was done so that the shortened revised schedule for the project (24 months) could be met. In this report, a brief summary of the activities of each combined Phase 1 and 2 tasks will be presented, as well as project management activities. A technical review of the system is also given, along with test results and analysis. During the course of Phase 2 activities, IMPCO staff also had the opportunity to conduct cold start performance tests of the injectors. The additional test data was most positive and will be briefly summarized in this report.

23823 (NREL/TP–425-7629) **Inspection of compressed natural gas cylinders on school buses.** National Renewable Energy Lab., Golden, CO (United States); Acurex Environmental Corp., Mountain View, CA (United States). Jul 1995. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95009231. Source: OSTI; NTIS; GPO Dep.

The US Department of Energy (DOE) is sponsoring compressed natural gas (CNF)-powered school bus demonstrations in various locations around the country. Early in 1994, two non-DOE-sponsored CNG pickup trucks equipped with composite-reinforced-aluminum fuel cylinders experienced cylinder ruptures during refueling. As reported by the Gas Research Institute (GRI): ...analysis of the cylinder ruptures on the pickup trucks revealed that they were due to acid-induced stress corrosion cracking (SCC) of the overwrap. The overwrap that GRI refers to is a resin-impregnated fiber that is wrapped around the outside of the gas

cylinder for added strength. Because ensuring the safety of the CNG vehicles it sponsors is of paramount concern to DOE, the Department, through the National Renewable Energy Laboratory (NREL), conducted inspections of DOE-sponsored vehicles nationwide. The work had three objectives: inspection, documentation, and education. First, inspectors visited sites where CNG-powered school buses sponsored by DOE are based, and inspected the CNG cylinders for damage. Second, information learned during the inspections was collected for DOE. Third, the inspections found that the education and awareness of site personnel, in terms of cylinder damage detection, needed to be increased.

23824 (UCRL-JC–120152) **A smooth transition to hydrogen transportation fuel.** Berry, G.D.; Smith, J.R.; Schock, R.N. Lawrence Livermore National Lab., CA (United States). 14 Apr 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9504160–4: 1995 DOE/NREL hydrogen program review, Coral Gables, FL (United States), 18-21 Apr 1995). Order Number DE95014391. Source: OSTI; NTIS; GPO Dep.

The goal of this work is to examine viable near-term infrastructure options for a transition to hydrogen fueled vehicles and to suggest profitable directions for technology development. The authors have focused in particular on the contrasting options of decentralized production using the existing energy distribution network, and centralized production of hydrogen with a large-scale infrastructure. Delivered costs have been estimated using best available industry cost and deliberately conservative economic assumptions. The sensitivities of these costs have then been examined for three small-scale scenarios: (1) electrolysis at the home for one car, and production at the small station scale (300 cars/day), (2) conventional alkaline electrolysis and (3) steam reforming of natural gas. All scenarios assume fueling a 300 mile range vehicle with 3.75 kg. They conclude that a transition appears plausible, using existing energy distribution systems, with home electrolysis providing fuel costing 7.5 to 10.5¢/mile, station electrolysis 4.7 to 7.1¢/mile, and steam reforming 3.7 to 4.7¢/mile. The average car today costs about 6¢/mile to fuel. Furthermore, analysis of liquid hydrogen delivered locally by truck from central processing plants can also be competitive at costs as low as 4¢/mile. These delivered costs are equal to $30 to $70 per GJ, LHV. Preliminary analysis indicates that electricity transmission costs favor this method of distributing energy, until very large (10 GW) hydrogen pipelines are installed. This indicates that significant hydrogen pipeline distribution will be established only when significant markets have developed.

23825 (ANL/DIS/CP–86453) **Legal aspects of national implementation of the Chemical Weapons Convention national authority provisions. Workshop I: The National Authority.** Tanzman, E.A. (Argonne National Lab., IL (United States)); Kellman, B. Argonne National Lab., IL (United States). 9 May 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9505207–3: Regional seminar on the national implementation of the chemical weapons convention, Yamoussoukro (South Africa), 9 May 1995). Order Number DE95011827. Source: OSTI; NTIS; GPO Dep.

This seminar is an excellent opportunity for all attendees to learn from each other about how the Chemical Weapons Convention (CWC) can become a foundation of arms control in Africa and around the world. The author discusses legal aspects of implementing the CWC's national authority provisions. These implementing measures are universal, applying not only to the few States Parties that will declare and destroy chemical weapons, but also to the many States Parties that have never had a chemical weapons programme. This new need for national measures to implement multilateral arms control agreements has generated unease due to a perception that implementation may be burdensome and at odds with national law. In 1993, concerns arose that the complexity of integrating the treaty with national law would cause each nation to effectuate the Convention without regard to what other nations were doing, thereby engendering significant disparities in implementation steps among States Parties. As a result, the author prepared the Manual for National Implementation of the Chemical Weapons Convention late last year and presented it to each national delegation at the December 1993 meeting of the Preparatory Commission in The Hague. Here the author discusses progress among several States in actually developing implementing measures for the Convention's national authority requirements. CWC legislation from Australia, Germany, Norway, South Africa, and Sweden were available at this writing in English through the PTS. Of course, it is important to note that this brief survey necessarily omitted examination of the existing "background" of other, related domestic laws that these signatories might also have adopted that affect CWC implementation. The author hopes that his brief review will give delegations a flavor of the choices that exist for national implementation of the CWC.

23826 (DOE/EIS–0218D-Vol.2-App.F) **Draft environmental impact statement on a proposed nuclear weapons nonproliferation policy concerning foreign research reactor spent nuclear fuel: Volume 2, Appendix F, Description and impacts of storage technology alternatives.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Mar 1995. 326p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012343. Source: OSTI; NTIS; INIS; GPO Dep.

This appendix presents a description and evaluation of currently available spent nuclear fuel storage technologies, and their applicability to foreign research reactor spent nuclear fuel. These technologies represent the range of alternatives dW would be available to implement the proposed action. Some of these technologies are currently in use at US Department of Energy (DOE) facilities. Several dry storage cask and/or building designs have been licensed by the US Nuclear Regulatory Commission (NRC) and are operational with commercial nuclear power plant spent fuel at several locations. This appendix also discusses potential storage sites and impacts of foreign research reactor spent nuclear fuel storage at these locations.

3502 Proliferation

23827 (DOE/EA–0971) **Environmental assessment for device assembly facility operations, Nevada Test Site, Nye County, Nevada. Final report.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). May 1995. 39p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95014001. Source: OSTI; NTIS; GPO Dep.

The U.S. Department of Energy, Nevada Operations Office (DOE/NV), has prepared an environmental assessment (EA), (DOE/EA-0971), to evaluate the impacts of consolidating all nuclear explosive operations at the newly constructed Device Assembly Facility (DAF) in Area 6 of the Nevada Test Site. These operations generally include assembly, disassembly or modification, staging, transportation, testing, maintenance, repair, retrofit, and surveillance. Such operations have previously been conducted at the Nevada Test Site in older facilities located in Area 27. The DAF will provide enhanced capabilities in a state-of-the-art facility for the safe, secure, and efficient handling of high explosives in combination with special nuclear materials (plutonium and highly enriched uranium). Based on the information and analyses in the EA, DOE has determined that the proposed action would not constitute a major federal action significantly affecting the quality of the human environment within the meaning of the National Environmental Policy Act of 1969 (42 U.S.C. 4321 et seq.). Therefore, an environmental impact statement is not required, and DOE is issuing this finding of no significant impact.

23828 (GAO/RCED–94-119) **Nuclear nonproliferation: Concerns with US delays in accepting foregin research reactors' spent fuel.** USDOE, Washington, DC (United States). 25 Mar

1994. 28p. Sponsored by General Accounting Office, Washington, DC (United States). Order Number DE95015118. Source: OSTI; NTIS; INIS.

One key US nonproliferation goal is to discourage use of highly enriched uranium fuel (HEU), which can be used to make nuclear bombs, in civilian nuclear programs worldwide. DOE's Off-Site Fuels Policy for taking back spent HEU from foreign research reactors was allowed to expire due to environmental reasons. This report provides information on the effects of delays in renewing the Off-Site Fuels Policy on US nonproliferation goals and programs (specifically the reduced enrichment program), DOE's efforts to renew the fuels policy, and the price to be charged to the operators of foreign reactors for DOE's activities in taking back spent fuel.

3503 Verification

23829 (BNL–61395) **MACS as a tool for international inspections.** Curtiss, J.A.; Indusi, J.P. Brookhaven National Lab., Upton, NY (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States);Defense Nuclear Agency, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950787–3: 36. annual meeting of the Institute for Nuclear Materials Management, Palm Desert, CA (United States), 9-12 Jul 1995). Order Number DE95013318. Source: OSTI; NTIS; INIS; GPO Dep.

General acceptance of the challenge provision in the Chemical Weapons Convention has the potential for influence in other arms control areas. While most applications of the challenge inspection may be straightforward, there may be instances where access to the site by inspectors may be problematic. The MACS system described in this paper was developed to respond to these situations. Inspection and verification may be difficult when a host is unwilling,for valid reasons, to permit physical access to a site. We proposed a system of remote sensors which may be used to demonstrate compliance with Chemical Weapons Convention (CWC) challenge inspections even ff the inspector is physically excluded from a sensitive site. The system is based upon alternative-means-of-access provisions of the CWC. The Defense Nuclear Agency (DNA) funded design and construction of a system prototype, designated as MACS for Managed Access by Controlled Sensing. Features of the MACS design allow growth of the prototype into a versatile device for international monitoring of production facilities and other sites. MACS consists of instrumentation and communication equipment allowing site personnel to conduct a facility tour and perform acceptable measurements, while physically excluding the inspector from the facility. MACS consists of a base station used by the inspector, and a mobile unit used within the facility and manipulated by the facility staff. The base station and the mobile unit are @ed by a communication system, currently realized as a fiber optic cable. The mobile unit is equipped with television cameras and remote-reading distance-measuring equipment (DME) for use in verifying locations and dimensions. Global Positioning System receivers on the mobile unit provide both precise location and dead reckoning, suitable for tracking the mobile unit's position while within a building when satellite signals are not available.

23830 (UCRL-ID–120947) **Status report on source properties important for discrimination.** Glenn, L.A. Lawrence Livermore National Lab., CA (United States). Mar 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015126. Source: OSTI; NTIS; GPO Dep.

To begin, we need to discuss what is meant by source properties important for discrimination. Here we are concerned primarily with discriminating earthquakes from explosions by seismic means. We do not distinguish between chemical and nuclear explosions because, for concentrated explosions, these will appear identical except for a factor of two or so in the long-period amplitude (which will not be identifiable at a distant seismic station). Ripple-fired chemical explosions may, in theory, be distinguished from concentrated explosions by the spectral modulation that is produced by the former, however we specifically exclude spatio-temporal organization and other geometric effects and concentrate on material properties that have important influence on characteristics of the seismic signal which might allow explosions to be distinguished from earthquakes. The most prominent of these are the corner frequency of the seismic spectrum, the high-frequency roll-off, and the long-period overshoot. Both quasi-analytical[1] methods and finite difference numerical solutions of the hydro-dynamic equations 1-6 were used to explore the effects of the: (1) equation of state of the explosion products; (2) equation of state of the rock media surrounding the explosion; (3) energy and mass density of the explosion source; (4) constitutive properties of the surrounding rock media, including: (a) compressive and tensile strength; (b) porosity; (c) dilatancy; and (d) elastic moduli; and (5) depth of burial (lithostatic overburden). The calculations performed thus far assumed one-dimensional radial symmetry for the most part so that, in addition to geometric details of the source excluded from consideration, depth effects on spall are excluded as well. For our analysis we have chosen models that offer a wide range of parametric behavior and also that have generally given good agreement with experiment.

23831 (ANL/ES/CP–84366) **Calcium metal as a scavenger for antimony from aluminum alloys.** Bonsignore, P.V.; Daniels, E.J.; Wu, C.T. Argonne National Lab., IL (United States). 4 Oct 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950201–17: Annual meeting and exhibition of the Minerals, Metals and Materials Society (TMS), Las Vegas, NV (United States), 12-16 Feb 1995). Order Number DE95012290. Source: OSTI; NTIS; GPO Dep.

Previous work has shown that trace amounts of antimony (Sb) can affect the mechanical properties of strontium (Sr) modified aluminum castings. ANL has been investigating technology to remove or neutralize Sb to reduce its negative effect on the physical properties of those alloys. Review of past work on processing and recovery of scrap aluminum inferred that calcium (Ca) is an effective scavenger of Sb, bismuth, lead and cadmium. Following up on that lead, we have found that Ca is, indeed, effective for removing Sb from molten aluminum alloys although its effectiveness can be compromised by a wide range of processing conditions. A minimum ratio of about four to one, by weight, of Ca to Sb appears necessary to insure an effective scavenging of contained Sb.in 356 aluminum alloys.

23832 (ANL/ET/CP–86147) **Mechanically reliable surface oxides for high-temperature corrosion resistance.** Natesan, K.; Veal, B.W.; Grimsditch, M.; Renusch, D.; Paulikas, A.P. Argonne National Lab., IL (United States). May 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9505204–2: 9, annual conference on fossil energy materials, Oak Ridge, TN (United States), 16-18 May 1995). Order Number DE95013531. Source: OSTI; NTIS; GPO Dep.

Corrosion is widely recognized as being important, but an understanding of the underlying phenomena involves factors such as the chemistry and physics of early stages of oxidation, chemistry and bonding at the substrate/oxide interface, role of segregants on the strength of that bond, transport processes through scale, mechanisms of residual stress generation and relief, and fracture behavior at the oxide/substrate interface. Because of this complexity a multilaboratory program has been initiated under the auspices of the DOE Center of Excellence for the Synthesis and Processing of Advanced Materials, with strong interactions and cross-leveraging with DOE Fossil Energy and US industry. Objective is to systematically generate the knowledge required to establish a scientific basis for designing and synthesizing improved protective

oxide scales/coatings (slow-growing, adherent, sound) on high-temperature materials without compromising the requisite properties of the bulk materials. The objectives of program work at Argonne are to (1) correlate actual corrosion performance with stresses, voids, segregants, interface roughness, initial stages of oxidation, and microstructures; (2) study such behavior in growing or as-grown films; and (3) define prescriptive design and synthesis routes to mechanically reliable surface oxides. Several techniques, such as Auger electron spectroscopy, X-ray diffraction, X-ray grazing incidence reflectance, grazing-angle X-ray fluorescence, optical fluorescence, and Raman spectroscopy, are used in the studies. Tne project has selected Fe-25 wt.% Cr-20 wt.% Ni and Fe-Cr-Al alloys, which are chromia- and alumina-formers respectively, for the studies. This paper presents some of the results on early stages of oxidation and on surface segregation of elements.

23833 (ANL-HEP-TR–95-32) **Travel to Steel Warehouse Inc., Southbend, Indiana. Trip report, May 4, 1995.** Hill, N.F. (Argonne National Lab., IL (United States). High Energy Physics Div.). Argonne National Lab., IL (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95013744. Source: OSTI; NTIS; INIS; GPO Dep.

On May 4, 1995 the author visited a steel plate and coil, cold reduction facility at Steel Warehouse Inc. located in South Bend, Indiana about 150 miles from Argonne. Some very interesting facts were learned about cold reduction of hot rolled steel during this visit. The company selected is only a cold reduction mill and buys steel from a number of steel producers. The author spent a total of about three hours with these people, and this included a tour of their pickling line, the small cold reduction mill which at present is limited to 15.5 in width maximum, and their large cold reduction mill which produces sheet and coil up to 72 in. wide. Some of the things that were learned, that will have an impact on the production of the Atlas steel plates are given here. (1) Hot rolled coils have some inherent, interesting, characteristics that must be taken into consideration when being cold reduced. (2) The monitoring of the coil thickness is only done along the center line of the coil, this has a serious impact on QC of plates cut from this coil for a number of reasons. (3) Hot rolled coils of steel in this particular instance may come from a number of different sources. This could cause problems if magnetic permeability is a serious issue. It was the author's impression that this facility is fairly typical of what one might expect from any similar facility.

23834 (ANL/MSD/CP–83449) **Grain size dependent mechanical properties in nanophase materials.** Siegel, R.W. (Argonne National Lab., IL (United States)); Fougere, G.E. Argonne National Lab., IL (United States). Feb 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38 ; FG02-86ER45229. (CONF-941144–150: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95012400. Source: OSTI; NTIS; GPO Dep.

It has become possible in recent years to synthesize metals and ceramics under well controlled conditions with constituent grain structures on a manometer size scale (below 100 nm). These new materials have mechanical properties that are strongly grain-size dependent and often significantly different than those of their coarser grained counterparts. Nanophase metals tend to become stronger and ceramics are more easily deformed as grain size is reduced. The observed mechanical property changes appear to be related primarily to grain size limitations and the large percentage of atoms in grain boundary environments. A brief overview of our present knowledge about the grain-size dependent mechanical properties of nanophase materials is presented.

23835 (ANL/XFD/CP–83323) **Magnetic Compton scattering studies of the Invar alloy Fe_3Pt.** Yahnke, C.J.; Srajer, G.; Haeffner, D.R.; Mills, D.M.; Assoufid, L. Argonne National Lab., IL (United States). Feb 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9411234–1: Applications of synchrotron radiation techniques to materials science, Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95013385. Source: OSTI; NTIS; GPO Dep.

The magnetic Compton profiles (MCP) for both ordered and disordered Fe_3Pt samples have been measured above and below their Curie temperature. These measurements show that the average moment per atom at room temperature is $2.8\mu_B \pm 0.1\mu_B$ for disordered Fe_3Pt and $1.8\mu_B \pm 0.1\mu_B$ for ordered Fe_3Pt., At temperatures above T_c, we measured a substantial reduction in the moment ($0.6\mu_B \pm 0.1\mu_B$ for disordered Fe_3Pt and $0.6\mu_B \pm 0.1\mu_B$ for ordered Fe_3Pt) and a change in the shape of the MCP. These results indicate a decrease of the d-like moment on the Fe atoms in the disordered phase. The MCP for the ordered phase shows a change in the total moment, yet the momentum distribution is substantially different and cannot be described by this analysis.

23836 (BNL–61673) **A Scanning Auger Microprobe analysis of corrosion products associated with sulfate reducing bacteria.** Sadowski, R.A. (State Univ. of New York, Stony Brook, NY (United States). Dept. of Materials Science and Engineering); Chen, G.; Clayton, C.R.; Kearns, J.R.; Gillow, J.B.; Francis, A.J. Brookhaven National Lab., Upton, NY (United States). Mar 1995. 13p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract AC02-76CH00016. Contract N0001485K0437. (CONF-950304–15: Corrosion '95: National Association of Corrosion Engineers (NACE) international annual conference and corrosion show, Orlando, FL (United States), 26-31 Mar 1995). Order Number DE95011780. Source: OSTI; NTIS; GPO Dep.

A Scanning Auger Microprobe analysis was performed on the corrosion products of an austenitic AISI type 304 SS after a potentiostatic polarization of one volt for ten minutes in a modified Postgate's C media containing sulfate reducing bacteria. The corrosion products were characterized and mapped in local regions where pitting was observed. A critical evaluation of the applicability of this technique for the examination of microbially influenced corrosion (MIC) is presented.

23837 (CONF-941016–7) **Fracture behavior of Cr_2Nb-based intermetallics.** Cook, J.A. (Univ. of Tennessee, Knoxville, TN (United States). Dept. of Materials Science and Engineering); Liaw, P.K.; Liu, C.T. Oak Ridge National Lab., TN (United States). [1994]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Materials week '94; Rosemont, IL (United States); 3-7 Oct 1994. Order Number DE95013223. Source: OSTI; NTIS; GPO Dep.

Microstructural evaluations and mechanical testing of Laves-phase alloys based on Cr_2Nb were examined in order to determine phase relationships with heat treating temperatures up to 1,600 C. At ambient temperatures, single-phase Cr_2Nb alloys are very hard and brittle due to the complicated crystal structure (C-15). The following results were revealed through examination of the Cr-Cr_2Nb two-phase region: (a) with increasing amounts of the soft chromium-rich phase, the compression strength and hardness decrease; (b) the annealing treatments studied provided the best break-up of the brittle Laves-containing eutectic phase in the 94 at.% Cr-6 at.% Nb (CN-7) alloy; (c) annealing for 1 hour at 1,600 C + 4 hours at 1,200 C drastically improved the room temperature strength and compressive ductility over previous annealing treatments. Previous studies have shown that the introduction of a soft chromium phase has promising effects in improving the mechanical properties of brittle Cr_2Nb Laves-phase alloys.

23838 (CONF-941144–159) **Some unusal properties of the fine structure of dislocations in Ni_3Al deformed at high temperature.** Veyssiere, P. (Office National d'Etudes et de Recherches Aerospatiales (ONERA), 92 - Chatillon (France)); Horton, J.A. Oak Ridge National Lab., TN (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1994 fall meeting of the Materials Research Society (MRS); Boston, MA (United States); 28 Nov - 2 dec 1994. Order Number DE95013226. Source: OSTI; NTIS; GPO Dep.

In Ni_3Al polycrystals deformed at 850°C and quenched rapidly, surface defects exhibit two kinds of behaviour. On the one hand, dislocation coupling by antiphase boundary (APB) and complex stacking fault (CSF) is of normal magnitude for this alloy composition. On the other hand, separations are dramatically decreased in both cases. A method to visualize antiphase boundaries using a weakly excited superlattice reflection is introduced.

23839 (CONF-950201–19) **Room and elevated temperature mechanical properties of PM TiAl alloy Ti-47Al-2Cr-2Nb.** Liu, C.T. (Oak Ridge National Lab., TN (United States)); Maziasz, P.J.; Schneibel, J.H.; Sikka, V.K.; Wright, J.; Walker, L.R.; Clemens, D.R.; Nieh, T.G. Oak Ridge National Lab., TN (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ; W-7405-ENG-48. From Annual meeting and exhibition of the Minerals, Metals and Materials Society (TMS); Las Vegas, NV (United States); 12-16 Feb 1995. Order Number DE95014993. Source: OSTI; NTIS; GPO Dep.

A TiAl alloy powder with the composition Ti-47Al-2Cr-2Nb (at. %) was prepared by rotary atomization, followed by hot-extrusion and subsequent heat treatments to produce refined lamellar structures and fine duplex structures. The mechanical properties of the TiM alloy were determined at temperatures to 1000C in air, and the microstructures were characterized by TEM, SEM, and electron microprobe analyses. The alloy with the refined lamellar structure showed excellent mechanical properties at both room and elevated temperatures. It exhibited a plastic strain of 1.4% and a yield strength of 971 MPa (140.9 ksi) at room temperature. The yield strength remained approximately constant up to 800C and decreased to 577 MPa (83.7 ksi) at 1000C. The transverse fracture toughness, estimated by three-point bend testing of chevron-notched specimens at room temperature, was 22.4 MPa $\sqrt{m}$. The refined lamellar structure contained long and straight alternating α_2 and γ platelets with an extremely fine interlamellar spacing (0.1 μm) and α_2-to-α_2 spacing (0.22 μm). The mechanical properties of the alloy have been correlated with the unique microstructures developed by hot extrusion.

23840 (CONF-9502109–1) **Time-dependent stress concentration and microcrack nucleation in TiAl.** Yoo, M.H. Oak Ridge National Lab., TN (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States);Alexander von Humboldt-Stiftung, Bonn (Germany). DOE Contract AC05-84OR21400. From International symposium on gamma titanium aluminides (ISGTA-95); Las Vegas, NV (United States); 12 Feb - 16 mar 1995. Order Number DE95014268. Source: OSTI; NTIS; GPO Dep.

Localized stress evolution associated with the interaction of slip or twinning with an interface is treated by means of a superposition of the "internal loading" of a crystalline subsystem by dynamic dislocation pile-up and the stress relaxation by climb of interfacial dislocations. The peak value of a stress concentration factor depends on both the angular function that includes the effect of mode mixity and the ratio of characteristic times for stress relaxation and internal loading. The available experimental data on orientation and strain-rate dependences of interfacial fracture mode in polysynthetically twinned TiAl crystals are discussed in view of the theoretical concepts presented in this paper.

23841 (CONF-950412–22) **Collisional effects of background gases on pulsed laser deposition plasma beams.** Geohegan, D.B. (Oak Ridge National Lab., TN (United States)); Puretzky, A.A. Oak Ridge National Lab., TN (United States). Apr 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Spring meeting of the Materials Research Society (MRS); San Francisco, CA (United States); 17-21 Apr 1995. Order Number DE95013986. Source: OSTI; NTIS; GPO Dep.

The penetration of energetic pulsed ablation plumes through ambient gases is experimentally characterized to investigate a general phenomenon believed to be important to film growth by pulsed laser deposition (PLD). Under typical PLD conditions involving background gases, the ion flux in the ablation plume is observed to split into distinct fast and slow components over a limited range of distances. The fast component is transmitted with near-initial velocities and high kinetic energies, potentially damaging to growing films at these distances. Formation of the second, significantly-slowed component correlates with the bright contact front formation observed in fast ICCD imaging studies. This general effect is explored in detail for the case of yttrium ablation into argon, a single-element target into an inert gas. Time-resolved optical absorption spectroscopy and optical emission spectroscopy are employed to simultaneously view the populations of both excited and ground states of Y and Y^+ for comparison with quantitative intensified-CCD photography of the visible plume luminescence and ion flux measurements made with fast ion probes during this phenomenon. These measurements confirm that, in addition to the bright significantly-slowed front which has been described by shock or drag propagation models, a fast-component of target material is transmitted to extended distances for some ambient pressures with near-initial velocities.

23842 (CONF-950412–23) **Laser-solid interaction and dynamics of the laser-ablated materials.** Chen, K.R.; Leboeuf, J.N.; Geohegan, D.B.; Wood, R.F.; Donato, J.M.; Liu, C.L.; Puretzky, A.A. Oak Ridge National Lab., TN (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States);Oak Ridge Inst. for Science and Education, TN (United States). DOE Contract AC05-84OR21400. From Spring meeting of the Materials Research Society (MRS); San Francisco, CA (United States); 17-21 Apr 1995. Order Number DE95014199. Source: OSTI; NTIS; INIS; GPO Dep.

Rapid transformations through the liquid and vapor phases induced by laser-solid interactions are described by the authors' thermal model with the Clausius-Clapeyron equation to determine the vaporization temperature under different surface pressure condition. Hydrodynamic behavior of the vapor during and after ablation is described by gas dynamic equations. These two models are coupled. Modeling results show that lower background pressure results lower laser energy density threshold for vaporization. The ablation rate and the amount of materials removed are proportional to the laser energy density above its threshold. The authors also demonstrate a dynamic source effect that accelerates the unsteady expansion of laser-ablated material in the direction perpendicular to the solid. A dynamic partial ionization effect is studied as well. A self-similar theory shows that the maximum expansion velocity is proportional to $c_s\alpha$, where $1 - \alpha$ is the slope of the velocity profile. Numerical hydrodynamic modeling is in good agreement with the theory. With these effects, α is reduced. Therefore, the expansion front velocity is significantly higher than that from conventional models. The results are consistent with experiments. They further study how the plume propagates in high background gas condition. Under appropriate conditions, the plume is slowed down, separates with the background, is backward moving, and hits the solid surface. Then, it splits into two parts when it rebounds from the surface. The results from the modeling will be compared with experimental observations where possible.

23843 (CONF-9504176–1) **Structure and composition of clean and hydrogen covered MoRe surfaces.** Hammer, L. (and others); Meyer, S.; Rath, C. Oak Ridge National Lab., TN (United States). Apr 1995. 8p. Sponsored by USDOE, Washington, DC (United States);Deutsche Forschungsgemeinschaft, Bonn (Germany). DOE Contract AC05-84OR21400. From Surface science '95 symposium; Kizsteinhorn/Kaprun (Austria); 23-29 Apr 1995. Order Number DE95013992. Source: OSTI; NTIS; GPO Dep.

The clean and hydrogen covered (100) and (110) faces of $Mo_{0.75}Re_{0.23}$ alloy single crystals show 1x1 structures. By means of LEED structure analyses we have determined the interlayer distances as well as the layer concentrations down to the sixth layer. While the clean (110) surface turns out to be nearly bulklike terminated, the clean (100) face is found to exhibit both an extended oscillatory layer relaxation and composition profile. Hydrogen adsorption at low temperatures does not alter the composition profile and removes the small remaining relaxation for the (110) surface. In case of the (100) face a substancial reduction of the relaxation is observed for the outermost layer distances as well, while deeper layer relaxations are preserved indicating a strong coupling off relaxation and composition profiles. Hydrogen is found to adsorb in quasi-threefold coordinated sites for the (110) and bridge sites for the (100) face.

23844 (CONF-9505204–5) **High-temperature corrosion behavior of iron-aluminide alloys and coatings.** Tortorelli, P.F. (Oak Ridge National Lab., TN (United States)); DeVan, J.H.; Pint, B.A.; Wright, I.G.; Saunders, S.R.J. Oak Ridge National Lab., TN (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 9, annual conference on fossil energy materials; Oak Ridge, TN (United States); 16-18 May 1995. Order Number DE95014280. Source: OSTI; NTIS; GPO Dep.

An Fe-28 at.% Al-2% Cr alloy doped with Y_2O_3 showed improved scale adhesion relative to a dispersion-free form of the same composition. However, doping with CeO_2 or La_2O_3 was detrimental to oxidation behavior. A study of weld-overlay iron-aluminide coatings showed that, those with sufficiently high aluminum concentrations had sulfidation resistance in H_2S-H_2-H_2O-Ar at 800 C equivalent to the most resistant bulk iron aluminides. These corrosion-resistant coatings have the potential to be effective barriers in high-temperature sulfidizing environments provided the appropriate combinations of filler metal, process parameters, and substrate are used to produce adequate aluminum concentrations and minimal chromium contents. Exposures in an oxidizing/sulfidizing environment containing varying amounts of HCl at 450 and 550 C showed that Fe_3Al alloys had good corrosion resistance.

23845 (CONF-9506144–7) **Application of damage models in metal forming.** Zhu, Y.Y.; Zacharia, T. Oak Ridge National Lab., TN (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States);Oak Ridge Inst. for Science and Education, TN (United States). DOE Contract AC05-84OR21400. From 5. international conference on numerical methods in industrial forming processes (NUMIFORM); Ithaca, NY (United States); 18-21 Jun 1995. Order Number DE95013221. Source: OSTI; NTIS; GPO Dep.

The development of damage models in the analysis of metal forming processes, to characterize the formability limits, is an important area of ongoing research. In this paper, two energy-based damage models for the simulation of crack initiation in metal forming processes are presented. The first one is an isotropic damage model with two damage variables. The second one is an anisotropic model with a damage characteristic tensor. The damage models are developed within the general framework of continuum thermodynamics for irreversible processes by identifying a proper set of internal variables together with their associated generalized forces. An approach is proposed to account for microcrack opening and closing. A viscoplastic regularization algorithm is used to take into account the strain rate effect and to improve numerical stability. Both models have been incorporated into the finite element code, LAGAMINE. The models were applied to simulations of upsetting of collar cylinders and nonisothermal hemispherical punch stretching. The results of the analyses were validated by comparing the finite element simulations with experimentally obtained data.

23846 (CONF-9506209–1) **Mechanistic modeling of high-temperature ordered intermetallics.** Yoo, M.H. (Technische Universitaet Hamburg-Harburg (Germany)); Fu, C.L. Oak Ridge National Lab., TN (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States);Alexander von Humboldt-Stiftung, Bonn (Germany). DOE Contract AC05-84OR21400. From 2. Pacific Rim international conference on advanced materials and processing (PRICM-2); Kyongju (Korea, Republic of); 18-22 Jun 1995. Order Number DE95014269. Source: OSTI; NTIS; GPO Dep.

Bulk and defect properties and their relationships with mechanical behavior of transition-metal aluminides and silicides are reviewed on the basis of the recent progress in theoretical modeling studies. For Ti_3Al, the structural energy difference between the $L1_2$ and $D0_{19}$ structures was found to be very small, which suggests the possibility of improving ductility through structural modification by ternary additions. While the driving force for the yield strength anomaly in Ni_3Al is believed to stem from the anisotropies of APB energies and crystal elasticity, that for Ni_3Si and $Ni_3(Si,Ti)$ is not understood. Cleavage strength of Ti-rich TiAl is expected to be relatively low because of the deficiency of crack-tip plasticity.

23847 (CONF-950740–66) **Heavy-Section Steel Irradiation Program on irradiation effects in light-water reactor pressure vessel materials.** Nanstad, R.K. (Oak Ridge National Lab., TN (United States). Metals and Ceramics Div.); Corwin, W.R.; Alexander, D.J.; Haggag, F.M.; Iskander, S.K.; McCabe, D.E.; Sokolov, M.A.; Stoller, R.E. Oak Ridge National Lab., TN (United States). [1995]. 15p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. From Joint ASME/JSME pressure vessels and piping conference; Honolulu, HI (United States); 23-27 Jul 1995. Order Number DE95014273. Source: OSTI; NTIS; INIS; GPO Dep.

The safety of commercial light-water nuclear plants is highly dependent on the structural integrity of the reactor pressure vessel (RPV). In the absence of radiation damage to the RPV, fracture of the vessel is difficult to postulate. Exposure to high energy neutrons can result in embrittlement of radiation-sensitive RPV materials. The Heavy-Section Steel Irradiation (HSSI) Program at Oak Ridge National Laboratory, sponsored by the US Nuclear Regulatory Commission (USNRC), is assessing the effects of neutron irradiation on RPV material behavior, especially fracture toughness. The results of these and other studies are used by the USNRC in the evaluation of RPV integrity and regulation of overall nuclear plant safety. In assessing the effects of irradiation, prototypic RPV materials are characterized in the unirradiated condition and exposed to radiation under varying conditions. Mechanical property tests are conducted to provide data which can be used in the development of guidelines for structural integrity evaluations, while metallurgical examinations and mechanistic modeling are performed to improve understanding of the mechanisms responsible for embrittlement. The results of these investigations, in conjunction with results from commercial reactor surveillance programs, are used to develop a methodology for the prediction of radiation effects on RPV materials. This irradiation-induced degradation of the materials can be mitigated by thermal annealing, i.e., heating the RPV to a temperature above that of normal operation. Thus, thermal annealing and evaluation of reirradiation behavior are major tasks of the HSSI Program. This paper describes the HSSI Program activities by summarizing some past and recent results, as well as current and planned studies. 30 refs., 8 figs., 1 tab.

23848 (CONF-950892–7) **Energy-filtered imaging of precipitates in FeCuN alloys.** Rice, P.M. (Oak Ridge National Lab., TN (United States). Metals and Ceramics Div.); Stoller, R.E.; Bentley, J. Oak Ridge National Lab., TN (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States);Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. From 53. annual meeting of Microscopy Society of America; Kansas City, KS (United States); 13-17 Aug 1995. Order Number DE95013038. Source: OSTI; NTIS; GPO Dep.

The microstructures of a series of model ferritic alloys are being characterized by transmission electron microscopy (TEM) techniques. The alloys have varying concentrations of Cu (0 to 0.9 wt%), N (5 to 120 appm), and other solutes to allow a systematic study of the effects of various elements on embrittlement. The first step in this process is the characterization of the alloys in their as-received state: solution treated at 775 C for 17 h, quenched in a salt bath at 450 C for 180 s, and subsequently air cooled. The imaging portion of this initial study is complete; however, several questions about the chemical content of many of the precipitates remain unanswered. To study the affect of Cu precipitation on the hardening of the alloys, a 0.9 wt% Cu alloy was annealed at 550 C for times up to 15 h. The Cu precipitates that form undergo a phase change from bcc to a faulted fcc (9R) crystal structure when they are about 6 nm in diameter. These fcc precipitates have been well characterized by conventional TEM techniques for these alloys. However, the smaller bcc Cu precipitates.

23849 (CONF-9508134–1) **Phase transformations and microstructure development in low alloy steel welds.** Babu, S.S. (and others); David, S.A.; Vitek, J.M. Oak Ridge National Lab., TN (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International symposium on phase transformations during thermal/mechanical processing of steel; Vancouver (Canada); 20-23 Aug 1995. Order Number DE95014284. Source: OSTI; NTIS; GPO Dep.

Microstructure development in low alloy steel welds depends on various phase transformations that are a function of weld heating and cooling. The phase changes include non-metallic oxide inclusion formation in the liquid state, weld pool solidification, and solid state transformations. In this paper the mechanism of inclusion formation during low alloy steel welding is considered and the model predictions are compared with published results. The effect of inclusions on the austenite to ferrite transformation kinetics is measured and the mechanisms of transformation are discussed. The austenite gain development is related to the driving force for transformation of δ ferrite to austenite.

23850 (CONF-9509118–6) **An integrated model for optimizing weld quality.** Zacharia, T. (Oak Ridge National Lab., TN (United States)); Radhakrishnan, B.; Paul, A.J.; Cheng, C. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Modeling of casting, welding and advanced solidification processes 7; London (United Kingdom); 10-15 Sep 1995. Order Number DE95013220. Source: OSTI; NTIS; GPO Dep.

Welding has evolved in the last few decades from almost an empirical art to an activity embodying the most advanced tools of, various basic and applied sciences. Significant progress has been made in understanding the welding process and welded materials. The improved knowledge base has been useful in automation and process control. In view of the large number of variables involved, creating an adequately large database to understand and control the welding process is expensive and time consuming, if not impractical. A recourse is to simulate welding processes through a set of mathematical equations representing the essential physical processes of welding. Results obtained from the phenomenological models depend crucially on the quality of the physical relations in the models and the trustworthiness of input data. In this paper, recent advances in the mathematical modeling of fundamental phenomena in welds are summarized. State of the art mathematical models, advances in computational techniques, emerging high performance computers, and experimental validation techniques have provided significant insight into the fundamental factors that control the development of the weldment. Current status and scientific issues in heat and fluid flow in welds, heat source metal interaction, and solidification microstructure are assessed. Future research areas of major importance for understanding the fundamental phenomena in weld behavior are identified.

23851 (DOE/ER–45529) **Growth induced magnetic anisotropy in amorphous thin films. Annual progress report year 1, November 4, 1994–October 31, 1995.** Hellman, F. (Univ. of California, San Diego, La Jolla, CA (United States). Dept. of Physics). California Univ., San Diego, La Jolla, CA (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-95ER45529. (CONF-950380–2: Annual meeting of the Division of High Polymer Physics of the American Physical Society, San Jose, CA (United States), 20-24 Mar 1995). Order Number DE95015362. Source: OSTI; NTIS; GPO Dep.

The work in the past year has primarily involved three areas of magnetic thin films: amorphous rare earth-transition metal alloys, epitaxial COPt3 thin films, and exchange coupled antiferromagnetic insulators. In the amorphous alloys, the authors have focused on understanding the cause and the effect of the growth-surface-induced perpendicular magnetic anisotropy. Using the results of previous work, they are able to control this anisotropy quite precisely. This anisotropy is predicted to have dramatic and as-yet unobserved effects on the underlying nature of the magnetism. The work on the epitaxial Co-Pt alloys was originally undertaken as a comparison study to the amorphous alloys. The authors have discovered that these alloys exhibit a remarkable new phenomena; a surface-induced miscibility gap in a material which is believed to be completely miscible in the bulk. This miscibility gap is 100% correlated with the perpendicular anisotropy, although the connection is not yet clear, and is presumably linked to a magnetic energy of mixing which tends to drive a material towards clustering. The problem of exchange coupling in multilayers impacts many of the current research areas in magnetism. NiO/CoO multilayers can be prepared with coherent interfaces. The specific heat shows unambiguously the ordering of the spins in the layers. The results show clearly the transition from a single transition temperature to two distinct transitions with increasing thickness of the individual layers. From this data, the authors are able to determine the interface magnetic exchange coupling constant and the effect on the transition temperature of finite layer thickness.

23852 (DOE/PC/92542–T10) **Robotic weld overlay coatings for erosion control. Quarterly technical progress report, January 1995–March 1995.** Levin, B.F.; Dupont, J.N.; Marder, A.R. Lehigh Univ., Bethlehem, PA (United States). Energy Research Center. 25 Apr 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92542. Order Number DE95015957. Source: OSTI; NTIS; GPO Dep.

Research is presently being conducted to develop a criteria for selecting weld overlay coatings for erosion mitigation in Circulated Fluidized Beds. During the last two quarters tensile tests were performed at 400°C for the Ultimet, Inconel-625, 316L SS, C-22, and Stellite-6 wrought alloys. Also, the erosion tests for these materials at 400°C were completed. The results of mechanical and erosion tests are used to correlate mechanical properties of selected wrought alloys such as tensile toughness, ductility, strain hardening coefficient and yield strength to their erosion resistance at 400°C. Preliminary results of correlations between erosion resistance of wrought alloys at 400°C and their mechanical properties are presented in this progress report.

23853 (ENEA-RT-ERG-FUS–95-06) **Induction heating in in-line strip production process.** Costa, P. (ENEA, Frascati (Italy). Centro Ricerche Energia - Area Energia e Innovazione); Santinelli, M. Associazione EURATOM-ENEA sulla Fusione, Frascati (Italy). May 1995. 17p. (In Italian). Order Number DE95789739. Source: OSTI; NTIS (US Sales Only).

ISP (in-line strip production), a continuous process for steel strip production, has recently been set in an italian innovative plant, where ecological impact and power requirements are lighter than usual. This report describes the studies performed by ENEA (Italian Agency for New Technologies, Energy and the Environment), while a prototype reheating facility was arranged by Acciaieria ISP in Cremona (Italy). The authors, after a study of the prototype electromagnetic field, calculate the heating rate, with the thermal network method. Then they detect, with a 1-D-FEM, the heat diffusion through the strip cross section. Afterward, since the heat distribution depends on the eddy current density one, which is given by the magnetic field distribution, the authors, with a 3-D-FEM, carry out a coupled, electromagnetic and thermal, analysis in time domain. The strip temperature map is established by the balance between skin depth heating and surface cooling: a thermal analysis, performed with a moving 2-D-FEM, take into account the effects of the different heating and cooling situations, originated by the strip moving at a speed of 6m/min through four consecutive reheating facilities. The temperatures of a strip sample heated by the prototype have been monitored, acquired by a computer and related with the simulation results. The little difference between experiment and simulation assessed the qualitative and quantitative validity of this analysis, that has come out to be a tool, useful to evaluate the effects of possible improvements to the ISP process.

23854 (FZKA–5550) **Irradiation programme MANITU: Results of pre-examinations and Charpy tests with unirradiated materials.** Rieth, M.; Dafferner, B.; Ries, H.; Romer, O. Forschungszentrum Karlsruhe GmbH Technik und Umwelt (Germany). Inst. fuer Materialforschung; Forschungszentrum Karlsruhe GmbH Technik und Umwelt (Germany). Hauptabteilung Versuchstechnik; Forschungszentrum Karlsruhe GmbH Technik und Umwelt (Germany). Projekt Kernfusion; Association Euratom-Forschungszentrum Karlsruhe GmbH Technik und Umwelt (Germany). Apr 1995. 74p. (In German). Order Number DE95795766. Source: OSTI; NTIS (US Sales Only); INIS.

The irradiation project MANITU was planned in the frame of the European Long-term Fusion Materials Development Programme. The results of MANITU will have a lasting influence on the future actions within the materials development programme. The problem of the irradiation induced embrittlement of possible martensitic alloy candidates is still unsolved. But after the evaluation of sub-size Charpy tests with the unirradiated refrence specimens of MANITU a first tendency is recognizable. The Charpy properties of the newly developed low activation 7-10% Cr-WVTa alloys are clearly better compared with the modified commerical 10-11% Cr-NiMoVNb steels. In the present report the pre-examinations are documented and the Charpy test results with unirradiated reference specimens are analysed and assessed. (orig.)

23855 (FZKA–5557) **Experimental determination of the thermal conductivity of liquid stainless steel.** Bober, M.; Singer, J. Forschungszentrum Karlsruhe GmbH Technik und Umwelt (Germany). Inst. fuer Neutronenphysik und Reaktortechnik;

Forschungszentrum Karlsruhe GmbH Technik und Umwelt (Germany). Projekt Nukleare Sicherheitsforschung. Feb 1995. 14p. (In German). Order Number DE95795759. Source: OSTI; NTIS (US Sales Only); INIS.

The thermal conductivity of liquid stainless steel was obtained from measurements of the melting depth, surface temperature and heat absorption on locally molten specimens. A Nd:YAG-laser pulse of 3 ms in length and of a uniformly flat power distribution in respect of space and time yielded a quasi-stationary surface melting of the specimen. The surface temperature was measured pyrometrically and the thickness of the refrozen molten layer was found out metallographically. The evaluation of the thermal conductivity of the stainless steel X10 NiCrMoTiB 15 15 (DIN-Nr. 1.4970) resulted in a mean value of 31 ± 9 Wm^{-1} K^{-1} in the temperature range of 1700-2500 K. (orig.)

23856 (GKSS–95/E/3) **Finite element analysis for detecting stress distributions and measuring the I-integral in a surface crack in a welded joint of a plate test piece and a pipe segment.** Dietrich, R.A. (GKSS-Forschungszentrum Geesthacht GmbH (Germany). Inst. fuer Gewaesserphysik). GKSS-Forschungszentrum Geesthacht GmbH (Germnay). 1995. 64p. (In German). Order Number DE95795736. Source: OSTI; NTIS (US Sales Only).

For evaluating the stresses of a plate specimen and a pipe segment with a defect by a surface crack in a welding joint, nonlinear finite element analyses are performed. The plate specimen is succumbed to a load by means of a bending moment or a tension. At the pipe segment a four-point bending moment can be found. The finite element analyses lead to knowledge about the stress distribution, the J-integral and the triaxiality ratio of the stress condition in the area of the crack front and about the opening of the surface crack. (orig.)

23857 (JAERI-Research–95-031) **Research on fretting corrosion behavior of structural materials used in nitric acid environments for spent fuel reprocessing . 2. Effect of nitric acid temperature on fretting corrosion behavior of zirconium.** Sakairi, Masatoshi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Kiuchi, Kiyoshi. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 34p. (In Japanese). Order Number DE95789321. Source: OSTI; NTIS; INIS.

Zirconium (Zr) is considered to be one of the promising candidate material applied for commercial spent fuel reprocessing plants. Because, it shows high corrosion resistance in highly oxidizing nitric acid solutions. However, the corrosion resistance is weaken under wear condition. Both rotating (type I) and reciprocal (type II) abrasion type fretting corrosion tests were used to study the fretting corrosion resistance of Zr in 3N HNO_3 at various temperature. From both test results, Zr showed high thickness loss rate. The thickness loss rate is increased with increasing the applied momentum, which is estimated from the values of abrasion speed and load. In type II tests, the thickness loss rate was increased with increasing temperature. It shows maximum value at boiling point. A possible reason for the low fretting corrosion resistance of Zr may be interpreted with based on the mechanical break along the crystal habit plane and the slow repassivation rate in boiling 3N HNO_3. (author).

23858 (JAERI-Research–95-032) **Corrosion fatigue behavior of zirconium in boiling nitric acid.** Motooka, Takafumi (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Kiuchi, Kiyoshi. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 26p. (In Japanese). Order Number DE95789322. Source: OSTI; NTIS; INIS.

The corrosion fatigue behavior of zirconium in boiling nitric acid has been studied to evaluate the reliability of zirconium used in nuclear fuel reprocessing equipment. An apparatus designed for corrosion fatigue tests in boiling nitric acid was used. The crack growth rate of zirconium was measured as a function of the stress intensity factor using TDCB type specimens. After the tests, the fracture morphology was examined with a scanning electron microscope. The crack growth rate was influenced with the texture of specimens and the test environments. In air at room temperature, the crack growth rate at the longitudinal direction of specimens was faster than that of the transverse direction. Moreover, the crack growth rate in boiling nitric acid was more faster than that in air at room temperature. According to the fractographic examination, X-ray analysis, and so on, the observed results were interpreted with based on the crystal anisotropy on mechanical properties and the susceptibility to stress corrosion cracking in boiling nitric acid of zirconium. (author).

23859 (JAERI-Tech–95-017) **Joining technology development of advanced materials/SS304 by friction welding.** Tsuchiya, Kunihiko (Japan Atomic Energy Research Inst., Oarai, Ibaraki (Japan). Oarai Research Establishment); Kawamura, Hiroshi; Oyamada, Rokuro. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 79p. Order Number DE95789298. Source: OSTI; NTIS; INIS.

A friction welding is one of the most popular welding method for joint of different materials. In the JMTR(Japan Materials Testing Reactor), intensive studies have been made on various materials and stainless steel joints fabricated by friction welding method and used for structural materials as pressure boundaries of irradiation capsule against the primary coolant of the JMTR. Niobium alloy is one of advanced materials because of the heat resisting and low activation material. The friction welding can be applied to joints of niobium alloy/SS304. In the present work, the welding technique and characteristics of friction welded Nb1%Zr/SS304 were investigated under un-irradiated and irradiated specimens. The study items for Nb1%Zr/SS304 joints by friction welding are as follows: the measurement of tensile strength, torsion fatigue strength, burst strength and hardness, metallography and XMA analysis for neutron-un-irradiated specimens. The measurement of tensile strength and hardness, metallography and XMA analysis for neutron-irradiated specimens. The results obtained were as follows: A suitable fabricating condition were obtained from experiments for friction welding of Nb1%Zr/SS304. From un-irradiated data, tensile strength of Nb1%Zr/SS304 joints was equal to the strength of Nb1%Zr alloy. Fatigue strength of Nb1%Zr/SS304 joints was similar to the strength of Nb1%Zr alloy and burst positions by burst test were the parts of Nb1%Zr alloy. From post-irradiation examination, all specimens have been broken at the part of Nb1%Zr alloy, and the strength of irradiated specimens increased comparing with that of un-irradiated specimens. The hardness of irradiated specimens also increased comparing with that of un-irradiated specimens. (author).

23860 (LA-UR–95-1940) **Landau-Ginzburg model of interphase boundaries in CsCl-type ferroelastics due to M^-_5 mode instability: $LaAg_{1-x}In_x$.** Hatch, D.M. (Brigham Young Univ., Provo, UT (United States). Dept. of Physics); Saxena, A.; Barsch, G.R. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95015277. Source: OSTI; NTIS; GPO Dep.

We have constructed a Landau-Ginzburg model of ferroelastic domain walls in the tetragonal phase of CsCl-type intermetallic compounds. This improper ferroelastic phase transition is driven by the condensation of a degenerate zone-edge phononmode of M^-_5 symmetry and can be described by a six-component order parameter. Analytic and numerical kink-type soliton solutions for the order parameter profile and the strain distribution are obtained for three different interphase boundaries: a twin boundary and two antiphase boundaries. The stability, merging and splitting of various domain types are also studied. Specifically, a symmetry-allowed product phase of I4/mmm (D^{17}_{4h}) symmetry has been experimentally observed in pseudobinary rare earth alloys of composition RAg_{1-I} In_I (R=La, Ce, Pr) and in related systems (YCu, LaCd).

23861 (LBF-TB–200(1994)) **Papers of the sixth LBF colloquium on March 1st and 2nd, 1994 in Darmstadt.** Buxbaum, O. (ed.); Rupp, A. (ed.). Fraunhofer-Institut fuer Betriebsfestigkeit (LBF), Darmstadt (Germany). 1994. . 327p. (In German). (CONF-9403173–: 6. colloquium of Fraunhofer-Institut fuer Betriebsfestigkeit (LBF), Darmstadt (Germany), 1-2 Mar 1994). Order Number DE95796279. Source: OSTI; NTIS (US Sales Only).

These proceedings contain 14 papers presented at the 6th LBF meeting at Darmstadt on 1 and 2 March 1994. Four subjects were covered: (1) New materials and surface coatings; (2) Load

assumptions and simulation; (3) Component inherent material behavior; and (4) Numerical methods and application. In an annex photos of eight poster presentations are shown. (CT)

23862 (LBF-TB–200(1994), pp. 169-197) **Strength behavior of welded joints under combined in-phase and phase-shifted multiaxial stresses.** Sonsino, C.M. Fraunhofer-Institut fuer Betriebsfestigkeit (LBF), Darmstadt (Germany). 1994. 327p. (In German). (CONF-9403173–: 6. colloquium of Fraunhofer-Institut fuer Betriebsfestigkeit (LBF), Darmstadt (Germany), 1-2 Mar 1994). In *Papers of the sixth LBF colloquium on March 1st and 2nd, 1994 in Darmstadt.* Order Number DE95796279. Source: OSTI; NTIS (US Sales Only).

Under this study center welded cross specimens made of the fine grained structural steel StE 290 and flange-to-tube joints made of the fine grained structural steel StE 460 with mechanically non-machined and machined welds were investigated in the range between 10^3 and 5.10^6 load cycles and a strength hypothesis was developed on the basis of local notch basic loads which describes the fatigue strength behavior of weldments under single-stage multiaxial loads with constant and variable main load directions or in-phase and phase-shifted loads. (orig./MM)

23863 (LBF-TB–200(1994), pp. 211-238) **Fatigue life prediction for integrally cast turbine wheels while taking into account short cracks using the nickel base alloy IN 713 C as an example.** Brandt, U.; Sonsino, C.M. Fraunhofer-Institut fuer Betriebsfestigkeit (LBF), Darmstadt (Germany). 1994. 327p. (In German). (CONF-9403173–: 6. colloquium of Fraunhofer-Institut fuer Betriebsfestigkeit (LBF), Darmstadt (Germany), 1-2 Mar 1994). In *Papers of the sixth LBF colloquium on March 1st and 2nd, 1994 in Darmstadt.* Order Number DE95796279. Source: OSTI; NTIS (US Sales Only).

The cast alloy IN 713 C (cast condition) frequently used in turbine wheels was used to determine fatigue strength results under quasi-operational conditions within the range of low cycle fatigue with the objective of transferring the initial crack and crack propagation behavior to notched specimens and later to turbine wheels, while taking into account an inhomogeneous stress and strain distribution, respectively. This transferability relates only to results below 600 C, because this temperature occurs in the critical region of the turbine wheel, the hub. (orig.)

23864 (LNF-P–95-013) **Influence of interstitial solutions (H, N) on cerium electronic state in Ce-Fe intermetallic compounds: X-ray Absorption Spectroscopy (XAS) study.** Chaboy, J. (Zaragoza Univ. (Spain). Inst. de Ciencia de los Materiales de Aragon); Marcelli, A.; Bozukov, L. Istituto Nazionale di Fisica Nucleare, Frascati (Italy). Mar 1995. 26p. Order Number DE95789752. Source: OSTI; NTIS (US Sales Only).

It is presented an x-ray absorption spectroscopy (XAS) investigation performed at the L-edges of the rare-earth and at the K-edge of iron in the R-Fe intermetallic compounds (La, $Ce)_2Fe_{14}BH_\chi$ and $Ce_2Fe_{17}(H, N)_\chi$, to elucidate the role of the interstitial doping into the electronic and magnetic properties of these systems. Comparison with x-ray circular magnetic dichroism (XCMD) experiments has been carried out to clarify the localization of 4f magnetic moment at the Ce sites upon hydriding. Both XAS and XCMD results evidence the interplay between the structural and magnetic changes, that are associated to the modification of the hybridization between the Fe(3d) and Ce(5d) bands.

23865 (ORNL/SUB–87-SB154/03) **Pack cementation diffusion coatings for iron-base alloys.** Rapp, R.A. (Ohio State Univ., Columbus, OH (United States). Dept. of Materials Science and Engineering). Oak Ridge National Lab., TN (United States); Ohio State Univ., Columbus, OH (United States). Dept. of Materials Science and Engineering. Feb 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95013450. Source: OSTI; NTIS; GPO Dep.

With the aid of computer-assisted calculations of the equilibrium vapor pressures in halide-activated cementation packs, processing conditions have been identified and experimentally verified for the codeposition of two or more alloying elements in a diffusion coating on a variety of steels. The Cr-Si ferrite layers have proven to be very resistant to high temperature cyclic oxidation and to pitting in aqueous solutions. The process has been patented, and is being transferred for industrial application, e.g. for water walls of utility boilers, etc. In the proposed extension of this project, the use of mixed pure metal powders in the pack will be extended to achieve similar ferrite Fe-Cr-Al coatings with excellent oxidation resistance, with the eventual transfer of the technology to industry. In other recent studies, Ni-base alloy rods were aluminized by the halide-activated pack cementation process to bring their average composition to that for the ORNL-developed Ni_3Al, for use as a welding rod. A similar effort to develop a welding rod for the ORNL Fe_3Al alloy did not yield reproducible coating compositions or growth kinetics. The continued effort to produce Duriron-type (Fe-18Si-5Cr) coatings on steels was not successful. Literature for the intrinsic diffusion coefficients suggests that this task cannot be achieved.

23866 (SAND–95-0841C) **Monitoring of MOCVD reactants by UV absorption.** Baucom, K.C.; Killeen, K.P.; Moffat, H.K. Sandia National Labs., Albuquerque, NM (United States). [1995]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950429–1: 7. biennial workshop on organometallic vapor phase epitaxy, Fort Meyers, FL (United States), 2-6 Apr 1995). Order Number DE95014605. Source: OSTI; NTIS; GPO Dep.

In this paper, we describe how UV absorption measurements can be used to measure the flow rates of metal organic chemical vapor deposition (MOCVD) reactants. This method utilizes the calculation of UV extinction coefficients by measuring the total pressure and absorbance in the neat reactant system. The development of this quantitative reactant flow rate monitor allows for the direct measurement of the efficiency of a reactant bubbler. We demonstrate bubbler efficiency results for TMGa, and then explain some discrepancies found in the TMAl system due to the monomer to dimer equilibrium. Also, the UV absorption spectra of metal organic and hydride MOCVD reactants over the wavelength range 185 to 400 nm are reported.

23867 (SAND–95-1287C) **Applications of microstructural modeling.** Holm, E.A. Sandia National Labs., Albuquerque, NM (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9506212–1: Workshop on rational design and processing of advanced ceramics, La Jolla, CA (United States), 21-23 Jun 1995). Order Number DE95014602. Source: OSTI; NTIS; GPO Dep.

This paper describes the use of computerized simulation to model microstructures of various materials.

23868 (SAND–95-8502C) **Modeling the segregation of hydrogen to lattice defects in nickel.** Angelo, J.E.; Moody, N.R.; Baskes, M.I. Sandia National Labs., Livermore, CA (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-940945–8: 5. international conference on hydrogen effects on material behavior, Moran, WY (United States), 11-15 Sep 1994). Order Number DE95010759. Source: OSTI; NTIS; GPO Dep.

In order to better understand the effect of hydrogen on the fracture behavior of nickel, this study uses the embedded atom method (EAM) to model the segregation of hydrogen to lattice defects in nickel. The dislocations modeled include an edge, a screw, and a Lomer dislocation in the locked configuration, i.e. the Lomer-Cottrell Cock (LCL). Several coincident site lattice boundaries are also investigated, these being the $\Sigma3(112)$ and $\Sigma11(113)$ tilt boundaries. It will be shown that the trap site energies in the vicinity of both the edge and screw dislocations is only about 0.1 eV while for the LCL and all of the grain boundaries the maximum trap site energy in the vicinity of the defect is on order 0.3 eV. Using a Monte-Carlo method to a impose a hydrogen environment produces much stronger segregation of hydrogen to the deeper traps. When compared to recent experimental studies showing that a binding energy between 0.3-0.4 eV is required for trap site controlled fracture in IN903, it can be concluded that the embrittlement process is most probably associated with trapping of hydrogen to the Lomer-Cottrell Locks.

23869 (SAND–95-8513C) **A model of phase transformation plasticity.** Bammann, D.J.; Prantil, V.C.; Lathrop, J.F. Sandia

National Labs., Livermore, CA (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9509118–3: Modeling of casting, welding and advanced solidification processes 7, London (United Kingdom), 10-15 Sep 1995). Order Number DE95010699. Source: OSTI; NTIS; GPO Dep.

To numerically describe the welding of high strength steels, an accurate constitutive model must be used for both the filler as well as base material. For such multiphase materials, a consistent model must be developed to account for the response of each phase and the volumetric differences between the phases during transformation. We have proceeded with this task by initially considering two phases, austenite and martensite. The response of each phase is modeled using the previously developed state variable model of Bammann. We assume that each continuum point is occupied by both phases and introduce the volume fraction as an independent variable. The phases interact through a stress field which acts as a forward stress in the softer austenite, thereby introducing additional plastic flow which has been previously referred to as transformation induced plasticity (TRIP). Simultaneously there is a backward stress in the harder phase retarding the plastic flow of that phase. To satisfy equilibrium between the phases, the average stress at the point is assumed to satisfy a volume fraction weighted rule of mixtures while the average strain is imposed on each phase. Evolution equations are assumed for the transformation kinetics and interaction stress to complete the system. This approach eliminates the need for introduction of a transformation plasticity strain rate term and lends itself to efficient numerical implementation into finite element codes. Simulation of a simple quenching boundary value problem will be discussed.

23870 (SAND–95-8525C) **Temperature-dependent structure of a(10$\bar{1}$) superdislocations in Ni_3Al.** Chrzan, D.C. (Sandia National Labs., Livermore, CA (United States)); Foiles, S.M.; Daw, M.S.; Mills, M.J. Sandia National Labs., Livermore, CA (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941144–153: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95010755. Source: OSTI; NTIS; GPO Dep.

The dissociated structure of the a(101) superdislocations in Ni_3Al is predicted as a function of temperature. The temperature dependence of the relevant fault Helmholtz free energies and elastic constants are calculated within the quasiharmonic approximation using the embedded atom method, Results of these calculations are then incorporated into anisotropic elasticity theory-based calculations of the dissociation distances. The cross-slip activation enthalpy is estimated and found to decrease by 24% at 600 K when compared with its 0 K value. The calculations point to the need to perform experiments to address this temperature dependence.

23871 (SAND–95-8534C) **Analysis of buckling distortion in bead-on-plate Ti 6-4 welds.** Ortega, A.R. (Sandia National Labs., Livermore, CA (United States)); Lathrop, J.F.; Corderman, R.E.; Fuchs, E.A.; Hess, B.V.; Mahin, K.W.; Giamei, A.F. Sandia National Labs., Livermore, CA (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9509118–4: Modeling of casting, welding and advanced solidification processes 7, London (United Kingdom), 10-15 Sep 1995). Order Number DE95010763. Source: OSTI; NTIS; GPO Dep.

Three-dimensional thermal-mechanical analyses of autogenous GTA bead-on-plate welds of Ti 6Al-4V have been performed. Sequential coupling of the thermal and mechanical analyses was employed. Predicted time-dependent temperature distributions from the thermal analysis code, JACQ3D, were provided as input to ATAQUS for the mechanical analysis. The heat input to the workpiece is modeled as a traveling Gaussian heat flux distribution. Thermal losses from the workpiece due to convection, radiation, and metal evaporation are included in the analysis. The material model is a bilinear temperature-dependent elastic-plastic model. The buckling distortion observed in the post-weld workpiece was successfully modeled using shell finite elements. A complete set of experimental data was obtained in this study to validate the numerical model. Computed thermal results compared favorably with measured temperatures (thermocouples and infrared thermography) and fusion zone shape. Real-time displacement data obtained from video cameras agreed well with predicted mechanical results. In particular, the initiation of buckling, which was observed in the displacement data, was captured in the simulation.

23872 (UCRL-ID–118664) **The effect of actinide thin films on the electronic structure and reactivity of various elements.** Gouder, T.; Colmenares, C. Lawrence Livermore National Lab., CA (United States). 8 Dec 1994. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015845. Source: OSTI; NTIS; GPO Dep.

This report summarizes the experimental work carried out at the Lawrence Livermore National Laboratory on the electronic structure and reactivity of uranium thin films on Pd, Pt, Si, graphite, Cu, and Au substrates from 1990 to 1993. The U-Pd system was studied in the most detail because it was the first to be chosen right after the completion of the experimental equipment. We first studied and characterized clean U overlayers and the possible surface reactions between this metal and the substrates studied. We then subjected these systems to reactive conditions such as heating and adsorbing corrosive gases (O_2, CO, CO_2, and C_2H_4). Finally we investigated the diffusion of U metal and some of its compounds into the substrates. A new technique was developed, based on Auger Electron Spectroscopy, to follow in real time the diffusion of U overlayers into the substrate. The temperature of the sample is ramped linearly up to 900°C while following the Auger peak intensities of the two components for a given system. Diffusion rates are obtained by differentiating the measured intensity curves, then peaks result corresponding to diffusion processes with different activation energies. This technique bears a strong similarity to thermal desorption spectroscopy (TDS), where the sample is heated linearly and the rate of desorption is measured as a function of temperature and heating rate.

23873 (UCRL-ID–119089) **Broad-band characterization of the complex permittivity and permeability of materials.** Avalle, C.A. (Lawrence Livermore National Lab., CA (United States). Electromagnetics and Diagnostics Group). Lawrence Livermore National Lab., CA (United States). Nov 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95014372. Source: OSTI; NTIS; GPO Dep.

By employment of state-of-the-art Vector Network Analyzers, and other wide-band measurement equipment and techniques, the authors have the capability of measuring the complex permittivity and permeability of materials, for frequencies ranging from several tens of Kilohertz up to several Gigahertz. Measurement methods and equations for numerical determination are based on recommendations by the National Institute of Standards and Technology (NIST). Types of materials which can be analyzed are dielectric or magnetic RF and radar absorbers; thin sheets, paints, coatings; castable resins; foams and low density materials; ceramics and ferrites; carbonized fabrics; and composites.

23874 (UCRL-ID–120373) **Investigation of the reaction rates between uranium and liquid aluminum.** Strum, M.J. (Lawrence Livermore National Lab., CA (United States)); Sedillo, E.; Smugeresky, J. Lawrence Livermore National Lab., CA (United States). 5 May 1995. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015951. Source: OSTI; NTIS; GPO Dep.

A limited study consisting of scoping experiments was carried out to determine if a uranium-niobium alloy was weakly or strongly resistant to penetration by liquid aluminum alloy 6061. Our investigation was limited to temperatures between 700°and 900°C and carried out using small cylindrical coupons of U-6wt.%Nb and unalloyed U in unsaturated molten aluminum and aluminum alloy 6061 baths. The results indicate that indeed, significant dissolution of uranium into molten aluminum occurs and in relatively short times. The diameters of U-6wt.%Nb test cylinders immersed in unsaturated Al-6061 decreased linearly with time at 700°C, 800°C, and 900°C at rates of 1.14 mm/h, 3.0 mm/h, and 3.5 mm/h, respectively. However, we have found that the reaction rates were significantly reduced by the alloying elements niobium and magnesium. These results suggest that a more detailed investigation could lead to a predictive capability for control of these reaction

rates. In unalloyed U, the rate of U dissolution increased by up to a factor of ten relative to that in U- 6wt.%Nb. In both materials, the dissolution of the U core was found to occur by advance of a continuous intermetallic layer, which redissolves into the unsaturated liquid Al bath. The Nb additions resulted in the formation of a thick transition layer composed of intermetallic and U-saturated liquid. In unalloyed U, however, the transition layer was largely reduced in thickness, allowing unsaturated liquid adjacent to the continuous intermetallic layer. Another important variable identified was the influence of surface condition on interface reactivity. At 900°C, liquid attack was completely absent over large regions of U-6wt.% Nb samples immersed in Al-6061. Surface analysis by EDX identified the presence of up to 24 at.% Mg in unattacked areas.

23875 (UCRL-JC–117772) **A parallel 3D ALE code for metal forming analyses.** Neely, R.; Couch, R.; Dube, E.; Futral, S. Lawrence Livermore National Lab., CA (United States). 30 Jan 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9506144–5: 5. international conference on numerical methods in industrial forming processes (NUMIFORM), Ithaca, NY (United States), 18-21 Jun 1995). Order Number DE95011739. Source: OSTI; NTIS; GPO Dep.

A three-dimensional arbitrary Lagrange-Eulerian (ALE) code is being developed for use as a general purpose tool for metal forming analyses. The focus of the effort is on the processes of forging, extrusion, casting and rolling. The ALE approach was chosen as an efficient way to deal with the large deformations and complicated flows associated with these processes. A prototype version of the software package, ALE3D, exists and is being applied to the enumerated processes. The development of the code is being driven by the dual constraints of portability and extensibility. A general purpose simulation tool must be capable of mining on a variety of platforms from single processor workstations to massively parallel platforms. It might also be configured to easily accommodate new physical models and parameters. The focus of this paper will be on computer science issues, with parallelization being the dominant issue. Long term goals will be described, as well as current status.

23876 (UCRL-JC–119347) **Development of a sensor and control system for the production of titanium matrix composites.** Berzins, L.V. (and others); McClelland, M.A.; Anklam, T.M. Lawrence Livermore National Lab., CA (United States). Mar 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. ARPA Contract MDA972-90-C-0018. (CONF-950833–2: 10. international conference on composite materials, Whistler (Canada), 14-18 Aug 1995). Order Number DE95014162. Source: OSTI; NTIS; GPO Dep.

Titanium matrix composites promise to dramatically increase the thrust-to-weight ratio of gas turbine engines. Electron Beam Physical Vapor Deposition (EB-PVD) is ideal for coating fibers if issues with composition control can be worked out. LLNL is developing a control system based on Diode Laser Absorption Spectroscopy (DLAS) for the deposition of titanium orthorhombic alloys. In this paper, the important features and components of a DLAS control system are reviewed and a methodology for selecting the appropriate atomic transitions is described. Data characterizing the diagnostic performance as well as information on potential control strategies is presented. Finally, applications of this diagnostic to other alloy systems are discussed.

23877 (UCRL-JC–119687) **Development of a bipolar cell for electrochemical production of lithium.** Cooper, J.F. (Lawrence Livermore National Lab., CA (United States)); Mack, G.; Peterman, K.; Weinland, S.; McKenzie, P. Lawrence Livermore National Lab., CA (United States). 22 Feb 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950518–7: 187. meeting of the Electrochemical Society, Reno, NV (United States), 21-26 May 1995). Order Number DE95013456. Source: OSTI; NTIS; GPO Dep.

Lithium metal can be electrolytically refined from aqueous solutions of its compounds by partial reduction to form a lithium amalgam, followed by reduction of the amalgam to liquid lithium in a molten salt cell at 225 C. A bipolar cell (with a continuous, amalgam electrode circulating between the aqueous and salt cells) was designed, constructed and successfully tested on the bench scale, as a proof of principle of an efficient, safe and low-temperature alternative to existing processes.

23878 (WAPD-T–3054) **Irradiation-assisted stress corrosion cracking of HTH Alloy X-750 and Alloy 625.** Bajaj, R.; Mills, W.J.; Lebo, M.R.; Hyatt, B.Z.; Burke, M.G. Westinghouse Electric Corp., West Mifflin, PA (United States). Bettis Atomic Power Lab. [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC11-93PN38195. (CONF-950816–1: 7. NACE international symposium on environmental degradation of materials in nuclear power plants: water reactors, Breckenridge, CO (United States), 6-10 Aug 1995). Order Number DE95014553. Source: OSTI; NTIS; INIS; GPO Dep.

In-reactor testing of bolt-loaded compact tension specimens was performed in 360 C water. New data confirms previous results that high irradiation levels reduce SCC resistance in Alloy X-750. Low boron heats show improved IASCC (irradiation-assisted stress corrosion cracking). Alloy 625 is resistant to IASCC. Microstructural, microchemical, and deformation studies were carried out. Irradiation of X-750 caused significant strengthening and ductility loss associated with formation of cavities and dislocation loops. High irradiation did not cause segregation in X-750. Irradiation of 625 resulted in formation of small dislocation loops and a fine body-centered-orthorhombic phase. The strengthening due to loops and precipitates was apparently offset in 625 by partial dissolution of γ precipitates. Transmutation of boron to helium at grain boundaries, coupled with matrix strengthening, is believed to be responsible for IASCC in X-750, and the absence of these two effects results in superior IASCC resistance in 625.

23879 (WAPD-T–3055) **Stress corrosion cracking behavior of Alloy 600 in high temperature water.** Webb, G.L.; Burke, M.G. Westinghouse Electric Corp., West Mifflin, PA (United States). Bettis Atomic Power Lab. [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC11-93PN38195. (CONF-950816–2: 7. NACE international symposium on environmental degradation of materials in nuclear power plants: water reactors, Breckenridge, CO (United States), 6-10 Aug 1995). Order Number DE95014554. Source: OSTI; NTIS; INIS; GPO Dep.

SCC susceptibility of Alloy 600 in deaerated water at 360 C (statically loaded U-bend specimens) is dependent on microstructure and whether the material was cold-worked and annealed (CWA) or hot-worked and annealed (HWA). All cracking was intergranular, and materials lacking grain boundary carbides were most susceptible to SCC initiation. CWA tubing materials are more susceptible to SCC initiation than HWA ring-rolled forging materials with similar microstructures (optical metallography). In CWA tubing materials, one crack dominated and grew to a visible size. HWA materials with a low hot-working finishing temperature (<925 C) and final anneals at 1010-1065 C developed both large cracks (similar to those in CWA materials) and small intergranular microcracks detectable only by destructive metallography. HWA materials with a high hot-working finishing temperature (>980 C) and a high-temperature final anneal (>1040 C), with grain boundaries that are fully decorated, developed only microcracks in all specimens. These materials did not develop large, visually detectable cracks, even after more than 300 weeks exposure. A low-temperature thermal treatment (610 C for 7h), which reduces or eliminates SCC in Alloy 600, did not eliminate microcrack formation in high temperature processed HWA materials. Conventional metallographic and analytical electron microscopy (AEM) were done on selected materials to identify the factors responsible for the observed differences in cracking behavior. Major difference between high-temperature HWA and low-temperature HWA and CWA materials was that the high temperature processing and final annealing produced predominantly "semi-continuous" dendritic M_7C_3 carbides along grain boundaries with a minimal amount of intragranular carbides. Lower temperature processing produced intragranular M7C3 carbides, with less intergranular carbides.

23880 (ANL/ET/CP–85328) **Automated laser scatter detection of surface and subsurface defects in Si_3N_4 components.** Steckenrider, J.S. (Argonne National Lab., IL (United States). Energy Technology Div.). Argonne National Lab., IL (United States); Solar Turbines, Inc., San Diego, CA (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-92CE40960. (CONF-950129–10: 19. annual conference on advanced ceramics, materials and structures, Cocoa Beach, FL (United States), 9-12 Jan 1995). Order Number DE95013498. Source: OSTI; NTIS; GPO Dep.

Silicon Nitride (Si_3N_4) ceramics are currently a primary material of choice to replace conventional materials in many structural applications because of their oxidation resistance and desirable mechanical and thermal properties at elevated temperatures. However, surface or near-subsurface defects, such as cracks, voids, or inclusions, significantly affect component lifetimes. These defects are currently difficult to detect, so a technique is desired for the rapid automated detection and quantification of both surface and subsurface defects. To address this issue, the authors have developed an automated system based on the detection of scattered laser light which provides a 2-D map of surface or subsurface defects. This system has been used for the analysis of flexure bars and button-head tensile rods of several Si_3N_4 materials. Mechanical properties of these bars have also been determined and compared with the laser scatter results.

23881 (ANL/ET/CP–86059) **Development of nondestructive evaluation methods and prediction of effects of flaws on the fracture behavior of structural ceramics.** Ellingson, W.A. (and others); Singh, J.P.; Sivers, E.A. Argonne National Lab., IL (United States). Apr 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9505204–4: 9, annual conference on fossil energy materials, Oak Ridge, TN (United States), 16-18 May 1995). Order Number DE95013783. Source: OSTI; NTIS; GPO Dep.

Continuous fiber ceramic matrix composites are being developed for turbine engine components, heat exchangers, and hot-gas filters in fossil energy systems. Reliable application requires nondestructive evaluation (NDE) methods that provide data for quality assurance and inputs to life time prediction models and that aid in process development. NDE developments at Argonne have focused on methods to assess density distribution, fiber orientation (for mechanical properties), and defect detection in both SiC/SiC and $A1_2O_3/A1_2O_3$ materials. and that also assess the chemical state at fiber/matrix interfaces. 2-D cloth lay-up and 3-D weave CVI-infiltrated SiC/SiC specimens were studied by X-ray imaging methods now under development. Microfocus X-ray computerized tomography (MXCT) methods are being developed to provide these data. Multinuclear Nuclear Magnetic Resonance spectroscopy (13C, 29Si, and 11B) is under development for quantizing B content at fiber/matrix interfaces. Magic angle spinning techniques on SiC/SiC specimens with different coating thicknesses showed that quantification of B at the Interface is achievable. NDE data are being coupled to room- and elevated-temperature fracture studies to evaluate effects of fiber orientation and fiber coating thickness on resulting flaw morphology and mechanical properties of Nicalon-fiber-reinforced SiC matrix composites. Specifically, composites with fiber cloth lay-up sequences of varying coating thicknesses were evaluated. For room-temperature mechanical evaluation, composites with carbon-fiber coating thicknesses of 0 and 0.2 μm were used, while elevated-temperature studies used composites with a coating thickness of 0.4 μm. Composites with uncoated fibers failed in a brittle mode, while composites with 0.2 μm fiber coating showed noncatastrophic failure.

23882 (ANL/ITD/PC–86699) **Tribology and coatings.** Argonne National Lab., IL (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95013396. Source: OSTI; NTIS; GPO Dep.

The future use of fuel-efficient, low-emission, advanced transportation systems (for example, those using low-heat-rejection diesel engines or advanced gas turbines) presents new challenges to tribologists and materials scientists. High service temperatures, corrosive environments, and extreme contact pressures are among the concerns that make necessary new tribological designs, novel materials, and effective lubrication concepts. Argonne is working on methods to reduce friction, wear and corrosion, such as soft metal coatings on ceramics, layered compounds, diamond coatings, and hard surfaces.

23883 (CONF-941144–155) **Synthesis and characterization of a metastable $(SiC)_3N_4$ phase.** Uslu, C. (Georgia Inst. of Tech., Atlanta, GA (United States). School of Materials Science and Engineering); Park, B.; Poker, D.B. Oak Ridge National Lab., TN (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States);Georgia Inst. of Tech., Atlanta, GA (United States). DOE Contract AC05-84OR21400. From 1994 fall meeting of the Materials Research Society (MRS); Boston, MA (United States); 28 Nov - 2 dec 1994. Order Number DE95008972. Source: OSTI; NTIS; GPO Dep.

A metastable C-SI-N compound has been synthesized by high dose N^+ implantation into polycrystalline β-SiC (cubic phase). The thin films formed upon 100 keV implantation were characterized with respect to various ion doses and target temperatures. X-ray diffraction with a position-sensitive detector and cross-sectional transmission electron microscopy revealed that the as-implanted surfaces contained $\sim$ 0.15 μm thick continuously-buried amorphous layers. Rutherford backscattering spectroscopy showed that the peak concentration of nitrogen saturated up to approximately 54 at. % with increasing doses, suggesting a new phase formation.

23884 (CONF-941144–164) **Growth and properties of $PbTiO_3$/PLT heterostructures.** Kim, Yeongkwan (Georgia Institute of Technology, Atlanta, GA (United States). School of Physics); Han, Y.H.; Erbil, A. Oak Ridge National Lab., TN (United States). Apr 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1994 fall meeting of the Materials Research Society (MRS); Boston, MA (United States); 28 Nov - 2 dec 1994. Order Number DE95013988. Source: OSTI; NTIS; GPO Dep.

Ferroelectric superlattice structures composed of three-dimensionally epitaxial $PbTiO_3$ and PLT thin films have been successfully grown on $SrTiO_3$ substrates by metalorganic chemical vapor deposition. The modulation structures were confirmed by θ-2θ XRD, and the excellent in-plane orientational relationship between the superlattice film and the substrate by (100), (110), and (111)-pole figures. The ϕ-scans through the (110) and (111) reflections were used as additional evidence for three-dimensional epitaxy. The substrate dependence of the epitaxial orientation of PLT and $PbTiO_3$ single-layered thin films was investigated. $PbTiO_3$ thin films with very high crystalline perfection can be successfully grown on $KTaO_3$ substrates.

23885 (CONF-9411236–1) **Long-term testing.** Ferber, M.; Graves, G.A. Jr. Oak Ridge National Lab., TN (United States). [1994]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Advanced turbine systems (ATS) annual review meeting; Washington, DC (United States); 8-11 Nov 1994. Order Number DE95013979. Source: OSTI; NTIS; GPO Dep.

Land-based gas turbines are significantly different from automotive gas turbines in that they are designed to operate for 50,000 h or greater (compared to 5,000–10,000 h). The primary goal of this research is to determine the long-term survivability of ceramic materials for industrial gas turbine applications. Research activities in this program focus on the evaluation of the static tensile creep and stress rupture (SR) behavior of three commercially available structural ceramics which have been identified by the gas turbine manufacturers as leading candidates for use in industrial gas turbines. For each material investigated, a minimum of three temperatures and four stresses will be used to establish the stress and temperature sensitivities of the creep and SR behavior. Because existing data for many candidate structural ceramics are limited to testing times less than 2,000 h, this program will focus on extending these data to times on the order of 10,000 h, which represents the lower limit of operating time anticipated for ceramic blades and vanes in gas turbine engines. A secondary goal of the program will be to investigate the possibility of enhancing life prediction estimates by combining interrupted tensile SR tests and tensile dynamic fatigue tests in which tensile strength is measured as a

function of stressing rate. The third goal of this program will be to investigate the effects of water vapor upon the SR behavior of the three structural ceramics chosen for the static tensile studies by measuring the flexural strength as a function of stressing rate at three temperatures.

23886 (CONF-950401–19) **Sintering of ceramics using low frequency rf power.** Caughman, J.B.O.; Hoffman, D.J.; Baity, F.W.; Akerman, M.A.; Forrester, S.C.; Kass, M.D. Oak Ridge National Lab., TN (United States). [1995]. 8p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. From 97. annual meeting of the American Ceramic Society; Cincinnati, OH (United States); 30 Apr - 1 may 1995. Order Number DE95014274. Source: OSTI; NTIS; INIS; GPO Dep.

Sintering with low frequency rf power (~50 MHz) is a new technique with unique capabilities that has been used to sinter a variety of ceramic materials, including zirconia-toughened alumina, alumina, silicon carbide, and boron carbide. Processing with low frequencies offers many advantages compared to processing with conventional microwave frequencies (915 MHz and 2.45 GHz). Because of the longer wavelength, the rf electric field penetrates materials more than microwaves. This effect allows the processing of a wider variety of materials and allows for an increase in the physical size of the material being processed. In addition, the material is heated in a single mode cavity with a uniform electric field, which reduces the occurrence of hot-spot generation and thermal runaway effects. This technique has been used to sinter large crack-free alumina samples (3 inch square) to > 97% density. The sintering and/or annealing of a number of carbide materials has been demonstrated as well, including silicon carbide, boron carbide, tungsten carbide, and titanium carbide.

23887 (CONF-9504181–1) **GELCASTING: From laboratory development toward industrial production.** Omatete, O.O.; Janney, M.A.; Nunn, S.D. Oak Ridge National Lab., TN (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States);National Inst. of Standards and Technology, Gaithersburg, MD (United States). DOE Contract AC05-84OR21400. From International conference on shaping of advanced ceramics; Mol (Belgium); 25-27 Apr 1995. Order Number DE95014267. Source: OSTI; NTIS; GPO Dep.

Gelcasting, a ceramic forming process, was developed to overcome some of the limitations of other complex-shape forming techniques such as injection molding and slip casting. In gelcasting, a concentrated slurry of ceramic powder in a solution of organic monomers is poured into a mold and then polymerized in-situ to form a green body in the shape of the mold cavity. Thus, it is a combination of polymer chemistry with slip processing and represents minimal departure from standard ceramic processing. The simplicity of the process has attracted industrial partners and by collaboration between them and the developers, the process is being advanced from the laboratory toward industrial production.

23888 (CONF-9505237–1) **Branches on the family tree: Superconductivity in epitaxial films of "first-in-line" descendants of the parent compound $SrCuO_2$.** Feenstra, R. (and others); Budai, J.D.; Norton, D.P. Oak Ridge National Lab., TN (United States). Apr 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From High Temperture Superconductor (HTS) workshop on applications and new materials; Enschede (Netherlands); 8-10 May 1995. Order Number DE95014272. Source: OSTI; NTIS; GPO Dep.

The defect-induced carrier doping in epitaxial films of the parent compound $SrCuO_2$ is reviewed. Two superconducting descendants were synthesized by expanding the role of natural defects in the parent $SuCuO_2$ films, namely, the Ruddlesheim-Popper phases $Sr_{n+1}Cu_nO_{2n+1}$ and a nonstoichiometric variant of the oxycarbonate $Sr_2CuO_2(CO_3)$. The synthesis and structures are described.

23889 (DOE/MC/30244–95/C0481) **A method for measuring non-linear elastic properties of thermal barrier coatings.** Johnson, C.A.; Ruud, J.A.; Kaya, A.C.; deLorenzi, H.G. General Electric Co., Schenectady, NY (United States). Corporate Research and Development Center. [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30244. (CONF-9509182–1: 1995 National thermal spray conference, Houston, TX (United States), 11-15 Sep 1995). Order Number DE95012913. Source: OSTI; NTIS; GPO Dep.

Accurate characterization of the elastic properties of thermal barrier coatings (TBC's) is important for failure prediction. Thermally sprayed coatings often exhibit anisotropic and nonlinear elastic properties due to the coating microstructure that results from the thermal spray process. A method was developed for determining the elastic behavior of TBC's on substrates by measuring the in-plane modulus as a function of residual coating stress. The in-plane modulus was determined by resonant frequency measurement, and the residual stress was measured from the substrate curvature. The residual stress was varied both by increasing the temperature of the TBC and substrate and by applying compressive plastic strain to the metal substrate. The stress-strain behavior of the TBC was derived from the data for modulus versus residual stress, and significant nonlinear elastic behavior was observed.

23890 (DOE/OR/22041–T2) **Low temperature fabrication from nano-size ceramic powders.** Gonzalez, E.J. (and others); Piermarini, G.J.; Hockey, B. National Inst. of Standards and Technology (MSEL), Gaithersburg, MD (United States). Ceramics Div. [1995]. 79p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI05-92OR22041. Order Number DE95013505. Source: OSTI; NTIS; GPO Dep.

The objective of the compaction process is to produce a dense green-state compact from a nanosize powder that subsequently can be sintered at high temperatures to form a dense ceramic piece. High density in the green-state after pressing is of primary importance for achieving high densities after sintering. Investigation of the compaction behavior of ceramic powders, therefore, is an important part of characterization of raw ceramic powders and evaluation of their compaction behavior, analysis of interaction between particles, and the study of microstructure of green body (unsintered) during pressure-forming processes. The compaction of nanosize ceramic particles into high density green bodies is very difficult. For the nanosize materials used in this study (amorphous Si_3N_4 and γ Al_2O_3), there is no evidence by TEM of partial sintering after synthesis. Nevertheless, strong aggregation forces, such as the van der Waals surface forces of attraction, exist and result in moderate precursor particle agglomeration. More importantly, these attractive surface forces, which increase in magnitude with decreasing particle size, inhibit interparticle sliding necessary for particle rearrangement to denser bodies during subsequent compaction. Attempts to produce high density green body compacts of nanosize particles, therefore, generally have been focused on overcoming these surface forces of attraction by using either dispersive fluids or high pressures with or without lubricating liquids. In the present work, the use of high pressure has been employed as a means of compacting nanosize powders to relatively high green densities.

23891 (DOE/PC/93219–T5) **Novel carbon-ion fuel cells. First quarter 1995 technical progress report.** Cocks, F.H.; LaViers, H. Duke Univ., Durham, NC (United States). Dept. of Mechanical Engineering and Materials Science. 18 Apr 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93219. Order Number DE95015606. Source: OSTI; NTIS; GPO Dep.

Research continued on task 2, the measurements on carbides with the fluorite structure. There are twelve known carbides of the fluorite structure with transition temperatures from 350-1450 C. Small quantities of these carbides in powder form will be purchased when commercially available. Pellets pressed from powder within an inert atmosphere will be made, CVI treated, and tested as described in Task No. 1. Pure carbides will be tested first, followed by carbides doped with impurities of different electrical valences whose atomic radii are favorable for solubility in the carbide lattice structure. Dopants will be introduced either during the chemical formation of the carbide, by mix and sinter diffusion, or by high energy ion bombardment of the powder prior to pelletization. The approximate time period for completion of Task No. 2 is twelve months. Investigations have been hampered by equipment failures. Progress is described.

23892 (FhG-IWM-W–2/95) **Mechanical behaviour during sintering - diffusion models and their verification for ZrO_2.**

Zipse, H. Fraunhofer-Institut fuer Werkstoffmechanik, Freiburg im Breisgau (Germany). Feb 1995. 156p. (In German). Order Number DE95795878. Source: OSTI; NTIS (US Sales Only).

The report describes attempts for modelling of the mechanical behaviour during solid-phase sintering. The work comprises the development of a theoretical model, sintering experiments with externally applied loads, and simulation calculations of sintering experiments in order to compare the theoretical and experimental values. A model of the central sintering stage based on diffusion processes is derived from microscopic assumptions, using a constitutive formulation with the three parameters: Compression viscosity, stearing viscosity, and sintering stress. Sintering forming experiments were carried out on tetragonally stabilized zirconium dioxide in order to determine the model parameters and to compare different models. A cylindrical powder preform is exposed to pressure on its front face during sintering. The diameter and height of the cylinder are scanned permanently during sintering, and the radial and axial strain rate are derived from these data. (orig./RHM)

23893 (JAERI-Tech–95-009) **Trial fabrication and preliminary characterization of electrical insulator for liquid metal system.** Nakamichi, Masaru (Japan Atomic Energy Research Inst., Oarai, Ibaraki (Japan). Oarai Research Establishment); Kawamura, Hiroshi; Oyamada, Rokuro. Japan Atomic Energy Research Inst., Tokyo (Japan). Mar 1995. 50p. Order Number DE95789300. Source: OSTI; NTIS; INIS.

In the design of the liquid metal blanket, MHD pressure drop is one of critical issues. Ceramic coating on the surface of structural material is considered as an electrical insulator to reduce the MHD pressure drop. Ceramic coating such as Y_2O_3 is a promising electrical insulator due to its high electrical resistivity and good compatibility with liquid lithium. This report describes the trial fabrication and preliminary characterization of electrical insulator for a design study of the liquid metal system. From the results of trial fabrication and preliminary characterization, it is concluded that densified atmospheric plasma spray Y_2O_3 coating with 410SS undercoating between 316SS substrate and Y_2O_3 coating is suitable for Y_2O_3 coating fabrication. (author).

23894 (LA-UR–95-1324) **Relationships between processing temperature and microstructure in isothermal melt processed Bi-2212 thick films.** Holesinger, T.G.; Phillips, D.S.; Willis, J.O.; Peterson, D.E. Los Alamos National Lab., NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941013–38: Applied superconductivity conference, Boston, MA (United States), 16-21 Oct 1994). Order Number DE95012070. Source: OSTI; NTIS; GPO Dep.

The microstructure and phase assemblage of isothermal melt processed (IMP) $Bi_2Sr_2CaCu_2O_y$ (Bi-2212) thick films have been evaluated. Results from compositional analysis and phase identification indicate that the characteristics of the partial melt greatly influence the microstructural and chemical development of the thick films. The highest critical current densities were obtained in films processed below 800°C where the partial melt uniformly coats the substrate without excessive phase segregation.

23895 (PNL-SA–26298) **Processing & properties $La_{1-x}A_xCo_{1-y}Fe_yO_3$(A = Sr, Ca) perovskites.** Stevenson, J.W. (and others); Armstrong, T.R.; Pederson, L.R. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950401–17: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 may 1995). Order Number DE95014170. Source: OSTI; NTIS; GPO Dep.

Selected compositions within the system $La_{1-x}A_xCo_{1-y}Fe_yO_{3-\delta}$(A = Sr, Ca) were prepared by combustion synthesis and characterized by XRD, TGA, electrical conductivity, and oxygen permeation measurements. Substantial weight loss (due to loss of lattice oxygen) was observed in some compositions at high temperatures. For Sr containing materials, this weight loss increased with increasing Sr content. A substantial decrease in electronic conductivity was observed at high temperatures in Sr doped materials; this decrease was related to the decreased oxygen stoichiometry at these temperatures. In Sr doped compositions, oxygen flux increased with increasing Sr content. Calculated values of ionic conductivity were greater than the conductivity of yttria stabilized zirconia. Substitution of Ca for Sr resulted in substantially lower fluxes.

23896 (PNL-SA–26451) **In situ MeV ion beam analysis of ceramic surfaces modified by 100-400 keV ion irradiation.** Weber, W.J. (Pacific Northwest Lab., Richland, WA (United States)); Yu, N.; Sickafus, K.E. Pacific Northwest Lab., Richland, WA (United States). May 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9505122–2: International conference on ion beam analysis, Tempe, AZ (United States), 22-26 May 1995). Order Number DE95014623. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes use of the in situ ion beam analysis facility developed at Los Alamos National Laboratory for the study of irradiation effects in ceramic materials. In this facility, an analytical beamline of 3 MV tandem accelerator and an irradiation bean-dine of 200 kV ion implanter are connected at 60° to a common target chamber. This facility provides a fast, efficient, and quantitative measurement tool to monitor changes of composition and crystallinity of materials irradiated by 100-400 keV ions, through sequential measurement of backscattering events of MeV ions combined with ion channeling techniques. We will describe the details of the in situ ion beam analysis and ion irradiation and discuss some of the important issues and their solutions associated with the in situ experiment. These issues include (1) the selection of axial ion channeling direction for the measurement of radiation damage; (2) surface charging and charge collection for data acquisition; (3) surface sputtering during ion irradiation; (4) the effects of MeV analytical beam on the materials; and (5) the sample heating effect on ion beam analysis.

23897 (UCRL-JC–120259) **Resonant soft x-ray fluorescence studies of novel materials.** Carlisle, J.A. (Lawrence Livermore National Lab., CA (United States)); Terminello, L.J.; Hudson, E.A.; Shirley, E.L.; Jia, J.J.; Callcott, T.A.; Himpsel, F.J.; Ederer, D.L. Lawrence Livermore National Lab., CA (United States); Oak Ridge National Lab., TN (United States); Lawrence Berkeley Lab., CA (United States). 8 Feb 1995. 8p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States);Science Alliance Center of Excellence (United States). DOE Contract W-7405-ENG-48 ; AC05-84OR21400 ; AC03-76SF00098. Grant DMR-9017996; Grant DMR-9017997. (CONF-941144–161: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95013462. Source: OSTI; NTIS; INIS; GPO Dep.

The authors are using resonant soft x-ray fluorescence at the Advanced Light Source to probe the electronic and geometric structure of novel materials. In the resonant process, a core electron is excited by a photon whose energy is near the core binding energy. In this energy regime the absorption and emission processes are coupled, and this coupling manifests itself in several ways. In boron nitride (BN), the resonant emission spectra reflect the influence of a "spectator" electron in an unoccupied excitonic state. The resonant emission can be used to distinguish between the various bulk phases of BN, and can also be used to probe the electronic structure of a monolayer of BN buried in a bulk environment, where it is inaccessible to electron spectroscopies. For highly-oriented pyrolytic graphite (HOPG) a coherent absorption-emission process takes place in the resonant regime, whereby crystalline momentum is conserved between the core excited electron and the valence hole which remains after emission.

23898 (ANL/CHM/CP–86590) **High resolution transmission electron microscopy study of diamond films grown from fullerene precursors.** Luo, J.S. (and others); Gruen, D.M.; Krauss,

A.R. Argonne National Lab., IL (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950518–12: 187. meeting of the Electrochemical Society, Reno, NV (United States), 21-26 May 1995). Order Number DE95013772. Source: OSTI; NTIS; GPO Dep.

High-resolution transmission electron microscopy (HRTEM) has been used to investigate the microstructure of diamond films grown by plasma-assisted chemical vapor deposition using fullerene precursors. HRTEM observations of as-grown films revealed an array of larger crystals (>200 nm) within a polycrystalline matrix of much smaller crystallites (<20 nm). The randomly oriented small crystallites were nearly free of structural imperfections such as stacking faults or twins, while the larger ones had preferred <110> orientations with respect to the Si (100) substrate and showed evidence of structural defects on the periphery of the crystals. The most common defects were V-shaped Σ9 twin boundaries, which are generally believed to serve as re-entrant sites for diamond nucleation and growth. The observation of growth steps on both (111) and (110) surfaces seems to support a reaction model in which fragments of C_{60}, including C_2, are considered the growth species. In particular, the nanocrystallinity of the films is most likely due to a high carbon cluster density from C_{60} fragmentation at or near the diamond surface, which can serve as nucleation sites for the growth of new crystallites.

23899 (ANL/CMT/CP–84525) **Performance testing of West Valley Reference 6 glass.** Ebert, W.L. (Argonne National Lab., IL (United States). Chemical Technology Div.); Bates, J.K. Argonne National Lab., IL (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950570–26: International high-level radioactive waste management conference: progress toward understanding, Las Vegas, NV (United States), 1-5 May 1995). Order Number DE95013442. Source: OSTI; NTIS; INIS; GPO Dep.

The chemical durability of West Valley Reference 6 glass is being evaluated by using a suite of laboratory tests which highlight the early, interim, and long-term stages of corrosion. The test results are being used to describe the glass corrosion path and its long-term durability. The long-term durability of the SRL Environmental Assessment glass is being evaluated for comparison. Test results also provide parameter values for an analytical corrosion model that can be used in performance assessments of specific disposal sites.

23900 (ANL/CMT/CP–84719) **The corrosion behavior of DWPF glasses.** Ebert, W.L. (Argonne National Lab., IL (United States). Chemical Technology Div.); Bates, J.K. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950401–6: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 may 1995). Order Number DE95013466. Source: OSTI; NTIS; INIS; GPO Dep.

The authors analyzed the corroded surfaces of reference glasses developed for the Defense Waste Processing Facility (DWPF) to characterize their corrosion behavior. The corrosion mechanism of nuclear waste glasses must be known in order to provide source terms describing radionuclide release for performance assessment calculations. Different DWPF reference glasses were corroded under conditions that highlighted various aspects of the corrosion process and led to different extents of corrosion. The glasses corroded by similar mechanisms, and a phenomenological description of their corrosion behavior is presented here. The initial leaching of soluble glass components results in the formation of an amorphous gel layer on the glass surface. The gel layer is a transient phase that transforms into a layer of clay crystallites, which equilibrates with the solution as corrosion continues. The clay layer does not act as a barrier to either water penetration or glass dissolution, which continues beneath it, and may eventually separate from the glass. Solubility limits for glass components may be established by the eventual precipitation of secondary phases; thus, corrosion of the glass becomes controlled by the chemical equilibrium between the solution and the assemblage of secondary phases. In effect, the solution is an intermediate phase through which the glass transforms to an energetically more favorable assemblage of phases. Implications regarding the prediction of long-term glass corrosion behavior are discussed.

23901 (ANL/CMT/CP–84722) **Laboratory testing of LITCO glasses.** Ellison, A. (Argonne National Lab., IL (United States). Chemical Technology Div.); Wolf, S.; Buck, E.; Luo, J.S.; Dietz, N.; Bates, J.K.; Ebert, W.L. Argonne National Lab., IL (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950401–7: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 may 1995). Order Number DE95013465. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this program is to measure, the intermediate and long-term durability of glasses developed by Lockheed Idaho Technology Co. (LITCO) for the immobilization of calcined radioactive wastes. The objective is to use accelerated corrosion tests as an aid in developing durable waste form compositions. This is a report of tests performed on two LITCO glass compositions, Formula 127 and Formula 532. The main avenue for release of radionuclides into the environment in a geologic repository is the reaction of a waste glass with ground water, which alters the glass and releases its components into solution. These stages in glass corrosion are analyzed by using accelerated laboratory tests in which the ratio of sample surface area to solution volume, SA/V, is varied. At low SA/V, the solution concentrations of glass corrosion products remain low and the reaction approaches the forward rate. At higher SA/V the solution approaches saturation levels for glass corrosion products. At very high SA/V the solution is rapidly saturated in glass corrosion products and secondary crystalline phases precipitate. Tests at very high SA/V provide information about the composition of the solution at saturation or, when no solution is recovered, the identities and the order of appearance of secondary crystalline phases. Tests were applied to Formula 127 and Formula 532 glasses to provide information about the interim and long-term stages in glass corrosion.

23902 (ANL/MSD/CP–86064) **Simulation of ionic surfaces from an absolutely convergent solution of the Madelung problem.** Wolf, D. Argonne National Lab., IL (United States). Apr 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9502105–1: International workshop on computer simulation in condensed matter physics, Athens, GA (United States), 20-24 Feb 1995). Order Number DE95013389. Source: OSTI; NTIS; GPO Dep.

The classic Madelung problem is cast into an absolutely convergent form that is readily evaluated by direct lattice summation, revealing a net r^{-5} range of the net Coulomb potential in ionic crystals and liquids. The realization that Coulomb interactions in condensed systems can actually be rather short ranged (provided the system is overall neutral) leads to the prediction, verified by computer simulations for rocksalt-structure surfaces, that all surfaces in predominantly ionic crystals should be fundamentally reconstructed. The work also provides a conceptual framework for the theoretical treatment of polar surfaces, as demonstrated for the case of the (111) surfaces of NaCl and MgO.

23903 (CONF-9410244–2) **Characterization of residual stresses in graded ceramic-metal structures: A comparison of diffraction experiments and FEM calculations.** Rabin, B.H. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Williamson, R.L.; Watkins, T.R.; Wang, X.L.; Hubbard, C.R.; Spooner, S. Oak Ridge National Lab., TN (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 3. international symposium on structural and functional gradient materials; Lausanne (Switzerland); 10-12 Oct 1994. Order Number DE95013225. Source: OSTI; NTIS; GPO Dep.

Numerical models have been extensively developed for predicting the thermomechanical behavior of ceramic-metal joints containing graded interlayers. The goal of such modeling is to be able to design optimum interlayer microstructural characteristics required to meet the needs of specific application conditions, and to use this design information to guide component fabrication. The graded specimen examined in this research was fabricated by powder processing methods. Al_2O_3-Ni was selected as a model system. The residual stresses expected in the specimen were predicted by FEM

calculations using an elastic-plastic model. Strain and stress distributions in the specimen were characterized experimentally using x-ray and neutron diffraction techniques. Preliminary neutron and x-ray diffraction measurements were not in very good agreement with FEM model predictions, particularly regarding the in-plane stresses along the axis of symmetry. These results suggest additional diffraction measurements on graded specimens having fewer interlayers should be carried out, and experimental verification of the constitutive assumptions used in the FEM model is needed.

23904 (CONF-950245–3) **Ceramic composites with a ductile Ni_3Al binder phase.** Tiegs, T.N.; Alexander, K.B.; Plucknett, K.P.; Menchhofer, P.A.; Becher, P.F.; Waters, S.B. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 5. international conference on the science of hard materials; Maui, HI (United States); 20-24 Feb 1995. Order Number DE95013352. Source: OSTI; NTIS; GPO Dep.

Composites using B-doped ductile Ni_3Al alloys were produced with both non-oxide (WC, TiC) and oxide (Al_2O_3) ceramic powders. Typical powder processing techniques were used to fabricate materials with ceramic contents from 0-95 vol. %. The microstructural morphology of the composites depends primarily on the wetting behavior between the alloys and the ceramic powders. The non-oxide ceramic powders wet well and the Ni_3Al alloys form a semi-continuous intergranular phase. On the other hand, the Ni_3Al alloys do not wet the oxide powders well and tend to form discrete "islands" of the metallic phase. Wetting in these materials can be improved by the addition of non-oxide particles, such as TiC. Results on the mechanical properties showed ambient temperature flexural strength similar to other Ni-based hardmetals. In contrast to the WC-Co materials, the flexural strength is retained to temperatures of at least 800 C. The fracture toughness and hardness were found to be equal or higher than comparable Co-based hardmetal systems. Initial corrosion tests showed excellent resistance to acid solutions.

23905 (CONF-9503144–2) **Investigation of optical loss mechanisms in oxide thin films.** Chow, A.F. (North Carolina State Univ., Raleigh, NC (United States)); Kingon, A.I.; Auciello, O.; Poker, D.B. Oak Ridge National Lab., TN (United States). May 1995. 12p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. From 7. international symposium on integrated ferroelectrics; Colorado Springs, CO (United States); 20-22 Mar 1995. Order Number DE95014270. Source: OSTI; NTIS; GPO Dep.

$KNbO_3$, $K(Ta,Nb)O_3$, $KTaO_3$, and Ta_2O_5 thin films have been grown by ion-beam sputter deposition. $KNbO_3$ has excellent nonlinear properties for second harmonic generation; however, high optical losses are still characteristic of these films. Several loss mechanisms, such as, high angle grain boundaries, twin domains, interface and surface scattering, and oxygen vacancies can all contribute to the high losses. In order to isolate the various mechanisms, amorphous Ta_2O_5 films, epitaxial cubic $KTaO_3$ and tetragonal $K(Ta,Nb)O_3$ films were grown on MgO and Al_2O_3 substrates subjected to post-deposition annealing treatments and various oxygen pressure conditions. The optical losses and refractive indices were observed to differ depending on the substrate surface and annealing treatments. Resonant scattering experiments were performed to analyze the oxygen composition. The optical properties of these oxide thin film systems are reported and the breakdown of the loss mechanisms is addressed.

23906 (CONF-950412–16) **Nanoindentation and nanoscratching of hard carbon coatings for magnetic disks.** Tsui, T.Y. (Rice Univ., Houston, TX (United States). Dept. of Materials Science); Pharr, G.M.; Oliver, W.C.; Bhatia, C.S.; White, R.L.; Anders, S.; Anders, A.; Brown, I.G. Oak Ridge National Lab., TN (United States); Oak Ridge Associated Universities, Inc., TN (United States); Lawrence Berkeley Lab., CA (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States);Oak Ridge Inst. for Science and Education, TN (United States). DOE Contract AC05-84OR21400 ; AC05-76OR00033 ; AC03-76SF00098. From Spring meeting of the Materials Research Society (MRS); San Francisco, CA (United States); 17-21 Apr 1995. Order Number DE95013211. Source: OSTI; NTIS; GPO Dep.

Nanoindentation and nanoscratching experiments have been performed to assess the mechanical properties of several carbon thin films with potential application as wear resistant coatings for magnetic disks. These include three hydrogenated-carbon films prepared by sputter deposition in a H_2/Ar gas mixture (hydrogen contents of 20, 34, and 40 atomic %) and a pure carbon film prepared by cathodic-arc plasma techniques. Each film was deposited on a silicon substrate to thickness of about 300 run. The hardness and elastic modulus were measured using nanoindentation methods, and ultra-low load scratch tests were used to assess the scratch resistance of the films and measure friction coefficients. Results show that the hardness, elastic modulus, and scratch resistance of the 20 and 34% hydrogenated films are significantly greater than the 40% film, thereby showing that there is a limit to the amount of hydrogen producing beneficial effects. The cathodic-arc film, with a hardness of greater than 59 GPa, is considerably harder than any of the hydrogenated films and has a superior scratch resistance.

23907 (CONF-950412–21) **Amorphous diamond-like carbon film growth by KrF- and ArF- excimer laser PLD: Correlation with plume properties.** Puretzky, A.A. (Institute of Spectroscopy, Troitsk (Russian Federation)); Geohegan, D.B.; Jellison, G.E. Jr. Oak Ridge National Lab., TN (United States). Apr 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Spring meeting of the Materials Research Society (MRS); San Francisco, CA (United States); 17-21 Apr 1995. Order Number DE95013987. Source: OSTI; NTIS; GPO Dep.

A comparative study of ArF- and KrF-laser deposition of amorphous diamond-like carbon (DLC) films and relevant carbon plasmas has been performed. Spectroscopic ellipsometry and EELS analysis of the DLC films deposited on Si <100> and NaCl substrates were utilized to characterize the high quality ArF- and KrF-laser deposited films (up to 84% of sp^3 bonded carbon in 7 J/cm^2 -ArF-laser DLC film). Gated ICCD imaging, luminescence and ion current probe diagnostics of the carbon plume have revealed quite different properties of carbon plasmas generated by ArF- and KrF- lasers. KrF-laser (6.7 J/cm^2) irradiation produces a less energetic carbon plasma containing larger amounts of C_2 and probably larger clusters compared with ArF-laser irradiation at the same energy fluence. We conclude that the more energetic and highly-atomized ArF-laser carbon plasma results in the better diamond-like properties.

23908 (DOE/ER/13662–T3) **Energy changes in transforming solids. Final report, January 31, 1991–January 31, 1995.** Herrmann, G.; Barnett, D.M. Stanford Univ., CA (United States). 3 Apr 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-87ER13662. Order Number DE95012448. Source: OSTI; NTIS; GPO Dep.

The following topics are discussed: A new thermodynamical theory of continuum damage mechanics capable of incorporating non-isothermal processes and of providing explicit expressions for the thermal dissipation during damage evolution; the advancement of the methodology of heterogenization to analyze elastic bodies with defects; and investigations of bonded dissimilar piezoelectric half-spaces.

23909 (DOE/ER/45278–T3) **Defect studies in thin film III-V thin film semiconductors. Progress report, September 1986–May 1987.** Ast, D.G. Cornell Univ., Ithaca, NY (United States). Dept. of Materials Science and Engineering. May 1987. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER45278. Order Number DE95013306. Source: OSTI; NTIS; GPO Dep.

Progress is reported on the following: defect formation at the InGaAs/GaAs interface as a function of the misfit parameter, layer thickness, and starting substrate dislocation density; and epitaxial growth on very small islands to verify theoretical predictions of critical layer thickness as a function of area.

23910 (DOE/ER/45278–T4) **Nucleation, propagation, electronic levels and elimination of misfit dislocations in III-V**

semiconductor interfaces. Final report, September 1, 1986–August 31, 1993. Ast, D.G.; Watson, G.P.; Matragrano, M. Cornell Univ., Ithaca, NY (United States). Mar 1995. 292p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER45278. Order Number DE95013305. Source: OSTI; NTIS; GPO Dep.

Misfit dislocations in gallium arsenides, indium arsenides, and zinc selenides are discussed. The growth of strained epitaxial layers, isolation and nucleation, thermal stability, and electronic and structural characteristics of misfit dislocations are described.

23911 (DOE/ID/13236–T1) **Development of lead-free copper alloy-graphite castings. Technical report, January 1994–December 1994.** Rohatgi, P.K. Wisconsin Univ., Milwaukee, WI (United States). [1995]. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC07-93ID13236. Order Number DE95015157. Source: OSTI; NTIS; GPO Dep.

Water model experiments were conducted to develop a two-stage stirring method for obtaining higher yields and a more uniform distribution of graphite particles in copper alloys. This was followed by several melts for synthesis of copper-graphite alloys in which Ti was used as a wetting agent to improve the wettability of graphite in the copper melt. In the first stage, a vortex method was employed to facilitate the addition of graphite particles into the copper melt. In the second stage, a specially designed stirrer was used for uniform particle distribution while avoiding the formation of vortex in the melt. The two-stage stirring was found to considerably improve the recovery of graphite, over those obtained with the prior practice of single-stage stirring and resulting in a more uniform particle distribution. In addition, graphite recoveries increased with increasing Ti content in the range investigated. Floatation, fluidity, and directional solidification experiments were also conducted on copper-graphite alloys synthesized in this study. Fluidity tests showed that the spiral fluidity length of the yellow brass alloy increased with temperature and decreased with graphite. The fluidity of copper-graphite alloys investigated to-date remained adequate to make a variety of castings. The observations of casting microstructure under directional solidification and floatation showed that in certain castings the graphite particles remained agglomerated, and they readily floated to the upper part of the castings where they reduced the size of gains. However, even in the agglomerated form, the graphite particles improved the machinability of copper alloys in a manner similar to lead. The results of the first year work provide an improved method of synthesis of lead free copper graphite alloys with improved machinability and adequate fluidity.

23912 (DOE/PC/94222–2) **Tunable composite membranes for gas separations. Progress report, January 1995–April 1995.** Ferraris, J.P.; Balkus, K.J. Jr.; Musselman, I.H. Texas Univ., Richardson, TX (United States). Dept. of Chemistry. Apr 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94PC94222. Order Number DE95015603. Source: OSTI; NTIS; GPO Dep.

Research continued on membrane technology. This period, progress is reported on polymer (thiophenes) synthesis and construction of a computer controlled permeameter.

23913 (DOE/SF/19888–T1) **Lighting research - porous silicon phosphors. Final technical report.** Solanki, R. Oregon Graduate Inst. of Science and Technology, Portland, OR (United States). Dept. of Electrical Engineering and Applied Physics. [1995]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-93SF19888. Order Number DE95015115. Source: OSTI; NTIS; GPO Dep.

The objective of this project was to investigate the use of porous silicon as a possible efficient phosphor for lighting applications. The preparation, by means of electroetching, is described.

23914 (JAERI-Tech–95-007) **Radiation effects on carbon fiber-reinforced plastics for spacecraft materials.** Udagawa, Akira (Japan Atomic Energy Research Inst., Takasaki, Gunma (Japan). Takasaki Radiation Chemistry Research Establishment); Kudoh, Hisaaki; Sasuga, Tsuneo; Morino, Yoshiki; Seguchi, Tadao; Yudate, Kozo. Japan Atomic Energy Research Inst., Tokyo (Japan). Feb 1995. 31p. (In Japanese). Order Number DE95789253. Source: OSTI; NTIS; INIS.

The effects of space environment were studied for two kinds of carbon fiber-reinforced plastics(CFRP) which were an epoxy resin composite using construction materials of satellite and a polyimide(PMR-15) composite expecting bright future space materials for long term operation. Resistibility of these materials to the space environments were evaluated from the change of mechanical properties after exposure of electron, proton, atomic oxygen and thermal cycling. It was found that the CFRP with PMR-15 as a matrix had good performance in the space environments. No differences in the mechanical properties for the materials were observed between proton and electron irradiations. (author).

23915 (LA-UR–95-1245) **Preparation of diamond-like carbon and boron nitride films by high-intensity pulsed ion beam deposition.** Rej, D.J. (Los Alamos National Lab., NM (United States)); Davis, H.A.; Remnev, G.E. Los Alamos National Lab., NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950840–2: International conference on applications of diamond films and related materials, Gaithersburg, MD (United States), 21-24 Aug 1995). Order Number DE95012076. Source: OSTI; NTIS; GPO Dep.

Intense ion beams (300-keV C^+, O^+, and H^+, 20–30 kA, 50 to 400-ns pulsewidth, up to 0.3-Hz repetition rate) were used to prepare diamond-like carbon (DLC) and boron nitride (BN) films. Deposition rates of up to 25±5 nm/pulse were obtained with instantaneous rates exceeding 1 mm/s. Most films were uniform, light brown, translucent, and nonporous with some micron-size particulates. Raman and parallel electron energy loss spectroscopy indicated the presence of DLC. The films possessed favorable electron field-emission characteristics desirable for cold-cathode displays. Transmission electron microscopy (TEM) and transmission electron diffraction (TED) revealed that the C films contained diamond crystals with 25 to 125-nm grain size. BN films were composed of hexagonal, cubic and wurtzite phases.

23916 (LA-UR–95-1463) **Characterization of three dimensional fiber orientation in short-fiber composites.** Zhu, Yuntian T.; Blumenthal, W.R. Los Alamos National Lab., NM (United States). [1995]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-951026–1: Fall meeting of the Minerals, Metals and Materials Society: physical metallurgy and materials, Cleveland, OH (United States), 29 Oct - 2 nov 1995). Order Number DE95010986. Source: OSTI; NTIS; GPO Dep.

A mathematical procedure for recovering from image analysis the three dimensional nonsymmetric fiber-orientation distribution in short-fiber composites is proposed. Microphotographs from two orthogonal faces of a composite sample are needed to determine the three dimensional fiber orientation. A simple weighting function is derived to take into account the probability of intercepting fibers at varying inclination angles. The present procedure improves the previous works of other researchers in the following two aspects. First, it can obtain the single-angle fiber-orientation distribution from one micrograph in reference to the normal of the photographed surface. This distribution is often needed in predicting the mechanical and physical properties of short-fiber composites in this direction. Second, no symmetry in fiber-orientation distribution is assumed in the determination of the three dimensional fiber-orientation, which makes the present procedure more practical and versatile.

23917 (LA-UR–95-1464) **Direct fiber strengthening in three dimensional random-oriented short-fiber composites.** Zhu, Y.T.; Blumenthal, W.R. Los Alamos National Lab., NM (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-951026–3: Fall meeting of the Minerals, Metals and Materials Society: physical metallurgy and materials, Cleveland, OH (United States), 29 Oct - 2 nov 1995). Order Number DE95011998. Source: OSTI; NTIS; GPO Dep.

A theory for direct fiber strengthening in random-oriented short-fiber composites is developed. It adopts a maximum load composite failure criterion and takes into account the fiber orientation effect on the probability of a fiber being intercepted by a specimen cross-section. The strain and load of short fibers with different inclination angles with respect to the loading direction were

first calculated, and their contribution in carrying load toward the composite load direction was integrated to give the total load. The fibers with smaller inclination angles bear greater stress and break first. This load is then transferred to fibers with larger inclination angles. Direct fiber strengthening component of the composite strength was calculated from the maximum total load these short fibers can carry. The present theory predicts a much greater direct short-fiber strengthening than does previous theories, and provides useful information for composite design and strength assessment.

23918 (LA-UR–95-1520) **Characterizing size dependence of ceramic-fiber strength using modified Weibull distribution.** Zhu, Yuntian; Blumenthal, W.R. Los Alamos National Lab., NM (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-951026–2: Fall meeting of the Minerals, Metals and Materials Society: physical metallurgy and materials, Cleveland, OH (United States), 29 Oct - 2 nov 1995). Order Number DE95011985. Source: OSTI; NTIS; GPO Dep.

The strengths of ceramic fibers have been observed to increase with decreasing fiber diameter and length. The traditional single-modal Weibull distribution function can only take into account one type of flaw, which makes it inappropriate to characterize the strength dependence of both the diameter and the length since ceramic fibers usually have both volume and surface flaws which affect the strength dependence in different ways. Although the bi-modal Weibull distribution can be used to characterize both volume and surface flaws, the mathematical difficulty in its application makes it undesirable. In this paper, the factors affecting fiber strength are analyzed in terms of fracture mechanics and flaw formation. A modified Weibull distribution function is proposed to characterize both the diameter dependence and the length dependence of ceramic fibers.

23919 (LBL–37379) **The picosecond dynamics of electron-hole pairs in graded and homogeneous CdS_xSe_{1-x} semiconductors.** Hane, J.K. Lawrence Livermore National Lab., CA (United States). May 1995. 103p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95016457. Source: OSTI; NTIS; GPO Dep.

Wavelength and composition dependence of the time-resolved luminescence were examined. Effects of macroscopic composition gradient and microscopic alloy disorder on e^--h^+ pair dynamics were probed. Materials with both increasing and decreasing S content with distance from the surface were examined, where $0 \leq x \leq 1$ over the full range. In these graded materials, the band gap energy also varies with position. The graded semiconductor luminescence shows strong wavelength dependence, showing diffusion in both band gap and concentration gradients. A bottleneck in the diffusion is attributed to localization occurring primarily in the materials with greatest alloy disorder, i.e. around $CdS_{0.5}Se_{0.50}$. Homogeneous materials were studied for x = 0, 0.25, 0.50, 0.75, 1; the time-resolved luminescence depends strongly on the composition. The mixed compositions have longer decay constants than CdS and CdSe. Observed lifetimes agree with a picture of localized states induced by the alloy disorder. For a given homogeneous crystal, no wavelength dependence of the time decays was observed. Picosecond luminescence upconversion spectroscopy was used to study further the dependence of the luminescence on composition. Large nonexponential character in the decay functions was observed in the alloys; this long time tail can be attributed to a broad distribution of relaxation times as modeled by the Kohlrausch exponential.

23920 (LBL-PUB–754, pp. 13-18) **A study of the suitability of ferrite for use in low-field insertion devices.** Johnson, K.; Hassenzahl, W.V. Lawrence Berkeley Lab., CA (United States). Feb 1995. In *The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.* 202p. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

Most insertion devices built to date use rare-earth permanent-magnet materials, which have a high remanent field and are more expensive than many other permanent-magnet materials. Low-field insertion devices could use less-expensive, lower performance magnetic materials if they had suitable magnetic characteristics. These materials must be resistant to demagnetization during construction and operation of the insertion device, have uniform magnetization, possess low minor-axis magnetic moments, and have small minor field components on the surfaces. This paper describes an investigation to determine if ferrite possesses magnetic qualities suitable for insertion device applications. The type of ferrite investigated, MMPA Ceramic 8 from Stackpole Inc., was found to be acceptable for insertion device applications.

23921 (PNL–10562) **Accelerated aging studies and environmental stability of prototype tamper tapes.** Wright, B.W. (Pacific Northwest Lab., Richland, WA (United States)); Wright, C.W.; Bunk, A.R. Pacific Northwest Lab., Richland, WA (United States). May 1995. 87p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95012941. Source: OSTI; NTIS; GPO Dep.

This report describes the results of accelerated aging experiments (weathering) conducted on prototype tamper tapes bonded to a variety of surface materials. The prototype tamper tapes were based on the patented Confirm® tamper-indicating technology developed and produced by 3M Company. Tamper tapes bonded to surfaces using pressure sensitive adhesive (PSA) and four rapid-set adhesives were evaluated. The configurations of the PSA-bonded tamper tapes were 1.27-cm-wide Confirm® 1700 windows with vinyl underlay and 2.54-cm-wide Confirm® 1700 windows with vinyl and polyester underlays. The configurations of the rapid-set adhesive-bonded tamper tapes were 2.54-cm-wide Confirm® (1700, 1500 with and without primer, and 1300) windows with vinyl underlay. Surfaces used for bonding included aluminum, steel, stainless steel, Kevlar®, brass, copper, fiberglass/resin with and without gel coat, polyurethane-painted steel, acrylonitrile:butadiene:styrene plastic, polyester fiberglass board, Lexan polycarbonate, and cedar wood. Weathering conditions included a QUV cabinet (ultraviolet light at 60°C, condensing humidity at 40°C), a thermal cycling cabinet (-18°C to 46°C), a Weather-O-Meter (Xenon lamp), and exposure outdoors in Daytona Beach, Florida. Environmental aging exposures lasted from 7 weeks to 5 months. After exposure, the tamper tapes were visually examined and tested for transfer resistance. Tamper tapes were also exposed to a variety of chemical liquids (including organic solvents, acids, bases, and oxidizing liquids) to determine chemical resistance and to sand to determine abrasion resistance.

23922 (SAND–94-0340) **Electrophoretically-deposited solid film lubricants.** Dugger, M.T.; Panitz, J.K.J.; Vanecek, C.W. Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95013556. Source: OSTI; NTIS; GPO Dep.

An aqueous-based process that uses electrophoresis to attract powdered lubricant in suspension to a charged target was developed. The deposition process yields coatings with low friction, complies with environmental safety regulations, requires minimal equipment, and has several advantages over processes involving organic binders or vacuum techniques. This work focuses on development of the deposition process, includes an analysis of the friction coefficient of the material in sliding contact with stainless steel under a range of conditions, and a functional evaluation of coating performance in a precision mechanical device application. Results show that solid lubricant films with friction coefficients as low as 0.03 can be produced. A 0.03 friction coefficient is superior to solid lubricants with binder systems and is comparable to friction coefficients generated with more costly vacuum techniques.

23923 (SAND–94-3244C) **High rate ECR etching of III-V nitride materials.** Shul, R.J. (Sandia National Labs., Albuquerque, NM (United States)); Howard, A.J.; Kilcoyne, S.P.; Pearton, S.J.; Abernathy, C.R.; Vartuli, C.B.; Barnes, P.A.; Bozack, M.J. Sandia National Labs., Albuquerque, NM (United States). [1994]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950518–6: 187. meeting of the Electrochemical Society, Reno, NV (United States), 21-26 May 1995). Order Number DE95013032. Source: OSTI; NTIS; GPO Dep.

The III-V nitride compound semiconductors are attracting considerable attention for blue and ultraviolet light emitting diodes (LEDs)

and lasers as well as high temperature electronics due to their wide band gaps and high dielectric constants. The recent progress observed in the growth of these materials has not been matched by progress in processing techniques to fabricate more highly sophisticated devices. Patterning these materials has been especially difficult due to the relatively inert chemical nature of the group-III nitrides. The authors review dry etch techniques which have been used to pattern these materials including electron cyclotron resonance (ECR), reactive ion etch (RIE), and chemically assisted ion beam etching (CAIBE). ECR etch rates greater than 3,800 Å/min for InN, 3,500 Å/min for GaN, and 1,170 A/min for AlN are reported. Etch anisotropy, surface morphology, and near-surface stoichiometry will be discussed.

23924 (SAND–95-0833C) **Damage evolution in metal matrix composites subjected to thermomechanical fatigue.** Allen, D.H. (Texas A and M Univ., College Station, TX (United States). Center for Mechanics of Composites); Hurtado, L.D.; Helms, K.L.E. Sandia National Labs., Albuquerque, NM (United States). [1995]. 4p. Sponsored by Department of the Air Force, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9505115–4: ASCE engineering mechanics conference, Boulder, CO (United States), 21-24 May 1995). Order Number DE95011896. Source: OSTI; NTIS; GPO Dep.

A thermomechanical analysis of unidirectional continuous fiber metal matrix composites is presented. The analysis includes the effects of processing induced residual thermal stresses, interface cracking, and inelastic matrix behavior on damage evolution. Due to the complexity of the nonlinear effects, the analysis is performed computationally using the finite element method. The interface fracture is modeled by a nonlinear constitutive model. The problem formulation is summarized and results are presented for a four-ply unidirectional SCS-6/β21S titanium composite under high temperature isothermal mechanical fatigue.

23925 (SAND–95-0869C) **Yield strength and stress relaxation data for an adhesive used in butt joint tests.** Guess, T.R.; Reedy, E.D. Jr. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-951033–1: 27. international technical conference of the Society for the Advancement of Material and Process Engineering: diversity into the next century, Albuquerque, NM (United States), 9-12 Oct 1995). Order Number DE95013866. Source: OSTI; NTIS; GPO Dep.

Mechanical property data are reported for Epon 828/T403, an amine-cured epoxy adhesive. Data include compression modulus, compression yield strength and compression stress relaxation as a function of stress level, strain rate, and temperature and Mode I fracture toughness as a function of temperature. This data was generated to support a study investigating how temperature effects joint strength and the corresponding interface corner fracture toughness for adhesively bonded butt joints.

23926 (SAND–95-0933C) **Bridged polysilsesquioxane xerogels: A molecular based approach for the preparation of porous hybrid organic-inorganic materials.** Small, J.H. (Univ. of California, Irvine, CA (United States). Dept. of Chemistry); Shea, K.J.; Loy, D.A. Sandia National Labs., Albuquerque, NM (United States). [1995]. 3p. Sponsored by National Science Foundation, Washington, DC (United States);Department of the Air Force, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950801–2: 210. national meeting of the American Chemical Society, Chicago, IL (United States), 20-25 Aug 1995). Order Number DE95012226. Source: OSTI; NTIS; GPO Dep.

Bridged polysilsesquioxanes represent an interesting family of hybrid organic-inorganic composite materials. It has been shown that manipulation of the organic bridging component offers the potential for the synthesis of a variety of materials with a range of surface areas and porosities. In addition, incorporation of a heteroatom within the bridging organic component allows for further chemical transformation of the polysilsesquioxane material.

23927 (SAND–95-1290C) **Diffusion in polycrystalline microstructures.** Swiler, T.P.; Holm, E.A. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950401–12: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 may 1995). Order Number DE95014217. Source: OSTI; NTIS; GPO Dep.

Mass transport properties are important in polycrystalline materials used as protective films. Traditionally, such properties have been studied by examining model polycrystalline structures, such as a regular array of straight grain boundaries. However, these models do not account for a number of features of real grain ensembles, including the grain size distribution and the topological aspects of grain boundaries. In this study, a finite difference scheme is developed to study transient and steady-state mass transport through realistic two-dimensional polycrystalline microstructures. Effects of microstructural parameters such as average grain size and grain boundary topology are examined, as are effects due to limits of the model.

23928 (SAND–95-1291C) **Semiempirical study of hydrogen addition to single-walled carbon nanotubes.** Cahill, P.A. Sandia National Labs., Albuquerque, NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950518–14: 187. meeting of the Electrochemical Society, Reno, NV (United States), 21-26 May 1995). Order Number DE95014606. Source: OSTI; NTIS; GPO Dep.

Single-walled carbon nanotube models have been constructed by insertion of 10-carbon bracelets into C_{70} to form C_{80} and C_{120}. Semiempirical heats of vicinal hydrogenation along the sides of the tubes are ~40 kcal/mol more endothermic (less stable) than addition to the endcaps. Based on the similarity of the endcaps to C_{60}, hydrogenation of nanotubes is estimated to be approximately thermoneutral; therefore, only relatively high energy dienes or other species are likely to yield stable addended products.

23929 (SAND–95-1320) **Polyelectrolyte gels.** Segalman, D.J.; Witkowski, W.R. Sandia National Labs., Albuquerque, NM (United States). Jun 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95015061. Source: OSTI; NTIS; GPO Dep.

Polyelectrolyte (PE) gels are swollen polymer/solvent networks that undergo a reversible volume collapse/expansion through various types of stimulation. Applications that could exploit this large deformation and solvent expulsion/absorption characteristics include robotic "fingers" and drug delivery systems. The goals of the research were to first explore the feasibility of using the PE gels as "smart materials" - materials whose response can be controlled by an external stimulus through a feedback mechanism. Then develop a predictive capability to simulate the dynamic behavior of these gels. This involved experimentally characterizing the response of well-characterized gels to an applied electric field and other stimuli to develop an understanding of the underlying mechanisms which cause the volume collapse. Lastly, the numerical analysis tool was used to simulate various potential engineering devices based on PE gels. This report discusses the pursuit of those goals through experimental and computational means.

23930 (UCRL-ID–119832) **Corrosion of candidate materials in Lake Rotokawa geothermal exposure.** Estill, J.C.; McCright, R.D. Lawrence Livermore National Lab., CA (United States). May 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015128. Source: OSTI; NTIS; GPO Dep.

Corrosion rates were determined for CDA 613, CDA 715, A-36 carbon steel, 1020 carbon steel, and Alloy 825 flat coupons which were exposed to geothermal spring water at Paraiki site number 9 near Lake Rotokawa, New Zealand. Qualitative observations of the corrosion performance of Type 304L stainless steel and CDA 102 exposed to the same environment were noted. CDA 715, Alloy 825, 1020 carbon steel, and other alloys are being considered for the materials of construction for high-level radioactive waste containers for the United States civilian radioactive waste disposal program. Alloys CDA 613 and CDA 102 were tested to provide copper-based materials for corrosion performance comparison purposes. A36 was tested to provide a carbon steel baseline material for comparison purposes, and alloy 304L stainless steel was tested

to provide an austenitic stainless steel baseline material for comparison purposes. In an effort to gather corrosion data from an environment that is rooted in natural sources of water and rock, samples of some of the proposed container materials were exposed to a geothermal spring environment. At the proposed site at Yucca Mountain, Nevada, currently under consideration for high-level nuclear waste disposal, transient groundwater may come in contact with waste containers over the course of a 10,000-year disposal period. The geothermal springs environment, while extremely more aggressive than the anticipated general environment at Yucca Mountain, Nevada, could have similarities to the environment that arises at selected local sites on a container as a result of crevice corrosion, pitting corrosion, microbiologically influenced corrosion (MIC), or the concentration of the ionic species due to repetitive evaporation or boiling of the groundwater near the containers. The corrosion rates were based on weight loss data obtained after six weeks exposure in a 90°C, low-pH spring with relatively high concentrations of SO_4^{2-} and Cl^-.

23931 (UCRL-ID–120162) **Enhancing tensile ductility of a particulate-reinforced aluminum MMC by lamination with Mg-9% Li alloy.** Syn, C.K. (Lawrence Livermore National Lab., CA (United States)); Lesuer, D.R.; Sherby, O.D. Lawrence Livermore National Lab., CA (United States). May 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95013917. Source: OSTI; NTIS; GPO Dep.

A laminated metal composite has been made by press bonding alternating layers of a particulate-reinforced aluminum MMC, 6090/SiC/25p, and a Mg-9%Li alloy. The mechanical properties including tensile ductility were evaluated. The tensile ductility of the Al MMC was found to increase from 3.5% to 11.5%. In contrast to other laminates based on ultrahigh carbon, steel, the laminate of this study and other Al MMC laminates exhibited tensile yield strengths that did not follow the rule of averages. This is attributed to interlayer reaction products developed during processing of the Al MMC laminates.

23932 (UCRL-JC–118164) **Failure characterization of nodular defects in multi-layer dielectric coatings.** Sawicki, R.H.; Shang, C.C.; Swatloski, T.L. Lawrence Livermore National Lab., CA (United States). 20 Dec 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9410155–4: 26. annual symposium on optical materials for high power lasers: Boulder damage symposium, Boulder, CO (United States), 24-26 Oct 1994). Order Number DE95014124. Source: OSTI; NTIS; INIS; GPO Dep.

Nodular defects in multi-layer dielectric coatings have been computer modeled to characterize the electro-mechanical responses to laser pulses with wavelengths of 1.06 μm and pulse lengths between 1 and 20 ns. The simulation begins with an axisymmetric electric field model using AMOS, a full-wave Maxwell solver with lossy (dispersive) electric and magnetic material models. Electric fields calculated by this code determine the spatial distribution of absorbed laser energy in the vicinity of the nodule. This data is linked to a thermal/stress model and mechanical calculations are executed using the general purpose finite element code COSMOS/M. The simulation estimates the transient temperature response of the nodule and the surrounding medium and predicts the dynamic stresses caused by the thermal impulse. This integrated computer process has been exercised to characterize failure of nodules as a function of defect characteristics, including seed size and depth.

23933 (UCRL-JC–118192) **Properties of transition metal-doped zinc chalcogenide crystals for tunable IR laser radiation.** DeLoach, L.D. (and others); Page, R.H.; Wilke, G.D. Lawrence Livermore National Lab., CA (United States). 17 Mar 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950101–5: Advanced solid-state laser conference, Memphis, TN (United States), 29 Jan - 1 feb 1995). Order Number DE95014370. Source: OSTI; NTIS; INIS; GPO Dep.

The spectroscopic properties of Cr^{2+}, Co^{2+}, and Ni^{2+}-doped single crystals of ZnS, ZnSe, and ZnTe have been investigated to understand their potential application as mid-IR tunable solid-state laser media. The spectroscopy indicated divalent Cr was the most favorable candidate for efficient room temperature lasing, and accordingly, a laser-pumped laser demonstration of Cr:ZnS and Cr:ZnSe has been performed. The lasers' output were peaked at ~ 2.35 μm and the highest measured slope efficiencies were ~ 20% in both cases.

23934 (UCRL-JC–118841) **Rapid growth of diamond-like-carbon films by copper vapor laser ablation.** McLean, W. (and others); Warner, B.E.; Havstad, M.A. Lawrence Livermore National Lab., CA (United States). Apr 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950412–20: Spring meeting of the Materials Research Society (MRS), San Francisco, CA (United States), 17-21 Apr 1995). Order Number DE95014165. Source: OSTI; NTIS; INIS; GPO Dep.

Visible light from a copper vapor laser (CVL) operating with 510 and 578 nm radiation (intensity ratio approximately 2:1), an average power of 100 W, a pulse duration of 50 ns, and a repetition frequency of 4.4 kHz has been shown to produce high quality diamond-like-carbon (DLC) films at fluences between $2x10^8$ and $5x10^{10}$ W/cm^2. Maximum deposition rates of 2000 μm·cm^2/h were obtained at $5x10^8$ W/cm^2. DLC films with hardness values of approximately 60 GPa were characterized by a variety of techniques to confirm DLC character, hydrogen content, and surface morphology. The presence of C_2 in the vapor plume was confirmed by the presence of the C_2 Swan bands in emission spectra obtained during the process. Economic implications of process scale-up to industrially meaningful component sizes are presented.

23935 (UCRL-JC–119216) **Magnetic x-ray circular dichroism in nickel-gold multilayers.** Jankowski, A.F. (Lawrence Livermore National Lab., CA (United States)); Tobin, J.G.; Waddill, G.D. Lawrence Livermore National Lab., CA (United States). 11 Nov 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941144–160: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95013459. Source: OSTI; NTIS; GPO Dep.

Magnetic circular dichroism in x-ray absorption is used to investigate the in-plane, remnant magnetization of well-characterized $Ni_{0.48}/Au_{0.52}$ multilayers. Large superlattice strains are found in this multilayer system for samples with a 2nm layer pair spacing. A larger dichroism is found in the Ni 2p absorption edge for a 1.8 nm than for a 4.4 nm layer pair sample. The larger dichroism is consistent with a larger magnitude of in-plane strain for the Ni layers and a larger total magnetic anisotropy energy as previously shown from magnetization curves.

23936 (UCRL-JC–119571) **Molecular dynamics modeling of ultrathin amorphous carbon films.** Glosli, J.N. (Lawrence Livermore National Lab., CA (United States)); Belak, J.; Philpott, M.R. Lawrence Livermore National Lab., CA (United States). May 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9505192–3: 4. international symposium on diamond materials, Reno, NV (United States), 21-26 May 1995). Order Number DE95014454. Source: OSTI; NTIS; GPO Dep.

Amorphous carbon films about 20 mn thick are used by the computer industry as protective coatings on magnetic disks. The structure and function of this family of materials at the atomic level is poorly understood. The growth and properties of a:C and a:CH films 1 to 5 nm thick has been simulated using classical molecular dynamics and a bond-order potential with torsional terms. Studies of quenched melts that verify the ability of this potential to reproduce known features of extended structures of carbon in two and three dimensions are briefly described. In molecular dynamics calculations the incident species were neutral atoms C, or C and H with energies up to 100 eV. The stoichiometry, chemical bonding and distribution functions within the films were analyzed using IBM's Power Visualization System for different incident gas energies. Microscopic features such as multiple ring structures, including planar graphitic structures, were easily identified. Some preliminary studies of the nanotribology of the a:C films are described, including nano-indentation and sliding in contact with a rigid probe.

23937 (UCRL-LR–120950) **Analysis of compressive fracture in rock using statistical techniques.** Blair, S.C. Lawrence Livermore National Lab., CA (United States); California Univ., Berkeley, CA (United States). Dec 1994. 272p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95014694. Source: OSTI; NTIS; GPO Dep.

Fracture of rock in compression is analyzed using a field-theory model, and the processes of crack coalescence and fracture formation and the effect of grain-scale heterogeneities on macroscopic behavior of rock are studied. The model is based on observations of fracture in laboratory compression tests, and incorporates assumptions developed using fracture mechanics analysis of rock fracture. The model represents grains as discrete sites, and uses superposition of continuum and crack-interaction stresses to create cracks at these sites. The sites are also used to introduce local heterogeneity. Clusters of cracked sites can be analyzed using percolation theory. Stress-strain curves for simulated uniaxial tests were analyzed by studying the location of cracked sites, and partitioning of strain energy for selected intervals. Results show that the model implicitly predicts both development of shear-type fracture surfaces and a strength-vs-size relation that are similar to those observed for real rocks. Results of a parameter-sensitivity analysis indicate that heterogeneity in the local stresses, attributed to the shape and loading of individual grains, has a first-order effect on strength, and that increasing local stress heterogeneity lowers compressive strength following an inverse power law. Peak strength decreased with increasing lattice size and decreasing mean site strength, and was independent of site-strength distribution. A model for rock fracture based on a nearest-neighbor algorithm for stress redistribution is also presented and used to simulate laboratory compression tests, with promising results.

23938 (ANL/CHM/CP–85752) **Separation of americium from europium by solvent extraction from aqueous phosphonate media.** Ensor, D.D. (Tennessee Technological Univ., Cookeville, TN (United States). Dept. of Chemistry); Nash, K.L. Argonne National Lab., IL (United States). [1994]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-940301–47: 207. spring national meeting of the American Chemical Society (ACS), San Diego, CA (United States), 13-18 Mar 1994). Order Number DE95012269. Source: OSTI; NTIS; GPO Dep.

Complexes between Am^{3+} or Eu^{3+} and phosphonoacetic acid differ in relative stability in accord with the electrostatic model of cation binding. The smaller Eu^{3+} cation forms stronger complexes with PAA than the larger Am^{3+} cation. The observed metal complexes in the acid range from 0.005 M to 0.02 M (at I= 0.5 M) are $Eu(HL)^{+}$, $Eu(H_2L)_2^{+}$, $Eu(HL)_2^{-}$ and $Am(H_2L)^{2+}$, $Am(HL)^{+}$, $Am(H_2L)_2^{+}$. When used as a holdback reagent, PAA slightly enhances the separation of Am/Eu when used with sulfonic acids or CMPO/nitrate, but reduces separation efficiency with HDEHP. In a $CMPO/SCN^{-}$ extraction system which favors extraction of Am over Eu, addition of PAA increases the separation efficiency by a factor of 2-3 at 0.3 M PAA/0.5 M SCN^{-}. The calculated stability constants can be used to explain the separation factors, but do not always accurately predict metal distribution ratios in the CMPO systems, implying that there are details of this system which have not been fully elucidated.

23939 (ANL/ET/CP–84607) **DSP-based on-line NMR spectroscopy using an anti-Hebbian learning algorithm.** Razazian, K. (Argonne National Lab., IL (United States). Energy Technology Div.); Dieckman, S.L.; Raptis, A.C.; Bobis, J.P. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9507134–1: IEEE Industrial Electronics Society conference, Athens (Greece), 10-14 Jul 1995). Order Number DE95014222. Source: OSTI; NTIS; GPO Dep.

This paper describes a nuclear magnetic resonance (NMR) system that uses an adaptive algorithm to carry out real-time NMR spectroscopy. The system employs a digital signal processor (DSP) chip to regulate the transmitted and received signal together with spectral analysis of the received signal to determine free induction decay (FID). To implement such a signal-processing routine for detection of the desired signal, an adaptive line enhancer filter that uses an anti-Hebbian learning algorithm is applied to the FID spectra. The results indicate that the adaptive filter can be a reliable technique for on-line spectroscopy study.

23940 (CIEMAT–760) **Analysis of sample composition using resonant ionization and time-of-flight techniques.** Luz, A. de la; Ortiz, M.; Campos, J. No corporate text available. 1995. 200p. (In Spanish). Order Number DE95780847. Source: OSTI; NTIS; INIS.

This paper describes the setting up of a linear time-of-flight mass spectrometer that uses a tunable laser to produce resonant ionization of atoms and molecules in a pulsed supersonic beam. The ability of this kind of systems to produce time resolved signals for each species present in the samples allows quantitative analysis of its composition. By using a tunable laser beam of high spectral resolution to produce ionization, studies based on the structure of the photoionization spectra obtained are possible. In the present work several isotopic species of ordinary and deuterated benzene have been studies. special care has been dedicated to the influence of the presence of a "13 C in the ring. In this way values for spectroscopic constants and isotopic shifts have been obtained. Another system based in a homemade proportional counter has been designed and used as an auxiliary system. The results obtained with it are independent of these mentioned above and compatible with them. This system is of great utility for laser wavelength tuning to produce ionization in the mass spectrometer.

23941 (CONF-9505101–1) **Batch test equilibration studies examining the removal of Cs, Sr, and Tc from supernatants from ORNL underground storage tanks by selected ion exchangers.** Collins, J.L.; Egan, B.Z.; Anderson, K.K.; Chase, C.W.; Bell, J.T. Oak Ridge National Lab., TN (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Conference on challenges and innovations in the management of hazardous waste; Washington, DC (United States); 10-12 May 1995. Order Number DE95013204. Source: OSTI; NTIS; INIS; GPO Dep.

Bench-scale batch equilibration tests have been conducted with supernatants from two underground tanks at the Melton Valley Storage Tank (MVST) Facility at Oak Ridge National Laboratory (ORNL) to determine the effectiveness of selected ion exchangers in removing cesium, strontium, and technetium. Seven sorbents were evaluated for cesium removal, nine for strontium removal, and four for technetium removal. The results indicate that granular potassium cobalt hexacyanoferrate was the most effective of the exchangers evaluated for removing cesium from the supernatants. The powdered forms of sodium titanate (NaTiO) and crystalline silicotitanate (CST) were superior in removing the strontium; however, for the sorbents of suitable particle size for column use, titanium monohydrogen phosphate (TiHP ϕ), sodium titanate/polyacrylonitrile (NaTiO-PAN), and titanium monohydrogen phosphate/polyacrylonitrile (TiP-PAN) gave the best results and were about equally effective. Reillex™ 402 was the most effective exchanger in removing the technetium; however, it was only slightly more satisfactory than Reillex™ HPQ.

23942 (CONF-950853–3) **Numerical predictions of the separation of heavy components inside the trace gas concentrator.** Mo, J.D. (Univ. of Memphis, TN (United States). Mechanical Engineering Dept.); Szady, A.J. Oak Ridge National Lab., TN (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Subcontract SR301-85-RC. From ASME/JSME annual summer meeting of the Fluids Engineering conference; Hilton Head, SC (United States);

13-17 Aug 1995. Order Number DE95013039. Source: OSTI; NTIS; INIS; GPO Dep.

The component with a heavier molecular weight can be separated from the one with a lighter molecular weight in a binary mixture by applying an appropriate pressure gradient. A centrifugal force field effectively generates the required pressure gradient and a favorable flow field along the radial direction in a trace gas concentrator for such an application. This paper presents the numerical predictions of the mass separation inside a trace gas concentrator, which enriches Xenon in air. A Navier-Stokes solver in primitive variables using a pressure based algorithm has been applied to solve for the flow fields. Subsequently, the transport equations with a strong centrifugal field are solved for the mass concentration. This study is the continued effort for the proof-of-concept of centrifugal separation of components with a considerable difference in their molecular weight in a binary mixture. The significant effects of rotational speed, flow field, and the geometrical configuration on the mass separation are presented in this paper.

23943 (DOE/ER/14315–T2) **The hydrophobic character of nonsulfide mineral surfaces as influenced by double-bond reactions of adsorbed unsaturated collector species. Progress report, 15 December 1992–14 December 1995.** Miller, J.D. Utah Univ., Salt Lake City, UT (United States). Dept. of Metallurgical Engineering. Jun 1995. 273p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-93ER14315. Order Number DE95015116. Source: OSTI; NTIS; GPO Dep.

Goal is to provide a basis for improved flotation separation efficiency in nonsulfide minerals by establishing the collector (surfactant) adsorption reactions and developing appropriate surface chemistry control strategies. In-situ measurements of surfactant adsorption were made for selected nonsulfide mineral systems using FT-IR/IRS with reactive internal reflection elements. The IRS adsorption density equation was developed to measure the surfactant adsorption, and its validity was confirmed using transferred Langmuir-Blodgett films. Order and organization of adsorbed surfactants were established from linear dichroism spectroscopy. Hydrophobicity and stability of adsorbed surfactants at mineral surfaces can now be explained. The surface charge/collector colloid adsorption mechanism was used to explain the anomalous behavior of KCl and flotation of double salts (schoenite, kainite, borax, etc.) from saturated brines. Adsorbing surfactnat colloids at salt surfaces in brines were studied by photon correlation spectroscopy and atomic force microscopy. Studies are being initiated of the interparticle forces in soluble salt flotation and of interfacial water near hydrophilic and hydrophobic surfaces.

23944 (DOE/MC/30024–95/C0495) **Applicability of atomic fluorescence and atomic absorption spectroscopy for on-line analysis of mercury in coal combustion and gasification effluents.** Norton, G.A.; Eckels, D.E. Ames Lab., IA (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. (CONF-950839–1: Conference on particulate control/managing hazardous air pollutants, Toronto (Canada), 15-18 Aug 1995). Order Number DE95014986. Source: OSTI; NTIS; GPO Dep.

With the passage of the Clean Air Act Amendments of 1990, the on-line monitoring of mercury in effluents from coal combustors and gasifiers is receiving considerable interest. In this study, the applicability of using atomic fluorescence and atomic absorption techniques for on-line monitoring applications is discussed. Laboratory data obtained with two sensitive commercial mercury detectors (one fluorescence and one absorption unit) are presented to demonstrate general instrumental and analytical capabilities. Differences in instrument sensitivity, detection limits, dynamic range, quenching effects, and interferences are discussed.

This issue is the collection of the papers presented at the title conference. The 31 of the presented papers are indexed individually. (J.P.N.).

23946 (LA-SUB–94-161) **Application to transfer radioactive waste to the Nevada Test Site.** Los Alamos National Lab., NM (United States); Gutierrez-Palmenberg, Inc. (United States). 1 Jun 1992. 101p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95011841. Source: OSTI; NTIS; INIS; GPO Dep.

All waste described in this application has been, and will be, generated by LANL in support of the nuclear weapons test program at the NTS. All waste originates on the NTS. DOE Order 5820.2A states that low-level radioactive waste shall be disposed of at the site where it is generated, when practical. Since the waste is produced at the NTS, it is cost effective for LANL to dispose of the waste at the NTS.

23947 (UCRL-JC–119349) **Pyrochemical processing of Idaho Chemical Processing Plant (ICPP) High Level Waste (HLW) calcine.** Bronson, M.C. (Lawrence Livermore National Lab., CA (United States)); Ebbinghaus, B.B.; Riley, D.C.; Nelson, L.; Del Debbio, J. Lawrence Livermore National Lab., CA (United States). 15 Nov 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9502108–1: 1995 annual Metallurgical Society meeting, Las Vegas, NV (United States), 12-16 Feb 1995). Order Number DE95014516. Source: OSTI; NTIS; INIS; GPO Dep.

Inertial force damping control by micromanipulator modulation is proposed to suppress the vibrations of a micro/macro-manipulator system. The proposed controller, developed using classical control theory, is added to the existing control system. The proposed controller uses real-time measurements of macro-manipulator flexibility to adjust the motion of the micro manipulator to counteract structural vibrations. Experimental studies using an existing micro/macro flexible link manipulator testbed demonstrate the effectiveness of the proposed approach to suppression of vibrations in the macro/micro-manipulator system using micromanipulator-based inertial active damping control.

23948 (UCRL-JC–119739) **Photolytic destruction of oxalate in aqueous mixed waste.** Wang, F.T.; Lum, B.Y. Lawrence Livermore National Lab., CA (United States). Mar 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950877–12: 3. American Society for Mechanical Engineers biannual mixed waste symposium, Baltimore, MD (United States), 7-11 Aug 1995). Order Number DE95014133. Source: OSTI; NTIS; INIS; GPO Dep.

In aqueous plutonium processing, residual oxalic acid can be destroyed (oxalate kill) by UV light with hydrogen peroxide (H_2O_2) in 1 M HCl solutions. By controlling the amount of H_2O_2, the oxalate kill process will not affect the chloride concentration. In nitric acid solutions, UV light alone can destroy the oxalic acid. However, with H_2O_2, the rate of destruction is faster. After the destruction of oxalic acid, the acidic solutions may be reusable without further purification process.

23949 (UCRL-JC–119844) **The use of capacitive deionization with carbon aerogel electrodes to remove inorganic contaminants from water.** Farmer, J.C.; Fix, D.V.; Mack, G.V.; Pekala, R.W.; Poco, J.F. Lawrence Livermore National Lab., CA (United States). 17 Feb 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950718–1: Electric Power Research Institute low-level waste conference, Orlando, FL (United States), 10-12 Jul 1995). Order Number DE95013455. Source: OSTI; NTIS; INIS; GPO Dep.

The capacitive deionization of water with a stack of carbon aerogel electrodes has been successfully demonstrated for the first time. Unlike ion exchange, one of the more conventional deionization processes, no chemicals were required for regeneration of the system. Electricity was used instead. Water with various anions and cations was pumped through the electrochemical cell. After polarization, ions were electrostatically removed from the water and

held in the electric double layers formed at electrode surfaces. The water leaving the cell was purified, as desired.

23950 (ANL/CMT/CP–84826) **A theory for correlating the thermodynamic and structural properties of molten silicate solutions.** Blander, M.; Bloom, I. Argonne National Lab., IL (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950265–2: Harold A. Oeye international symposium, Trondheim (Norway), 2-3 Feb 1995). Order Number DE95012946. Source: OSTI; NTIS; GPO Dep.

A theory of molten silicates is presented which takes into account the dependence of the free energy of cutting Si-O-Si bridging bonds on local structures of the two silicons in the bond. Resultant equations describe the thermodynamic properties of primary silicate solutions containing a mixture of bridges and cut bridges, and should ultimately provide a realistic measure of the distribution of silicon species which have i cut bridges (i = 1,2,3,4) from analyses of thermodynamic data.

23951 (BNL–61802) **Surface crystallization in normal-alkanes and alcohols.** Deutsch, M. (Bar Ilan Univ., Ramat-Gan (Israel). Physics Dept.); Ocko, B.M.; Wu, X.Z.; Sirota, E.B.; Sinha, S.K. Brookhaven National Lab., Upton, NY (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950183–3: Recontres de Moriond workshop, Villar-sur-Ollon (Switzerland), 21-28 Jan 1995). Order Number DE95013312. Source: OSTI; NTIS; GPO Dep.

A new, rare surface freezing, phenomenon is observed in molten normal-alkanes and their derivatives (alcohols, thiols, etc.). X-ray and surface tension measurements show the formation of a crystalline monolayer on the surface of the liquid alkane at temperatures up to 3 C above the bulk solidification temperature, T_f. For alcohols, a single bilayer is formed. In both cases, the molecules in the layer are hexagonally packed and oriented normal to the surface for short chain lengths, and tilted for long ones. In both cases the single layer persists down to T_f. In terms of wetting theory, this constitutes a very limited partial wetting of the liquid surface by the crystalline layer. The new surface phase is obtained only for chain lengths $14 < n \leq 50$ in alkanes, and $16 < n < 30$ in alcohols. The measurements are satisfactorily accounted for within a simple theory based on surface energy considerations.

23952 (DOE/CE/23810–46) **Measurement of viscosity, density, and gas solubility of refrigerant blends in selected synthetic lubricants. Final report.** Cavestri, R.C. (Imagination Resources, Inc., Dublin, OH (United States)). Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States). 15 May 1995. 195p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. Order Number DE95013301. Source: OSTI; NTIS; GPO Dep.

The lubricants tested in this project were chosen based on the results of liquid/liquid miscibility tests. EMKARATE RL32S and Emery 2968A were selected. The Vapor Liquid Equilibrium (VLE) viscosity reduction and gas fractionation of each was measured with three different refrigerant blends: (1) R-404A; (2) R-507; and (3) R-407C. In addition, the four single refrigerants that make up the blends, HFC-32, HFC-125, HFC-134a, and HFC-143a, were also measured. Lubricants found to have the lowest liquid/liquid miscibilities had nearly equal viscosity reduction profiles as did the more miscible lubricants. Analytical methodology consisted of maintaining equally both the composition of the head space vapor above the lubricant/refrigerant mixture, and the composition of the liquid blend refrigerant. Blends with large temperature glides were re-evaluated in order to test the concept of head space quality and a vented piston hydraulic cylinder assembly was developed to perform this task. Fluid property data, above critical temperature and pressure conditions, is presented for the two lubricants with HFC-32, HFC-125, HFC-143a refrigerants. This research shows that the lubricant EMKARATE RL32S, which had the lowest (poorest) liquid/liquid miscibilities with the selected refrigerants, also had nearly equal viscosity reduction profiles to the more miscible Emery 2968A lubricant. The analytical methodology consisted of maintaining the composition of the refrigerant gas above the lubricant to be equal in composition to that of the pure liquid refrigerant blend being introduced into the lubricant. Refrigerant blends with large temperature glides were re-evaluated in order to validate the concept of the importance of the composition of the gas over the lubricant. To do perform this task, a special vented piston hydraulic cylinder assembly was developed. Fluid property data is also presented for HFC-32, HFC-125, and HFC-143a above the critical temperature and pressure of each.

23953 (DOE/ER/13439–T5) **Infrared absorption spectroscopy and chemical kinetics of free radicals. Final performance report, August 1, 1985–July 31, 1994.** Curl, R.F.; Glass, G.P. Rice Univ., Houston, TX (United States). Dept. of Chemistry. [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-85ER13439. Order Number DE95013504. Source: OSTI; NTIS; GPO Dep.

This research was directed at the detection, monitoring, and study (by infrared absorption spectroscopy) of the chemical kinetic behavior of small free radical species thought to be important intermediates in combustion. The work typically progressed from the detection and analysis of the infrared spectrum of combustion radical to the utilization of the infrared spectrum thus obtained in the investigation of chemical kinetics of the radical species. The methodology employed was infrared kinetic spectroscopy. In this technique the radical is produced by UV flash photolysis using an excimer laser and then its transient infrared absorption is observed using a single frequency cw laser as the source of the infrared probe light. When the probe laser frequency is near the center of an absorption line of the radical produced by the flash, the transient infrared absorption rises rapidly and then decays as the radical reacts with the precursor or with substances introduced for the purpose of studying the reaction kinetics or with itself. The decay times observed in these studies varied from less than one microsecond to more than one millisecond. By choosing appropriate time windows after the flash and the average infrared detector signal in a window as data channels, the infrared spectrum of the radical may be obtained. By locking the infrared probe laser to the center of the absorption line and measuring the rate of decay of the transient infrared absorption signal as the chemical composition of the gas mixture is varied, the chemical kinetics of the radical may be investigated. In what follows the systems investigated and the results obtained are outlined.

23954 (DOE/ER/13442–9) **Energy transfer properties and mechanisms. Technical progress report.** Barker, J.R. Michigan Univ., Ann Arbor, MI (United States). Dept. of Atmospheric, Oceanic and Space Sciences. 3 Feb 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER13442. Order Number DE95013818. Source: OSTI; NTIS; INIS; GPO Dep.

Collisional energy transfer is the controlling factor in many nonequilibrium chemical systems: combustion, laser-induced chemical reactions, shock-heated gases, atmospheric chemistry, etc. During this period, efforts were made in 3 areas: large molecule energy transfer experiments (organic compounds); triatomic V-T/R energy transfer (memory effects); and energy transfer in extreme environments (shock tube data on norbornene). Results are described very briefly.

23955 (DOE/ER/13460–2) **Energies of organic compounds. Technical progress report.** Wiberg, K.B. Yale Univ., New Haven, CT (United States). Dept. of Chemistry. 12 Aug 1987. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER13460. Order Number DE95014702. Source: OSTI; NTIS; GPO Dep.

A procedure was developed for carbonyl group reduction using triethylborohydride. Esters and lactones are readily reduced and are suitable as substrates. Some enthalpies of hydrolysis of lactones and esters were measured. Heats of trifluoroacetolysis of alkenes leading to tertiary alcohols were measured; some cyclic systems were also investigated. In order to study the effect of α-alkyl substituents on ketones, rotational barriers adjacent to carbonyl groups were studied.

23956 (DOE/ER/13460–T3) **Energies of organic compounds. Final report.** Yale Univ., New Haven, CT (United States). Dept. of Chemistry. [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER13460. Order Number DE95014547. Source: OSTI; NTIS; GPO Dep.

The objective of this research was to gain information on the energies of organic compounds and on the factors that control energies. The work involved calorimetric measurements of energy changes and theoretical studies of intramolecular interactions and molecular energies.

23957 (DOE/PC/91030–T9) **Methyl chloride via oxyhydrochlorination of methane. Quarterly technical progress report No. 8, July–September 1993.** Dow Corning Corp., Carrollton, KY (United States). Jan 1994. 82p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91030. Order Number DE95014338. Source: OSTI; NTIS; GPO Dep.

Significant progress was made in four different technical areas during this quarter. These key highlights are: In the catalyst definition work, it was found that there seems to be a definite correlation between active catalysts and catalyst crystallinity as shown by peaks in the XRD patterns. This could be indicative of the active site of oxyhydrochlorination on the catalyst; in the separation unit operation definition the feasibility of the chosen technology was established. Using a laboratory absorber column attached directly to an OHC screening reactor, very high removal percentages for CH_3Cl were shown; a final scope for the PDU was determined. The finalization of the scope definition work allowed the completion of a project design package which was used to refine the estimates of the work to be done during detail engineering; and groundbreaking for the PDU occurred. Site preparation work began. Demolition work was completed where existing equipment and piping was removed from a defunct pilot plant. Some minor paving work was also completed during this period at the site.

23958 (DOE/PC/91030–T10) **Methyl chloride via oxyhydrochlorination of methane. Quarterly technical progress report No. 10, January 1944–March 1994.** Dow Corning Corp., Carrollton, KY (United States). Aug 1994. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91030. Order Number DE95014337. Source: OSTI; NTIS; GPO Dep.

In work related to the design and construction of the Process Development Unit (PDU) this quarter involved further detail design and a real start to the construction activities. Status updates are given below for each discipline in the Task 2.0 and 3.0 headings. This work is progressing well. with the caveat of several small slips in the scheduling. On the catalyst development front this quarter was extremely productive. Many catalyst screening experiments were completed and they showed that control of the reaction exotherm is going to be quite challenging under PDU conditions. The presence of much more efficient reactor design and the ability to maintain closer to isothermal conditions is expected to give a significant advantage in actual PDU operation. A major concern at the moment is the cost of La in the catalyst being used. An action plan to remedy this is being put together.

23959 (DOE/PC/91030–T11) **Methyl chloride via oxyhydrochlorination of methane. Quarterly technical progress report No. 11, April–June 1994.** Dow Corning Corp., Carrollton, KY (United States). Nov 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91030. Order Number DE95014336. Source: OSTI; NTIS; GPO Dep.

The purpose of this contract is to develop a process for converting light alkane gases to methyl chloride via oxyhydrochlorination using highly selective, stable catalysts in fixed-bed reactors designed to remove the large amount of heat generated, so as to control the reaction temperature. Further, the objective is to obtain the engineering data base necessary for developing a commercially feasible process and to evaluate the economics of the process. Significant progress was made in catalyst and PDU development this quarter. The key points of these developments are: Initial discussions have taken place with a catalyst supplier. United Catalysts, Inc. UCI came up with some good catalyst development suggestions and has agreed to produce a batch of catalyst for the PDU; previous plans for supply of methane for the PDU have fallen through. New options. including getting gas from Carrollton Utilities, are being evaluated; and PDU equipment installation is completed. and piping is 40% complete. The electrical work is close to being finished, and the instrumentation is underway.

23960 (DOE/PC/91030–T12) **Methyl chloride via oxyhydrochlorination of methane. Quarterly technical progress report No. 12, July–September 1994.** Dow Corning Corp., Carrollton, KY (United States). Nov 1994. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91030. Order Number DE95014335. Source: OSTI; NTIS; GPO Dep.

Significant progress was made in six different technical areas during this quarter. These key highlights are: (1) Mixed $LnCl_3$ solutions were successfully tested as substitutes for $LaCl_3$ in preparing OHC catalysts. This will dramatically lower the price of the catalyst. (2) Six catalyst samples were received from UCI. Each was made via either incipient wetness or compounded extrudate techniques. Four of the catalysts have been screened. All seem adequate. (3) Contact has opened with Calsicat as an alternate catalyst supplier to UCI. It should be valuable to draw from their catalyst expertise. (4) It has been decided to tie into the plant's natural gas source. Methods of cleaning up this stream are being investigated. (5) PDU construction completion is expected the first week in November. Pressure testing and punchout fix-up work remain to be completed. (6) Three new engineers were hired to work on the PDU. Half of the temporary operating procedures (TOP's) have been written. SOP completion date is targeted for the beginning of November.

23961 (LA-UR–95-1304) **A diethyl phosphonate containing oxazoline: Synthesis and characterization of monomer and homopolymer.** Hermes, R.E.; Thompson, R.D.; Valdez, L.S. Los Alamos National Lab., NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950801–1: 210. national meeting of the American Chemical Society, Chicago, IL (United States), 20-25 Aug 1995). Order Number DE95012074. Source: OSTI; NTIS; GPO Dep.

A diethyl phosphonate oxazoline monomer and its polymer have been synthesized. The monomer appears to polymerize via a ring-opening mechanism giving the expected polyethyleneimine backbone with pendant carbonyl groups. Two distinct molecular weights were produced during polymerization suggesting two mechanisms of chain growth. Studies are underway to elucidate the reasons for this. This polymer has potential as a metal-chelating agent.

23962 (LBL–36465) **Quantum theory of chemical reaction rates.** Miller, W.H. (Univ. of California, Berkeley, CA (United States). Dept. of Chemistry). Lawrence Berkeley Lab., CA (United States). Oct 1994. 11p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract AC03-76SF00098. Grant CHE-8920690. (CONF-9410349–2: 38. conference on chemical research, chemical dynamics of transient species, Houston, TX (United States), 24-25 Oct 1994). Order Number DE95014770. Source: OSTI; NTIS; GPO Dep.

If one wishes to describe a chemical reaction at the most detailed level possible, i.e., its state-to-state differential scattering cross section, then it is necessary to solve the Schroedinger equation to obtain the S-matrix as a function of total energy E and total angular momentum J, in terms of which the cross sections can be calculated as given by equation (1) in the paper. All other physically observable attributes of the reaction can be derived from the cross sections. Often, in fact, one is primarily interested in the least detailed quantity which characterizes the reaction, namely its thermal rate constant, which is obtained by integrating Eq. (1) over all scattering angles, summing over all product quantum states, and

Boltzmann-averaging over all initial quantum states of reactants. With the proper weighting factors, all of these averages are conveniently contained in the cumulative reaction probability (CRP), which is defined by equation (2) and in terms of which the thermal rate constant is given by equation (3). Thus, having carried out a full state-to-state scattering calculation to obtain the S-matrix, one can obtain the CRP from Eq. (2), and then rate constant from Eq. (3), but this seems like "overkill"; i.e., if one only wants the rate constant, it would clearly be desirable to have a theory that allows one to calculate it, or the CRP, more directly than via Eq. (2), yet also correctly, i.e., without inherent approximations. Such a theory is the subject of this paper.

23963 (LBL–37170) **Dynamics of inelastic and reactive gas-surface collisions.** Smoliar, L.A. Lawrence Berkeley Lab., CA (United States). Apr 1995. 143p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95014799. Source: OSTI; NTIS; GPO Dep.

The dynamics of inelastic and reactive collisions in atomic beam-surface scattering are presented. The inelastic scattering of hyperthermal rare gaseous atoms from three alkali halide surfaces (LiF, NaCl, GI)was studied to understand mechanical energy transfer in unreactive systems. The dynamics of the chemical reaction in the scattering of H(D) atoms from the surfaces of LIF(001) and the basal plane of graphite were also studied.

23964 (PNL-SA–24794) **Structure sensitive selectivity of the NO-CO reaction over rhodium single crystal catalysts.** Peden, C.H.F. (Pacific Northwest Lab., Richland, WA (United States)); Belton, D.N.; Schmieg, S.J. Pacific Northwest Lab., Richland, WA (United States). May 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950561–1: 1. world conference on environmental catalysis for a better world and life: 529th event of the European Federation of Chemical Engineering, Pisa (Italy), 1-5 May 1995). Order Number DE95014627. Source: OSTI; NTIS; GPO Dep.

The control of automotive emissions of nitrogen oxides (NO_x) in passenger cars is accomplished by a heavy reliance on after-treatment of the engine exhaust using catalytic converters that contain a mixture of platinum (Pt), rhodium (Rh), and sometimes palladium (Pd). In this paper we examine the effect of surface structure on the NO-CO activity and selectivity by comparing the reactivity of Rh(110) and Rh(111) single crystal catalysts. Selectivity for the two possible nitrogen containing products from NO reduction, N_2O and N_2, is particularly interesting. Here we report that the selectivity of the NO-CO reaction is quite sensitive to the structure of the Rh catalyst metal surface. (A more complete description of these studies will be published elsewhere.) The more open Rh(110) surface tends to make significantly less N_2O than Rh(111) under virtually all conditions that we probed with these experiments. Furthermore, under the conditions used in this study, the NO-CO activity over Rh(110), as measured by the rate of NO loss, is somewhat faster than over Rh(111) with a lower apparent activation energy (Ea), 27.6 vs. 35.4 kcal/mol. We attribute these results to the greater tendency of the more open (110) surface to dissociate NO. Notably, more facile NO dissociation on Rh(110) would lead to greater steady-state concentrations of adsorbed N-atoms; thus, the (110) surface favors N-atom recombination over the surface reaction between adsorbed NO and N-atoms to make N_2O. In support of this, post-reaction surface analysis shows only NO on the Rh(111) surface while the Rh(110) surface contains predominantly N-atoms and much lower concentrations of adsorbed NO. NO dissociation on Rh(110) is more favorable than on Rh(111), in part, because it is less-severely poisoned by high surface concentrations of NO. In addition, the more-open (110) surface may be intrinsically more active for the elementary process of dissociating adsorbed NO.

23965 (SAND–95-0388) **Fullerene-based materials research and development. LDRD final report.** Cahill, P.A.; Henderson, C.C.; Rohlfing, C.M.; Loy, D.A.; Assink, R.A.; Gillen, K.T.; Jacobs, S.J.; Dugger, M.T. Sandia National Labs., Albuquerque, NM (United States). May 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95012522. Source: OSTI; NTIS; GPO Dep.

The chemistry and physical properties of fullerenes, the third, molecular allotrope of carbon, have been studied using both experimental and computational techniques. Early computational work investigated the stability of fullerene isomers and oxides, which was followed by extensive work on hydrogenated fullerenes. Our work led to the first synthesis of a polymer containing C_{60} and the synthesis of the simplest hydrocarbon derivatives of C_{60} and C_{70}. The excellent agreement between theory and experiment ($\pm$ 0.1 kcal/mol in the relative stability of isomers) has provided insight into the chemical nature of fullerenes and has yielded a sound basis for prediction of the structure of derivatized fullerenes. Such derivatives are the key to the preparation of fullerene-based materials.

23966 (SAND–95-1063) **Multicomponent three-phase equilibria.** Ho, C.K. Sandia National Labs., Albuquerque, NM (United States). Jun 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95014491. Source: OSTI; NTIS; GPO Dep.

This paper presents the relations that describe thermodynamic equilibrium in a three-phase system. Multiple components, including air, water, and oil components, are considered in three phases: (1) aqueous, (2) oil, and (3) gas. Primary variables are specified for each of seven possible phase combinations. These primary variables are then used to determine the necessary secondary variables to completely describe the system. Criteria are also developed to check the stability of each phase configuration and determine possible transitions from one phase configuration to another phase configuration via phase appearances and disappearances.

23967 (SAND–95-8569) **Gas-phase chemistry during the conversion of cyclohexane to carbon: Flow reactor studies at low and intermediate pressure.** Osterheld, T.H.; Allendorf, M.D.; Larson, R. Sandia National Labs., Livermore, CA (United States). Jul 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95015377. Source: OSTI; NTIS; GPO Dep.

The gas-phase branching during the conversion of cyclohexane to solid carbon has been measured in a high-temperature-flow reactor. The experiments show that cyclohexane decomposes into a broad distribution of hydrocarbons that further decompose into the more kinetically stable products hydrogen, methane, acetylene, ethylene, benzene, and PAH. At 1363 K, the evolution to these species occurs quickly. We also observe the buildup of significant amounts of aromatic molecules at later stages in the decomposition, with as much as 15% of the total carbon in PAH and 25% in benzene. At later stages, the gas-phase molecules react slowly, even though the system is not at equilibrium, because of their kinetic stability and the smaller radical pool. The decomposition does not appear to depend sensitively on pressure in the regime of 25 to 250 torr. Thus, to a first approximation, these results can be extrapolated to atmospheric pressure.

23968 (UCRL-ID–118655) **Hydrogen chemisorption on diamond surfaces. Final report.** Daley, R.; Musket, R. Lawrence Livermore National Lab., CA (United States). Sep 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015844. Source: OSTI; NTIS; GPO Dep.

Previously we demonstrated the ability to measure submonolayer quantities of surface hydrogen on insulating glasses. The present study builds on this by examining hydrogen coverages on another insulating material: the technologically important diamond (100) surface. The information to be obtained in the present study will allow us to deduce the correct structures for the diamond (100)-(1X1) and -(2X1) surface phases and provide information on the kinetics of hydrogen desorption from the (100) surface. Such experiments are essential for a complete understanding of hydrogen surface chemistry during the chemical vapor deposition of thin diamond films. This report summarizes progress made in FY93 for measuring surface hydrogen concentrations on the diamond (100) surface. Although the available LDRD resources were insufficient to finish this study in FY93, completion of the study is planned using other resources and this detailed report as a reference.

4004 Electrochemistry

23969 (UCRL-ID–119263) **Capacitive deionization of water: An innovative new process.** Farmer, J. (and others); Fix, D.; Mack, G. Lawrence Livermore National Lab., CA (United States). 9 Jan 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950917–12: 5. international conference on radioactive waste management and environmental remediation, Berlin (Germany), 3-9 Sep 1995). Order Number DE95015848. Source: OSTI; NTIS; GPO Dep.

The capacitive deionization of water with a stack of carbon aerogel electrodes has been successfully demonstrated for the first time. Unlike ion exchange, one of the more conventional deionization processes, no chemicals were required for regeneration of the system. Electricity was used instead. Water with various anions and cations was pumped through the electrochemical cell. After polarization, ions were electrostatically removed from the water and held in the electric double layers formed at electrode surfaces. The water leaving the cell was purified, as desired.

4005 Photochemistry

23970 (ANL/CHM/CP–86825) **Structure-function relationships of second hyperpolarizabilities in two-dimensional molecules.** Chen, L.X. (Argonne National Lab., IL (United States)); Mandal, B.K.; Bihari, B. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950793–3: 40. annual meeting of the Society of Photo-Optical Instrumentation Engineers: international symposium on optical science, engineering and instrumentation, San Diego, CA (United States), 9-14 Jul 1995). Order Number DE95014233. Source: OSTI; NTIS; GPO Dep.

The enhancement of the third order susceptibilities $X^{(3)}$ and second order molecular hyperpolarizabilities $<\gamma>$ in a series of covalently stacked dimer and trimer macrocycles (SiPc and SiNc) was observed through the phase conjugated signals from DFWM measurements at both 1064 and 532 nm. The FWHM of the phase conjugated signals at 532 nm is much smaller than those at 1064 nm and those of the reference compound CS_2. The $<\gamma>$ values at both wavelengths as a function of number of the monomer units (n) have an approximate n^3 dependence, differing only in the scaling constant. The origin of such enhancement is discussed and compared to those in one-dimensional π-conjugated systems.

4006 Radiation Chemistry

23971 (ANL/CHM/CP–85693) **Excess charges in semiconductor nanocrystallites.** Laungdilok, C. (Argonne National Lab., IL (United States). Chemistry Div.); Lawless, D.; Cook, A.R.; Meisel, D. Argonne National Lab., IL (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9505228–1: 48. Society for Imaging Science and Technology (IS&T) annual conference, Washington, DC (United States), 7-12 May 1995). Order Number DE95013404. Source: OSTI; NTIS; INIS; GPO Dep.

The authors explore in this report the effects of excess electrons on the edge of the absorption spectrum of small semiconductor particles. The presence of these charges leads to strong bleaching of the absorption at the exciton region and to slight enhancement of the absorption on both sides of the bleaching. They show that the effect is independent of the origin of the charge; it occurs whether the charge is injected into the particle or only attached to its surface, and it appears even when the charge is deeply localized within the band gap. They conclude that the effect arises from the electric field associated with the charge and not from its presence in the band.

23972 (IAERU–9304, pp. 239-244) **A comment on the future studies on classical hot atom chemistry.** Matsuura, Tatsuo (Rikkyo Univ., Yokosuka, Kanagawa (Japan). Inst. for Atomic Energy). Rikkyo Univ., Yokosuka, Kanagawa (Japan). Inst. for Atomic Energy. Dec 1993. (CONF-9210482–: International seminar on the chemistry of high energy atoms, Tokyo (Japan), 28-30 Oct 1992). In *Proceedings of the international seminar on the chemistry of high energy atoms.* 270p. Order Number DE95709895. Source: OSTI; NTIS; INIS.

Classical hot atom chemistry can still provide useful information on fundamental aspects such as the intermolecular and intramolecular energy transfer processes. Here, we propose some ideas concerning the retention to be studied both from the experimental and theoretical points of view in the framework of classical hot atom chemistry. (author).

23973 (SAND–95-8497C) **A conservative Low Mach number projection method for reacting flow modelling.** Najm, H.N. Sandia National Labs., Livermore, CA (United States). [1995]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950731–1: 8. international symposium on transport phenomena in combustion, San Francisco, CA (United States), 16-20 Jul 1995). Order Number DE95010754. Source: OSTI; NTIS; GPO Dep.

A conservative Low Mach number predictor-corrector projection scheme is developed, and implemented on reacting flow in a closed domain. The stagnation pressure is computed with an integral constraint that allows a conservative update of the density field using the non-conservative energy equation and the continuity equation. A premixed flame-vortex interaction is studied to examine the mutual effects of unsteady flow and reaction at the flame front. Second order convergence is demonstrated. Flame statistics axe reported and compared to available data. A super-adiabatic condition is observed behind the flame due to the pressure rise in the domain. The implications for flame response to the flow field are studied, revealing significant deviation from one-dimensional stagnation flame behaviour. Time history effects related to pressure rise are found to have a significant role in determining the flame peak reaction rate response to flow induced stretch.

23974 (SAND–95-8531) **Sandia Combustion Research: Technical review.** Sandia National Labs., Livermore, CA (United States). 1995. 121p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95014027. Source: OSTI; NTIS; GPO Dep.

This report contains reports from research programs conducted at the Sandia Combustion Research Facility. Research is presented under the following topics: laser based diagnostics; combustion chemistry; reacting flow; combustion in engines and commercial burners; coal combustion; and industrial processing. Individual projects were processed separately for entry onto the DOE databases.

23975 (ANL/ET/CP–82671) **Remote disassembly of irradiated tritium-bearing lithium-bonded capsules.** Tsai, H. (Argonne National Lab., IL (United States). Energy Technology Div.); Strain,

R.V.; Donahue, D.A.; Savoie, F.E.; Evans, D.A.; Neimark, L.A. Argonne National Lab., IL (United States). Sep 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950232–37: 6. American Nuclear Society meeting on robotics and remote systems, Monterey, CA (United States), 5-10 Feb 1995). Order Number DE95013687. Source: OSTI; NTIS; INIS; GPO Dep.

Seven irradiated tritium-bearing lithium-bonded capsules containing vanadium alloy specimens were disassembled in a hot-cell facility at Argonne National Laboratory. These capsules were irradiated in the Fast Flux Test Facility as part of the structural materials research for the Fusion Power Program. The principal concern in disassembling these capsules to retrieve the test specimens was the hazard associated with the residual bonded tritium, which ranged from ~17 to 99 Ci per capsule. This tritium had to be contained to the maximum extent possible. An enclosed system was built in which the authors used liquid ammonia to dissolve the lithium bond, alcohol to rinse and clean the retrieved specimens, and chemical getters (containing a reactive metal alloy) to trap the released tritium gas. The main processing units of the system are inside a hot cell and the remainder are in a vented cabinet. Essentially all of the tritium in the capsules was either trapped in the getters or confined in the solid reaction residues in beakers of spent ammonia and alcohol. There was no personnel contamination or accidental tritium release during the entire procedure.

23976 (BNL–52454) **Dynamic response of a pair of walls retaining a viscoelastic solid.** Veletsos, A.S.; Parikh, V.H.; Younan, A.H.; Bandyopadhyay, K. Brookhaven National Lab., Upton, NY (United States). Jan 1995. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95012092. Source: OSTI; NTIS; GPO Dep.

Making use of a previously reported, simple, approximate method of analysis, a critical evaluation is made of the dynamic pressures and forces induced by horizontal ground shaking on a pair of infinitely long, parallel walls retaining a uniform viscoelastic solid. The walls are presumed to be rigid but elastically constrained against rotation at their base. The effects of both harmonic and earthquake-induced excitations are examined. The accuracy of the method is assessed by comparing its predictions for the special case of fixed-based walls with those obtained by an exact method, and comprehensive numerical data are presented which elucidate the underlying response mechanisms, and the effects and relative importance of the parameters involved. The parameters examined include the characteristics of the ground motion, the ratio of the distance between walls to the height of the contained material, and the flexibility of the rotational wall constraints. In addition to valuable insights into the responses of the systems investigated, the results presented provide a convenient framework for the analysis of more complex systems as well.

23977 (CONF-9506200–1) **The relative degree enhancement problem for MIMO nonlinear systems.** Schoenwald, D.A. (Oak Ridge National Lab., TN (United States)); Oezguener, Ue. Oak Ridge National Lab., TN (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. From International Federation on Automatic Control (IFAC) symposium on nonlinear control systems design; Tahoe City, CA (United States); 25-28 Jun 1995. Order Number DE95013983. Source: OSTI; NTIS; GPO Dep.

The authors present a result for linearizing a nonlinear MIMO system by employing partial feedback - feedback at all but one input-output channel such that the SISO feedback linearization problem is solvable at the remaining input-output channel. The partial feedback effectively enhances the relative degree at the open input-output channel provided the feedback functions are chosen to satisfy relative degree requirements. The method is useful for nonlinear systems that are not feedback linearizable in a MIMO sense. Several examples are presented to show how these feedback functions can be computed. This strategy can be combined with decentralized observers for a completely decentralized feedback linearization result for at least one input-output channel.

23978 (CONF-9506200–2) **Stabilization of nonlinear systems with parametric uncertainty using variable structure techniques.** Schoenwald, D.A. (Oak Ridge National Lab., TN (United States)); Oezguener, Ue. Oak Ridge National Lab., TN (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. From International Federation on Automatic Control (IFAC) symposium on nonlinear control systems design; Tahoe City, CA (United States); 25-28 Jun 1995. Order Number DE95013982. Source: OSTI; NTIS; GPO Dep.

The authors present a result on the robust stabilization of a class of nonlinear systems exhibiting parametric uncertainty. They consider feedback linearizable nonlinear systems with a vector of unknown constant parameters perturbed about a known value. A Taylor series of the system about the nominal parameter vector coupled with a feedback linearizing control law yields a linear system plus nonlinear perturbations. Via a structure matching condition, a variable structure control law is shown to exponentially stabilize the full system. The novelty of the result is that the linearizing coordinates are completely known since they are defined about the nominal parameter vector, and fewer restrictions are imposed on the nonlinear perturbations than elsewhere in the literature.

23979 (DOE/CE/23810–51F) **Investigation of flushing and clean-out methods for refrigeration equipment to ensure system compatibility. Quarterly technical progress report, September 15, 1994–December 15, 1994.** Byrne, J.J. (Integral Sciences, Inc., Columbus, OH (United States)). Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. Order Number DE95015361. Source: OSTI; NTIS; GPO Dep.

Integral Sciences Incorporated is engaged in Part 2 of ARTI Contract No. 660-52502 assessing methods for removing residual mineral oil during retrofits of refrigeration systems. Part 2 focuses on a low side oil separator technique for removing mineral oil from systems being retrofitted to use HFC-134a. The method appears less expensive than the current practice of three lubricant changes with polyolester and may effect an accelerated transition to HFC's. Testing and method verification has been performed using a refrigeration system located at ISI's facility. Two HFC-134a field retrofits employing this method will be implemented during the first quarter of 1995. A third and final field retrofit will also be performed to evaluate the advanced method in an R-502 conversion.

23980 (DOE/CE/23810–59) **Materials compatibility and lubricants research on CFC-refrigerant substitutes. Quarterly MCLR program technical progress report, January 1, 1995–March 31, 1995.** Szymurski, S.R.; Hourahan, G.C.; Godwin, D.S. Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States). Apr 1995. 107p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. Order Number DE95016148. Source: OSTI; NTIS; GPO Dep.

The Materials Compatibility and Lubricants Research (MCLR) program supports critical research to accelerate the introduction of CFC and HCFC refrigerant substitutes. The MCLR program addresses refrigerant and lubricant properties and materials compatibility. The primary elements of the work include data collection and dissemination, materials compatibility testing, and methods development. The work is guided by an Advisory Committee consisting of technical experts from the refrigeration and air-conditioning industry and government agencies. The Air-Conditioning and Refrigeration Technology Institute, Inc., (ARTI) manages and contracts multiple research projects and a data collection and dissemination effort. Detailed results from these projects are reported in technical reports prepared by each subcontractor.

23981 (DOE/MC–92113-4016) **Interactive Computer-Enhanced Remote Viewing System (ICERVS). Phase 2.** Tourtellott, J. Mechanical Technology, Inc., Latham, NY (United States). Nov 1994. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29113. Order Number DE95000086. Source: OSTI; NTIS; GPO Dep.

This report documents the results of the Phase 2 development of ICERVS. Supporting the USDOE missions in environmental restoration, ICERVS integrates capabilities for data acquisition, data visualization, data analysis, and geometric model synthesis in

a workstation-based system. The following sections trace ICERVS development from intermediate system design, prototyping of critical elements, and detailed design of seven subsystems through implementation of source code and system performance testing. As a result of Phase 2, ICERVS has demonstrated the combined capabilities of integration and display of 3D sensor data, and interactive synthesis and display of geometric shapes to model regions in 3D space. Such capabilities are essential to effective, efficient task planning, path planning, and collision avoidance in robotic remediation systems.

23982 (DOE/NE/37967–T10) **University Research Programs in Robotics annual technical progress report, June 1, 1994–May 31, 1995.** Florida Univ., Gainesville, FL (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86NE37967. Order Number DE95012909. Source: OSTI; NTIS; GPO Dep.

The University of Florida supported three technical areas within the US Department of Energy's Robotics Technology Development Program (RTDP) during this project period: Tank Waste Retrieval (TWR) Analysis Automation (CAA), and Cross-Cutting and Advanced Technology (CC&AT). This reports the technical progress made on the tasks for each of these areas. Detailed reports will be sent to the RTDP coordinator and the project area coordinators at the end of the project period.

23983 (HW–11321) **234-5 Project specification letter 234-41, 235-41 (Supplement D), Chemical Development Laboratory.** Work, J.B. Hanford Works, Richland, WA (United States). 22 Oct 1948. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95014057. Source: OSTI; NTIS; GPO Dep.

This letter itemizes the miscellaneous equipment and supplies not previously specified which should be ordered to equip the 234-5 Chemical Development Laboratory. Equipment currently carried in store stock is not included in this list. The vendor is given only to identify the item or as a suggested source of supply.

23984 (HW–24514) **Critical mass studies of plutonium solutions.** Kruesi, F.E.; Erkman, J.O.; Lanning, D.D. Hanford Works, Richland, WA (United States). 19 May 1952. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95013948. Source: OSTI; NTIS; GPO Dep.

The chain reacting conditions for plutonium nitrate in water solution have been examined experimentally for a variety of sizes of spheres and cylinders. The effects on the critical mass of the displacement of hydrogen and the addition of poisons to the fuel were measured in water tamped and bare reactors. In this report the data obtained in the investigation is presented graphically and in tables. Some preliminary analysis has been made yielding the results: (i) the absorption cross-section of Pu^{240} is 925 $\pm$ 200 barns and (ii) the minimum critical mass of Pu^{239} in water is 510 grams at concentration of about 33 grams per liter.

23985 (HW–25374) **Critical mass study of 231 process tanks.** Lanning, D.D. Hanford Works, Richland, WA (United States). 19 Aug 1952. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95014106. Source: OSTI; NTIS; GPO Dep.

An estimated minimum critical mass for each of the process vessels in the 231 Building has been calculated on the basis of critical mass data given in the P-11 Project Document HW-24514. The calculations are made assuming the plutonium to be a homogeneous mixture of precipitate and water with some slight neutron poisoning due to other elements. The precipitate is further assumed to have partially settled making an effectively infinite water reflector above the plutonium and hence reducing the critical mass.

23986 (KCP–613-5570) **Risk management in design engineering bids.** Hudgins, D.W. (AlliedSignal Inc., Kansas City, MO (United States). Kansas City Division); Lavelle, J.P. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Jun 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. (CONF-9505235–1: Industrial Engineering Research conference, Nashville, TN (United States), 25-26 May 1995). Order Number DE95013996. Source: OSTI; NTIS; GPO Dep.

Accurate engineering cost estimates are critical in developing bids for new work, and for effective resource allocation and project control. This study reports on design estimating methods found in the literature, and on the results of two empirical studies of how estimating techniques are used in professional practice and their accuracy. The study found great reliance on a classic "activity analysis" approach to estimating design resources, and significant hazards in commonly used parametric techniques. The study found that project managers expect their estimates to be accurate (with 80% confidence interval) of between -10% to +25%. The study also found that actual bids between engineering firms had a much greater range (-40% to +45%) than can be explained by accuracy. Perhaps most importantly the study found that none of the sampled design firms used probabilistic techniques to optimize their project bids or to manage financial risk in view of the uncertainty of their estimates. The study concludes with techniques to reduce risk, and recommended future study.

23987 (LBL-PUB–754, pp. 3-11) **A compact permanent magnet cyclotrino for accelerator mass spectrometry.** Young, A.T. (Lawrence Berkeley Lab., CA (United States)); Clark, D.J.; Kunkel, W.B.; Leung, K.N.; Li, C.Y. Lawrence Berkeley Lab., CA (United States). Feb 1995. DOE Contract AC03-76SF00098. In *The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.* 202p. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

The authors describe the development of a new instrument for the detection of trace amounts of rare isotopes, a Cyclotron Mass Spectrometer (CMS). A compact low energy cyclotron optimized for high mass resolution has been designed and has been fabricated. The instrument has high sensitivity and is designed to measure carbon-14 at abundances of $< 10^{-12}$. A novel feature of the instrument is the use of permanent magnets to energize the iron poles of the cyclotron. The instrument uses axial injection, employing a spiral inflector. The instrument has been assembled and preliminary measurements of the magnetic field show that it has a uniformity on the order of 2 parts in 10^4.

23988 (LBL-PUB–754, pp. 75-84) **Halbach arrays in precision motion control.** Trumper, D.L. (Massachusetts Institute of Technology, Cambridge, MA (United States)); Williams, M.E. Lawrence Berkeley Lab., CA (United States). Feb 1995. In *The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.* 202p. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

The Halbach array was developed for use as an optical element in particle accelerators. Following up on a suggestion from Klaus Halbach, the authors have investigated the utility of such arrays as the permanent magnet structure for synchronous machines in cartesian, polar, and cylindrical geometries. Their work has focused on the design of a novel Halbach array linear motor for use in a magnetic suspension stage for photolithography. This paper presents the details of the motor design and its force and power characteristics.

23989 (LBL-PUB–754, pp. 85-100) **Halbach array motor/generators: A novel generalized electric machine.** Merritt, B.T. (Lawrence Livermore National Lab., CA (United States)); Post, R.F.; Dreifuerst, G.R.; Bender, D.A. Lawrence Berkeley Lab., CA (United States). Feb 1995. In *The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.* 202p. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

For many years Klaus Halbach has been investigating novel designs for permanent magnet arrays, using advanced analytical approaches and employing a keen insight into such systems. One of his motivations for this research was to find more efficient means for the utilization of permanent magnets for use in particle accelerators and in the control of particle beams. As a result of his pioneering work, high power free-electron laser systems, such as the ones built at the Lawrence Livermore Laboratory, became feasible, and his arrays have been incorporated into other particle-focusing systems of various types. This paper reports another, quite different, application of Klaus' work, in the design of high power, high efficiency, electric generators and motors. When

tested, these motor/generator systems display some rather remarkable properties. Their success derives from the special properties which these arrays, which the authors choose to call "Halbach arrays," possess.

23990 (LBL-PUB–754, pp. 175-181) **Optimum coil shape for a given volume of conductor to obtain maximum central field in an air core solenoid.** Hernandez, P. (Lawrence Berkeley Lab., CA (United States)). Lawrence Berkeley Lab., CA (United States). Feb 1995. In *The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.* 202p. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

This paper is an expansion of engineering notes prepared in 1961 to address the question of how to wind circular coils so as to obtain the maximum axial field with the minimum volume of conductor. At the time this was a germain question because of the advent of superconducting wires which were in very limited supply, and the rapid push for generation of very high fields, with little concern for uniformity.

23991 (ORNL–6817) **Instrumentation and Controls Division Progress report, July 1, 1992–June 30, 1994.** McDonald, D.W. Oak Ridge National Lab., TN (United States). Jun 1995. 105p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95014466. Source: OSTI; NTIS; GPO Dep.

The Instrumentation and Controls (I&C) Division serves a national laboratory, and as such has an expansive domain: science, industry, and national defense. The core mission is to support the scientific apparatus of the Laboratory and all of the systems that protect the safety and health of people and the environment. Progress is reported for the five sections: photonics and measurements systems, electronic systems, signal processing, controls and systems integration, and technical support.

23992 (ORNL/TM–12374) **Criticality safety studies of Building 3019 Cell 4 and in-line storage wells.** Primm, R.T. III. Oak Ridge National Lab., TN (United States). Nov 1993. 151p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95016201. Source: OSTI; NTIS; INIS; GPO Dep.

New fissile material load limits for storage facilities located in Building 3019 are derived in a manner consistent with currently applicable Martin Marietta Energy Systems requirements. The limits for ^{233}U loading are 2.00, 1.80, 1.45, and 0.19 kg/ft for hydrogen-to-^{233}U atoms ratios of 3, 5, 10, and unrestricted, respectively. Limits were also found for ^{235}U and ^{239}Pu systems. The KENO-Va Monte Carlo Program and Hansen-Roach cross sections were used to derive these limits.

23993 (ORNL/TM–12732) **Prediction of parallel NIKE3D performance on the KSR1 system.** Su, P.S. (Oak Ridge National Lab., TN (United States)); Zacharia, T.; Fulton, R.E. Oak Ridge National Lab., TN (United States). May 1995. 14p. Sponsored by USDOE, Washington, DC (United States);Oak Ridge Inst. for Science and Education, TN (United States). DOE Contract AC05-84OR21400. Order Number DE95014486. Source: OSTI; NTIS; GPO Dep.

Finite element method is one of the bases for numerical solutions to engineering problems. Complex engineering problems using finite element analysis typically imply excessively large computational time. Parallel supercomputers have the potential for significantly increasing calculation speeds in order to meet these computational requirements. This paper predicts parallel NIKE3D performance on the Kendall Square Research (KSR1) system. The first part of the prediction is based on the implementation of parallel Cholesky (U^TDU) matrix decomposition algorithm through actual computations on the KSR1 multiprocessor system, with 64 processors, at Oak Ridge National Laboratory. The other predictions are based on actual computations for parallel element matrix generation, parallel global stiffness matrix assembly, and parallel forward/backward substitution on the BBN TC2000 multiprocessor system at Lawrence Livermore National Laboratory. The preliminary results indicate that parallel NIKE3D performance can be attractive under local/shared-memory multiprocessor system environments.

23994 (ORNL/TM–12813-Pt.2) **New insights into input relegation control for inverse kinematics of a redundant manipulator. Part 2, The optimization of a secondary criteria involving self motion of the joints.** Unseren, M.A. Oak Ridge National Lab., TN (United States). Jul 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95014899. Source: OSTI; NTIS; GPO Dep.

The input relegation control (IRC) technique for redundancy resolution is extended to solve the problem of optimizing a scalar performance criteria representing a secondary objective to be accomplished via self motion of the joints. The criteria is defined to be the error between the vector of joint velocities and a new vector of "corrective' joint velocities, which is minimized in a Eudidean norm sense. The corrective velocities represent a 'corrective' action to be applied to the system and axe projected into the null space of the Jacoblan in the solution for the joint velocities. The report demonstrates that there exists a component in the solution for the joint velocities that induces self motion of the joints but is not a function of the "corrective action". A technique for eliminating this undesired component is presented. The method is compared to the well known gradient projection technique and its advantages are discussed.

23995 **Flexible pipe crawling device.** Zollinger, W.T. 1993. Filed date 24 May 1993. U.S. Patent Application 8-064,880. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95015045. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of an apparatus for moving through the linear and non-linear segments of piping systems. The apparatus comprises a front leg assembly, a rear leg assembly, means for extension and retraction of said front and rear leg assembles with respect to each other, such as an air cylinder, and a pivoting joint. One end of the flexible joint attaches to the front leg assembly and the other end to the air cylinder, which is also connected to the rear leg assembly. The air cylinder allows the front and rear leg assemblies to progress through pipe in "inchworm" fashion, while the joint provides the flexibility necessary for the pipe crawler to negotiate non-linear piping segments. The flexible connecting joint is coupled with a spring-force suspension system that urges alignment of the front and rear leg assemblies with respect to each other. The joint and suspension system cooperate to provide a firm yet flexible connection between the front and rear leg assemblies to allow the pivoting of one with respect to the other while moving around a non-linear pipe segment, but restoring proper alignment coming out of the pipe bend.

23996 **Carbon-assisted flyer plates.** Paisley, D.L.; Stahl, D.B. 1993. Filed date 28 May 1993. U.S. Patent Application 8-068,032. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95015039. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of a laser driven flyer plate utilizing an optical fiber connected to a laser. The end of the optical fiber has a layer of carbon and a metal layer deposited onto it. The carbon layer provides the laser induced plasma which is superior to the plasma produced from most metals. The carbon layer plasma is capable of providing a flatter flyer plate, converting more of the laser energy to driving plasma, promoting a higher flyer plate acceleration, and providing a more uniform pulse behind the plate. In another embodiment, the laser is in optical communication with a substrate onto which a layer of carbon and a layer of metal have been deposited.

23997 (PNL-SA–24733) **TEDANN: Turbine engine diagnostic artificial neural network.** Kangas, L.J. (Pacific Northwest Lab., Richland, WA (United States)); Greitzer, F.L.; Illi, O.J. Jr. Pacific Northwest Lab., Richland, WA (United States). 17 Mar 1994. 16p. Sponsored by Department of Defense, Washington, DC (United States). (CONF-9403233–1: Advanced information systems and technology conference, Williamsburg, VA (United States), 28-30 Mar 1994). Order Number DE95014609. Source: OSTI; NTIS; GPO Dep.

The initial focus of TEDANN is on AGT-1500 fuel flow dynamics: that is, fuel flow faults detectable in the signals from the Electronic

Control Unit's (ECU) diagnostic connector. These voltage signals represent the status of the Electro-Mechanical Fuel System (EMFS) in response to ECU commands. The EMFS is a fuel metering device that delivers fuel to the turbine engine under the management of the ECU. The ECU is an analog computer whose fuel flow algorithm is dependent upon throttle position, ambient air and turbine inlet temperatures, and compressor and turbine speeds. Each of these variables has a representative voltage signal available at the ECU's J1 diagnostic connector, which is accessed via the Automatic Breakout Box (ABOB). The ABOB is a firmware program capable of converting 128 separate analog data signals into digital format. The ECU's J1 diagnostic connector provides 32 analog signals to the ABOB. The ABOB contains a 128 to 1 multiplexer and an analog-to-digital converter, CP both operated by an 8-bit embedded controller. The Army Research Laboratory (ARL) developed and published the hardware specifications as well as the micro-code for the ABOB Intel EPROM processor and the internal code for the multiplexer driver subroutine. Once the ECU analog readings are converted into a digital format, the data stream will be input directly into TEDANN via the serial RS-232 port of the Contact Test Set (CTS) computer. The CTS computer is an IBM compatible personal computer designed and constructed for tactical use on the battlefield. The CTS has a 50MHz 32-bit Intel 80486DX processor. It has a 200MB hard drive and 8MB RAM. The CTS also has serial, parallel and SCSI interface ports. The CTS will also host a frame-based expert system for diagnosing turbine engine faults (referred to as TED; not shown in Figure 1).

23998 (PNL-SA–25597) **Development of a flexible thermosyphon for cooling a concentrated heat source.** McKee, R.S.; Hobbs, F.D. Pacific Northwest Lab., Richland, WA (United States). May 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9505155–3: 9. international heat pipe conference, Albuquerque, NM (United States), 1-5 May 1995). Order Number DE95014608. Source: OSTI; NTIS; GPO Dep.

A flexible tubular thermosyphon was developed for the purpose of cooling a concentrated heat source. Designed to fold 180° for storage and unfold for operation, the thermosyphon is made of copper and uses water as the working fluid. Its integral flex-joint has several advantages over conventional flexible joints. A unique boiling enhancement improved the liquid-to-vapor phase change while minimizing the conduction-temperature drop from the tube wall to the fluid, and was found to perform better than a screen wick in the evaporator. A study of the power limits and of other working fluids was conducted with the HTPIPE computer code (Los Alamos). Power limits were calculated to be far in excess of what was needed, but experiments revealed that the limits were significantly lower. Water was predicted to be the best working fluid at the operational temperature range but this was not experimentally verified.

23999 (PNL-SA–26161) **Micro-manipulator motion control to suppress macro-manipulator structural vibrations.** Lew, J.Y.; Trudnowski, D.J.; Evans, M.S.; Bennett, D.W. Pacific Northwest Lab., Richland, WA (United States). May 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9505193–5: 1995 international conference on robotics and automation, Nagoya (Japan), 21-27 May 1995). Order Number DE95014614. Source: OSTI; NTIS; GPO Dep.

The feasibility of several pyrochemical approaches for separating non-radioactive constituents from ICPP BLW calcine were examined. The removal of aluminum as $AlCl_3$ from aluminia calcine was successfully demonstrated. The examination of pyrochemical processes to remove non-radioactive constituents, primarily aluminium, zirconium, calcium and fluorine, from zirconia calcine showed that fluorine removal was required inorder to chlorinate the calcine. A molten calcium chloride wash, a calcium reduction, and a sulfuric acid treatment were examined as possible zirconia calcine pretreatment options for fluorine removal. Fluorine removal from simulated ICPP zirconia calcine was demonstrated by both a $CaCl_2$ wash method and a sulfuric acid treatment method. X-ray fluorescence analysis indicated that greater than 97% of the fluorine can be removed by either method. Fluorine removal by a calcium reduction using an alloying agent, zinc, or a calcium reduction using a filtration separation were also demonstrated, but the efficiencies of fluorine removal were considerably less ranging from 50 to 90%.

24000 (SAND–95-0849C) **Motion planning for multiple moving objects.** Hwang, Y.K. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9508119–1: 1. international symposium on assembly and task planning, Pittsburgh, PA (United States), 10-11 Aug 1995). Order Number DE95011888. Source: OSTI; NTIS; GPO Dep.

We present a motion planner for multiple moving objects in two dimensions. The search for collision-free paths is performed in the composite configuration space of all the moving objects to guarantee a solution, and the efficiency of our planner is demonstrated with examples. Our motion planner can be characterized with a hierarchical, multi-resolution search of the configuration space along with a generate-and-test paradigm for solution paths. Because of the high dimensionality of the composite configuration space, our planner is most useful for cases with a small number of moving objects. Some of the potential applications are navigation of several mobile robots, and planning part motions for a multi-handed assembly operation.

24001 (SAND–95-0935C) **Determination of modal residues and residual flexibility for time-domain system realization.** Alvin, K.F. (Sandia National Labs., Albuquerque, NM (United States)); Peterson, L.D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9509140–2: 15. ASME international computer in engineering conference, Boston, MA (United States), 17-21 Sep 1995). Order Number DE95011884. Source: OSTI; NTIS; GPO Dep.

A linear least-squares procedure for the determination of modal residues using time-domain system realization theory is presented. The present procedure is shown to be theoretically equivalent to residue determination in realization algorithms such as the Eigensystem Realization Algorithm (ERA) and Q-Markov COVER. However, isolating the optimal residue estimation problem from the general realization problem affords several advantages over standard realization algorithms for structural dynamics identification. Primary among these are the ability to identify data sets with large numbers of sensors using small numbers of reference point responses, and the inclusion of terms which accurately model the effects of residual flexibility. The accuracy and efficiency of the present realization theory-based procedure is demonstrated for both simulated and experimental data.

24002 (SAND–95-1195C) **Command shaping for residual vibration free crane maneuvers.** Parker, G.G.; Petterson, B.; Dohrmann, C.; Robinett, R.D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950653–2: 1995 American control conference, Seattle, WA (United States), Jun 1995). Order Number DE95013864. Source: OSTI; NTIS; GPO Dep.

Cranes used in the construction and transportation industries are generally devices with multiple degrees of freedom including variable load-line length, variable jib length (usually via a trolley), and variable boom angles. Point-to-point payload maneuvers using cranes are performed so as not to excite the spherical pendulum modes of their cable and payload assemblies. Typically, these pendulum modes, although time-varying, exhibit low frequencies. Current crane maneuvers are therefore performed slowly contributing to high construction and transportation costs. This investigation details a general method for applying command shaping to various multiple degree of freedom cranes such that the payload moves to a specified point without residual oscillation. A dynamic programming method is used for general command shaping for optimal maneuvers. Computationally, the dynamic programming approach requires order M calculations to arrive at a solution, where M is the number of discretizations of the input commands. This feature is exploited for the crane command shaping problem allowing for rapid calculation of command histories. Fast generation of commands is a necessity for practical use of command shaping for the applications described in this work. These results are compared to

near-optimal solutions where the commands are linear combinations of acceleration pulse basis functions. The pulse shape is required due to hardware requirements. The weights on the basis functions are chosen as the solution to a parameter optimization problem solved using a Recursive Quadratic Programming technique. Simulation results and experimental verification for a variable load-line length rotary crane are presented using both design procedures.

24003 (SAND–95-1235C) **Current status and future research in motion planning.** Hwang, Y.K. Sandia National Labs., Albuquerque, NM (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9508119–2: 1. international symposium on assembly and task planning, Pittsburgh, PA (United States), 10-11 Aug 1995). Order Number DE95013868. Source: OSTI; NTIS; GPO Dep.

There have been numerous research efforts in the field of motion planning, resulting in many theoretical and practical results. We review the current status of existing motion planning algorithms, evaluate their completeness and efficiencies on modern computers, and suggest fruitful future research directions.

24004 (SAND–95-1272C) **High shock, high frequency characteristics of a mechanical isolator for a piezoresistive accelerometer.** Bateman, V.I. (and others); Brown, F.A.; Davie, N.T. Sandia National Labs., Albuquerque, NM (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9506213–1: 18. transducer workshop, Colorado Springs, CO (United States), 20-22 Jun 1995). Order Number DE95014604. Source: OSTI; NTIS; GPO Dep.

A mechanical isolator has been developed for a piezoresistive accelerometer. The purpose of the isolator is to mitigate high frequency shocks before they reach the accelerometer because the high frequency shocks may cause the accelerometer to resonate. Since the accelerometer is undamped, it often breaks when it resonates. The mechanical isolator was developed in response to impact test requirements for a variety of structures at Sandia National Laboratories. An Extended Technical Assistance Program with the accelerometer manufacturer has resulted in a commercial isolator that will be available to the general public. This mechanical isolator has ten times the bandwidth of any other commercial isolator and has acceptable frequency domain performance from DC to 10 kHz (± 10%) over a temperature range of -65°F to +185°F as demonstrated in this paper.

24005 (SAND–95-8564C) **The expanded role of software in a control system.** Damico, J.P. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9507127–1: National Instruments week, Austin, TX (United States), 23 Jul 1995). Order Number DE95010762. Source: OSTI; NTIS; GPO Dep.

Disposal of hazardous wastes such as chemical waste and military munitions present a serious environmental challenge. A new technology, Supercritical Water oxidation (SCWO), provides a safer, cleaner process for disposing of these and other wastes. Sandia National Laboratories built a SCWO reactor, called the Engineering Evaluation Reactor (EER) to study the SCWO process. Designed as a flexible testbed, the EER required a control system that would accommodate a variety of experimental instruments, configurations and control schemes. Safety concerns required that the control system remotely operate the reactor. In the past, such a control system would be custom built from hardware components. The EER control system implemented many hardware functions in software and proved more flexible than a hardware oriented system. This paper describes the design and implementation of the EER control and data acquisition system and discusses the advantages of a software based control system. The EER control system forms a virtual instrument by incorporating all reactor controls and sensor data displays into a graphical user interface. The operator remotely controls the reactor with a mouse and observes the reactor status from onscreen displays. In more hardware oriented designs, the system controls, like switches, dials, and panel meters, are mounted in instrument panels. The instrument panels can be designed to present an intuitive user interface, but modifications to the experiment would require expensive control panel hardware modifications. Often, the control system interface does not reflect experiment changes and becomes nonintuitive and unsafe. Considering the constant changes planned for the EER, we implemented the control system using software wherever possible.

24006 (UCRL-JC–117482) **Recent test results of a warm gas pumped monopropellant propulsion system.** Frei, T.E. (Olin Aerospace Co., Redmond, WA (United States)); Maybee, J.C.; Whitehead, J.C. Lawrence Livermore National Lab., CA (United States). 13 Jun 1994. 14p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940623–3: 30. joint propulsion conference and exhibit, Indianapolis, IN (United States), 27-29 Jun 1994). Order Number DE95011694. Source: OSTI; NTIS; GPO Dep.

Updated test results from system level testing of an advanced pumped hydrazine propulsion system are presented. The results are from testing the next iteration of a system previously tested in 1991 through 1993. This novel propulsion system is the central part of a miniature maneuvering vehicle which has been presented and discussed in various configurations in previous papers and recently successfully flight tested on the ASTRID rocket. Noteworthy design features include flight packaging of the propulsion system (excluding tanks), enabled by the use of a flight design thrust control valve assembly and a miniature gas generator (GG) fuel control valve (13 gms). The pumped propulsion system is a significant achievement in state-of-the-art hydrazine system performance, achieved largely through the use of free-piston warm gas pumps 3.6.7. The pumps enable high performance by using low pressure and thus light weight propellant tank(s). A GG provides warm gas to both drive the pumps and for tank repressurization via a pressure reducing valve. The pumps boost the fuel pressure from tank pressure (60 psig) up to 1200 psig. The high pressure fuel is fed to the light weight high performance thrusters (56 lbf thrust) and to the GG, regulated to 960 psi. The recent testing includes a 60-second steady-state firing and dual thruster firing at sea level, in addition to boostrap and pulse mode firings. At the completion of this testing the system operation was nominal and further life margin testing is currently under-way. Additionally, future work includes transfer of this technology and its performance benefits to civilian/commercial launch vehicle staging.

24007 (UCRL-JC–117890) **Evaporation monitoring and composition control of alloy systems with widely differing vapor pressures.** Anklam, T.M.; Berzins, L.V.; Braun, D.G.; Haynam, C.; McClelland, M.A.; Meier, T. Lawrence Livermore National Lab., CA (United States). Oct 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9410109–1: 11. electron beam melting and refining conference - state of the art 1994, Reno, NV (United States), 30 Oct - 1 nov 1994). Order Number DE95011764. Source: OSTI; NTIS; INIS; GPO Dep.

Lawrence Livermore National Laboratory is developing sensors and controls to improve and extend electron beam materials processing technology to alloy systems with constituents of widely varying vapor pressure. The approach under development involves using tunable lasers to measure the density and composition of the vapor plume. A laser based vaporizer control system for vaporization of a uranium-iron alloy has been previously demonstrated in multi-hundred hour, high rate vaporization experiments at LLNL. This paper reviews the design and performance of the uranium vaporization sensor and control system and discusses the extension of the technology to monitoring of uranium vaporization. Data is presented from an experiment in which titanium wire was fed into a molten niobium pool. Laser data is compared to deposited film composition and film cross sections. Finally, the potential for using this technique for composition control in melting applications is discussed.

24008 (UCRL-JC–118151) **New infrared solid state laser materials for CALIOPE.** DeLoach, L.D. (and others); Page, R.H.; Wilke, G.D. Lawrence Livermore National Lab., CA (United States). 1 Aug 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9404162–20:

1994 chemical analysis by laser interrogation of proliferation effluents (CALIOPE ITR) interim technical review, Livermore, CA (United States), 26-28 Apr 1994). Order Number DE95014160. Source: OSTI; NTIS; INIS; GPO Dep.

Tunable infrared laser light may serve as a useful means by which to detect the presence of the targeted effluents. Since optical parametric oscillators (OPOs) have proven to be a versatile method of generating coherent light from the ultraviolet to the mid-infrared, this technology is a promising choice by which to service the CALIOPE applications. In addition, since some uncertainty remains regarding the precise wavelengths and molecules that will be targeted, the deployment of OPOs retains the greatest amount of wavelength flexibility. Another approach that the authors are considering is that of generating tunable infrared radiation directly with a diode-pumped solid state laser (DPSSL). One important advantage of a DPSSL is that it offers flexible pulse format modes that can be tailored to meet the needs of a particular application and target molecule. On the other hand, direct generation by a tunable DPSSL will generally be able to cover a more limited wavelength range than is possible with OPO technology. In support of the CALIOPE objectives the authors are exploring the potential for laser action among a class of materials comprised of transition metal-doped zinc chalcogenide crystals (i.e., ZnS, ZnSe and ZnTe). The Cr^{2+}, Co^{2+} and Ni^{2+} dopants were selected as the most favorable candidates, on the basis of their documented spectral properties in the scientific literature. Thus far, the authors have characterized the absorption and emission properties of these ions in the ZnS and ZnSe crystals. The absorption spectra are used to determine the preferred wavelength at which the crystal should be pumped, while the emission spectra reveal the extent of the tuning range potentially offered by the material. In addition, measurements of the emission lifetime as a function of temperature turn out to be quite useful, since this data is suggestive of the room temperature emission yield.

24009 (UCRL-JC–118185) **Process simulator for time-dependent material and energy flow in a continuous casting system.** Westerberg, K.W. (Aspen Technology, Inc., Cambridge, MA (United States)); McClelland, M.A. Lawrence Livermore National Lab., CA (United States). 6 Feb 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9509118–7: Modeling of casting, welding and advanced solidification processes 7, London (United Kingdom), 10-15 Sep 1995). Order Number DE95014695. Source: OSTI; NTIS; GPO Dep.

A process simulator is developed for the material and energy flow in a continuous casting system which utilizes an electron-beam energy source. A time-dependent, one-dimensional model is used which accounts for energy transport within the ingot and transport to the surroundings by conduction, thermal radiation, and the formation of secondary electrons. Also included are the mass and energy additions associated with the poured metal. A modified finite element method is used to solve the energy equation while tracking boundaries at the pool surface and solidification zone. Model parameters are determined using results from a steady-state experiment and a more detailed two-dimensional model for fluid flow and energy transport. For a transient experiment with pouring, a comparison is made between predicted and measured heat flows.

24010 (UCRL-JC–119080) **Near-surface current meter array measurements of internal gravity waves.** Mantrom, D.D.; Jones, H.E.; Chambers, D.H. Lawrence Livermore National Lab., CA (United States). 3 Nov 1994. 8p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950244–1: 5. IEEE working conference on current measurement: upper ocean, boundary layer, moving platform, and non-invasive current measurements, St. Petersburg, FL (United States), 7-9 Feb 1995). Order Number DE95011697. Source: OSTI; NTIS; GPO Dep.

A measurement capability using a horizontal array of 10 S4 current meters mounted on a stiff floating structure with 35m aperture has been developed to support interpretation of radar imaging of surface effects associated with internal gravity waves. This system has been fielded three times and most recently, has collected data alongside the sea-surface footprint of a land-fixed radar imaging ship-generated internal waves. The underlying need for this measurement capability is described. The specifications resulting from this need are presented and the engineering design and deployment procedures of the platform and systems that resulted are described. The current meter data are multiplexed along with meteorological and system status data onboard the floating platform and are telemetered to a shore station and on to a data acquisition system. The raw data are recorded, and are then processed to form space-time images of current and strain rate (a spatial derivative of the current field). Examples of raw and processed data associated with ship-generated internal waves are presented.

24011 (UCRL-JC–120009) **Development of high damage threshold optics for petawatt-class short-pulse lasers.** Stuart, B.C. (and others); Perry, M.D.; Boyd, R.D. Lawrence Livermore National Lab., CA (United States). 22 Feb 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950226–52: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-14 Feb 1995). Order Number DE95014367. Source: OSTI; NTIS; INIS; GPO Dep.

The authors report laser-induced damage threshold measurements on pure and multilayer dielectrics and gold-coated optics at 1053 and 526 nm for pulse durations, τ, ranging from 140 fs to 1 ns. Damage thresholds of gold coatings are limited to 500 mJ/cm^2 in the subpicosecond range for 1053-nm pulses. In dielectrics, qualitative differences in the morphology of damage and a departure from the diffusion-dominated $\tau 1/2$ scaling indicate that damage results from plasma formation and ablation for $\tau \lesssim 10$ ps and from conventional melting and boiling for $\tau > 50$ ps. A theoretical model based on electron production via multiphoton ionization, Joule heating, and collisional (avalanche) ionization is in quantitative agreement with both the pulsewidth and wavelength scaling of experimental results.

24012 (UCRL-JC–120300) **Modeling the dynamic crush of impact mitigating materials.** Logan, R.W.; McMichael, L.D. Lawrence Livermore National Lab., CA (United States). 12 May 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950740–54: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95013268. Source: OSTI; NTIS; INIS; GPO Dep.

Crushable materials are commonly utilized in the design of structural components to absorb energy and mitigate shock during the dynamic impact of a complex structure, such as an automobile chassis or drum-type shipping container. The development and application of several finite-element material models which have been developed at various times at LLNL for DYNA3D will be discussed. Between the models, they are able to account for several of the predominant mechanisms which typically influence the dynamic mechanical behavior of crushable materials. One issue we addressed was that no single existing model would account for the entire gambit of constitutive features which are important for crushable materials. Thus, we describe the implementation and use of an additional material model which attempts to provide a more comprehensive model of the mechanics of crushable material behavior. This model combines features of the pre-existing DYNA models and incorporates some new features as well in an invariant large-strain formulation. In addition to examining the behavior of a unit cell in uniaxial compression, two cases were chosen to evaluate the capabilities and accuracy of the various material models in DYNA. In the first case, a model for foam filled box beams was developed and compared to test data from a 4-point bend test. The model was subsequently used to study its effectiveness in energy absorption in an aluminum extrusion, spaceframe, vehicle chassis. The second case examined the response of the AT-400A shipping container and the performance of the overpack material during accident environments selected from 10CFR71 and IAEA regulations.

24013 (UCRL-JC-120672) **Modeling, monitoring and control based on neural networks.** Fu, Chi Yung. Lawrence Livermore National Lab., CA (United States). 14 Apr 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950412–15: Spring meeting of the Materials Research Society (MRS), San Francisco, CA (United

States), 17-21 Apr 1995). Order Number DE95012455. Source: OSTI; NTIS; GPO Dep.

The cost of a fabrication line such as one in a semiconductor house has increased dramatically over the years and it is possibly already past the point that some new start-up company can have sufficient capital to build a new fabrication line. Such capital-intensive manufacturing needs better utilization of resources and management of equipment to maximize its productivity. In order to maximize the return from such a capital-intensive manufacturing line, we need to address the following: (1) increasing the yield, (2) enhancing the flexibility of the fabrication line, (3) improving quality, and finally (4) minimizing the down time of the processing equipment. Because of the significant advances now made in the fields of artificial neural networks, fuzzy logic, machine learning and genetic algorithms, we advocate the use of these new tools to in manufacturing. We term the applications of these and other tools that mimic human intelligence to manufacturing neural manufacturing. This paper will address the effort at Lawrence Livermore National Laboratory (LLNL) to use artificial neural networks to address certain semiconductor process modeling, monitoring and control questions.

24014 (WHC-EP–0859) **Measurements of the corrosion of low-carbon steel drums under environmental conditions at Hanford: One-year test results.** Duncan, D.R. (Westinghouse Hanford Co., Richland, WA (United States)); Bunnell, L.R. Westinghouse Hanford Co., Richland, WA (United States). May 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95015548. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the methods used to expose low-carbon steel drums to atmospheric and soil corrosion and describes the methods used to examine specimens retrieved from both types of tests. These drums are being tested to meet requirements of radioactive waste storage for both low-level radioactive wastes and transuranic wastes.

24015 (WHC-SD-RTG-TC–006-Rev.1) **Test plan/procedure for the shock limiting device of the radioisotope thermoelectric generator package mounting subsystem 145. Revision 1.** Satoh, J.A. Westinghouse Hanford Co., Richland, WA (United States). 25 May 1995. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013904. Source: OSTI; NTIS; GPO Dep.

This document defines the procedure to be used in the 18 inch drop test to be used for design verification of the RTG Transportation System Package Mounting.

24016 (WHC-SD-SQA-CSA–20394) **CSER 95-003: Exemption from Criticality Alarm System requirement for 232-Z building.** Nirider, L.T.; Miller, E.M. Westinghouse Hanford Co., Richland, WA (United States). 18 May 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95013340. Source: OSTI; NTIS; INIS; GPO Dep.

This CSER establishes an exemption for 232-Z from the requirement for a Criticality Alarm System, because the formation of a critical configuration is not a credible event for any circumstance involving the cleaning out and removal of the Burning Hood and associated equipment.

24017 (WHC-SD-TP-TP–007) **Test plan/procedure for the SPM-1 shipping container system. Revision 0.** Flanagan, B.D. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95014426. Source: OSTI; NTIS; INIS; GPO Dep.

The 49 CFR 173.465 Type A packaging tests will verify that SPM-1 will provide adequate protection and pass as a Type A package. Test will determine that the handle of the Pig will not penetrate through the plywood spacer and rupture the shipping container. Test plan/procedure provides planning, pre-test, setup, testing, and post-testing guidelines and procedures for conducting the "Free Drop Test" procedure for the SPM-1 package.

24018 (ANL/IFR/CP–84612) **Hydrodynamic studies of post dryout two-phase downflow in narrow channels.** Eberle, C.S. (Argonne National Lab., Idaho Falls, ID (United States)); Ishii, M.; Revankar, S.T. Argonne National Lab., Idaho Falls, ID (United States). [1995]. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950828–13: National heat transfer conference, Portland, OR (United States), 5-9 Aug 1995). Order Number DE95014081. Source: OSTI; NTIS; INIS; GPO Dep.

An experimental study of the hydrodynamics of a narrow channel was performed in order to obtain the heat transfer mechanisms and influences contributing to the flow regime transition from inverted annular to inverted slug flows for post dryout downflow. The experimental series consisted of both adiabatic and diabatic visualization tests over a wide range of fluid and thermal parameters. The system inlet gas velocities ranged from 0 to 14 meters per second while the inlet fluid velocities ranged from 1 to 3 meters per second. Full extent visualization of the flow regime was possible due to a quartz tube in tube construction with a clear heating fluid. Constant temperature heating of the freon was accomplished at bulk fluid temperatures above the critical heat flux temperature. For each hydrodynamic flow condition, one to three minuets of VHS-video filming was performed to acquire both flow regime and break-up length data. In addition to this the flow field parameters were recorded simultaneously with the filming.

24019 (DOE/ER/13757–T6) **Fluid dynamics of double diffusive systems. Final report.** Koseff, J.R. Stanford Univ., CA (United States). Dept. of Civil Engineering. [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-87ER13757. Order Number DE95015455. Source: OSTI; NTIS; GPO Dep.

Over the past seven years the authors have conducted an experimental, numerical, and theoretical study of the stability of doubly diffusive systems, and of mixing processes in stratified turbulence. For the study of the stability of doubly diffusive systems continuous gradients of two diffusing components (heat and salinity in this case) were used as the initial condition, and forcing was introduced by lateral heating and surface shear. The goals of this work included (1) quantification of the effects of finite amplitude disturbances on stable, double diffusive systems, particularly with respect to lateral heating, (2) development of an improved understanding of the physical phenomena present in sheardriven flows in doubly diffusive stratified environments, (3) increasing their knowledge-base on turbulent flow in stratified environments and how to represent it, and (4) formulation of a numerical code for such flows. In particular, the overall goals of this aspect of the research were as follows: (1) develop more general stability and scaling criteria for the destabilization of doubly-stratified systems, (2) study the variation of flow structure and scales with Rayleigh ratio and lateral heating ratio, (3) delineate the mechanisms governing convective layer formation and merging, (4) study the mixing processes within the convective layers and across interfaces, and estimate the heat and mass fluxes in such a system, (5) quantify the effects of turbulence and coherent structures (due to a wind-driven surface shear) on a doubly stratified system, and (6) study the interaction between surface shear and side-wall heating destabilization mechanisms. Goals 1 through 4 have been successfully completed and the results are described in this report.

24020 (DOE/ER/14045–10) **Development and use of image scanning ellipsometer to study the dynamics of heated thin liquid films. Progress report, July 1, 1989–December 31, 1994.** Wayner, P.C. Jr.; Plawsky, J.L. Rensselaer Polytechnic Inst., Troy, NY (United States). Jan 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER14045. Order Number DE95013812. Source: OSTI; NTIS; GPO Dep.

Long-term objective is to determine heat transfer and stability of evaporating ultra-thin films, some of which may form permanent coatings. Goal is to develop and use a microscopic image-processing system (IPS) to measure the film thickness profile; the

IPS has two parts: an image analyzing interferometer and an image scanning ellipsometer.

24021 (DOE/PN/38195–T2) **Numerical calculation of two-phase turbulent jets.** Saif, A.A. Purdue Univ., Lafayette, IN (United States). May 1995. 95p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC11-93PN38195. Order Number DE95015702. Source: OSTI; NTIS; GPO Dep.

Two-phase turbulent round jets were numerically simulated using a multidimensional two-phase CFD code based on the two-fluid model. The turbulence phenomena were treated with the standard k-ϵ model. It was modified to take into account the additional dissipation of turbulent kinetic energy by the dispersed phase. Within the context of the two-fluid model it is more appropriate and physically justified to treat the diffusion by an interfacial force in the momentum equation. In this work, the diffusion force and the additional dissipation effect by the dispersed phase were modeled starting from the classical turbulent energy spectrum analysis. A cut-off frequency was proposed to decrease the dissipation effect by the dispersed phase when large size particles are introduced in the flow. The cut-off frequency combined with the bubble-induced turbulence effect allows for an increase in turbulence for large particles. Additional care was taken in choosing the right kind of experimental data from the literature so that a good separate effect test was possible for their models. The models predicted the experimental data very closely and they were general enough to predict extreme limit cases: water-bubble and air-droplet jets.

24022 (SAND–95-1189C) **A proposed methodology for computational fluid dynamics code verification, calibration, and validation.** Aeschliman, D.P.; Oberkampf, W.L.; Blottner, F.G. Sandia National Labs., Albuquerque, NM (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9507136–1: 16. international congress on instrumentation in aerospace simulation facilities, Dayton, OH (United States), 18-21 Jul 1995). Order Number DE95013862. Source: OSTI; NTIS; GPO Dep.

Verification, calibration, and validation (VCV) of Computational Fluid Dynamics (CFD) codes is an essential element of the code development process. The exact manner in which code VCV activities are planned and conducted, however, is critically important. It is suggested that the way in which code validation, in particular, is often conducted–by comparison to published experimental data obtained for other purposes–is in general difficult and unsatisfactory, and that a different approach is required. This paper describes a proposed methodology for CFD code VCV that meets the technical requirements and is philosophically consistent with code development needs. The proposed methodology stresses teamwork and cooperation between code developers and experimentalists throughout the VCV process, and takes advantage of certain synergisms between CFD and experiment. A novel approach to uncertainty analysis is described which can both distinguish between and quantify various types of experimental error, and whose attributes are used to help define an appropriate experimental design for code VCV experiments. The methodology is demonstrated with an example of laminar, hypersonic, near perfect gas, 3-dimensional flow over a sliced sphere/cone of varying geometrical complexity.

24023 (SAND–95-1196C) **A numerical model of 2-D sloshing of pseudo-viscous liquids in horizontally accelerated rectangular containers.** Romero, V.J. (Sandia National Labs., Albuquerque, NM (United States)); Ingber, M.S. Sandia National Labs., Albuquerque, NM (United States). [1995]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9507125–2: BEM 17: Boundary element methods, Madison, WI (United States), 17-19 Jul 1995). Order Number DE95013860. Source: OSTI; NTIS; GPO Dep.

A numerical model for simulating the transient nonlinear behavior of 2-D viscous sloshing flows in rectangular containers subjected to arbitrary horizontal accelerations is presented. The potential-flow formulation uses Rayleigh damping to approximate the effects of viscosity, and Lagrangian node movement is used to accommodate violent sloshing motions. A boundary element approach is used to efficiently handle the time-changing fluid geometry. Additionally, a corrected equation is presented for the constraint condition relating normal and tangential derivatives of the velocity potential where the fluid free surface meets the rigid container wall. The numerical model appears to be more accurate than previous sloshing models, as determined by comparison against exact analytic solutions and results of previously published models.

24024 (UCRL-JC–118609) **An adaptive multifluid interface-capturing method for compressible flow in complex geometries.** Greenough, J.A.; Beckner, V.; Pember, R.B.; Crutchfield, W.Y.; Bell, J.B.; Colella, P. Lawrence Livermore National Lab., CA (United States). Apr 1995. 10p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract W-7405-ENG-48 ; FG03-92ER25140. IACRO 95-2045, DMS-8919074. (CONF-950634–4: 26. American Institute of Aeronautics and Astronautics (AIAA) computational fluid dynamics conference, San Diego, CA (United States), 19-22 Jun 1995). Order Number DE95013273. Source: OSTI; NTIS; GPO Dep.

We present a numerical method for solving the multifluid equations of gas dynamics using an operator-split second-order Godunov method for flow in complex geometries in two and three dimensions. The multifluid system treats the fluid components as thermodynamically distinct entities and correctly models fluids with different compressibilities. This treatment allows a general equation-of-state (EOS) specification and the method is implemented so that the EOS references are minimized. The current method is complementary to volume-of-fluid (VOF) methods in the sense that a VOF representation is used, but no interface reconstruction is performed. The Godunov integrator captures the interface during the solution process. The basic multifluid integrator is coupled to a Cartesian grid algorithm that also uses a VOF representation of the fluid-body interface. This representation of the fluid-body interface allows the algorithm to easily accommodate arbitrarily complex geometries. The resulting single grid multifluid-Cartesian grid integration scheme is coupled to a local adaptive mesh refinement algorithm that dynamically refines selected regions of the computational grid to achieve a desired level of accuracy. The overall method is fully conservative with respect to the total mixture. The method will be used for a simple nozzle problem in two-dimensional axisymmetric coordinates.

24025 (UCRL-JC–118610) **Numerical simulation of a waveguide mixing layer on a Cray C-90.** Greenough, J.A.; Crutchfield, W.Y.; Rendleman, C.A. Lawrence Livermore National Lab., CA (United States). 19 May 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950634–3: 26. American Institute of Aeronautics and Astronautics (AIAA) computational fluid dynamics conference, San Diego, CA (United States), 19-22 Jun 1995). Order Number DE95013260. Source: OSTI; NTIS; GPO Dep.

The development of a three-dimensional spatially evolving compressible mixing layer is investigated numerically using a parallel implementation of Adaptive Mesh Refinement (AMR) on a Cray C-90. The parallel implementation allowed the flow to be highly resolved while significantly reducing the wall-clock runtime. A sustained computation rate of 5.3 Gigaflops including I/O was obtained for a typical production run on a 16 processor machine. A novel mixing layer configuration is investigated where a pressure mismatch is maintained between the two inlet streams. In addition, the sonic character of the two streams is sufficiently different so that the pressure relief wave is trapped in the high speed stream. The trapped wave forces the mixing layer to form a characteristic cellular pattern. The cellular structure introduces curvature into the mixing layer that excites centrifugal instabilities characterized by large-scale counter-rotating vortical pairs embedded within the mixing layer. These are the dominant feature of the flow. Visualizations of these structures in cross-section show the pumping action which lifts dense fluid up into light gas. This effect has a strong impact on mixing enhancement as monitored by a conserved scalar formulation. Once the large-scale structures axe well established in the flow and undergo intensification from favorable velocity gradients, the time-averaged integrated product shows almost a four-fold increase. A spectral analysis of the flow-field over the cellular structures. as part of a full space-time analysis, shows these structures to be zero-frequency modes that develop from low level essentially

broad-banded noise. This characterization of the vortical structures and their appearance is consistent with a recent linear stability analysis, of a mixing layer over a curved wall that predicts the most unstable modes to be zero frequency streamwise vortices.

24026 (CONF-9505100–1) **Microanalysis at atomic resolution.** Pennycook, S.J. (Oak Ridge National Lab., TN (United States). Solid State Div.); Jesson, D.E.; Browning, N.D.; Chisholm, M.F. Oak Ridge National Lab., TN (United States). [1995]. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 4. European workshop on modern developments and applications in microbeam analysis: microbeam and nanobeam techniques; Saint-Malo (France); 14-18 May 1995. Order Number DE95013040. Source: OSTI; NTIS; GPO Dep.

In this paper the authors discuss how the dedicated scanning transmission electron microscope can provide a microanalysis of crystalline materials at atomic resolution. The method requires the establishment of incoherent conditions for a reference imaging signal as well as the spectroscopic signal. The image can then be used to focus and locate the probe to atomic precision for microanalysis. The Z-contrast image provides the most convenient incoherent reference image, and X-ray and electron energy loss data may be acquired simultaneously. In zone axis crystals, strong columnar channeling delays the onset of beam broadening for several hundred Angstroms, so that atomic resolution microanalysis may be achieved in materials specimens of significant thickness. This combination of signals provides a powerful means for studying interface structure and bonding, and avoids relying on preconceived model structures.

24027 (DOE/CE/23810–62A) **Compatibility of R-245ca with motor materials under retrofit conditions.** Doerr, R.G.; Waite, T.D. Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States);Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States). DOE Contract FG02-91CE23810. (CONF-950624–2: Annual meeting of the American Society of Heating, Refrigeration and Air-Conditioning Engineers, Inc. (ASHRAE), San Diego, CA (United States), 24-28 Jun 1995). Order Number DE95015263. Source: OSTI; NTIS; GPO Dep.

This document, which is a reproduction of slides from a presentation at the June 1995 ASHRAE conference, evaluates and provides data on a number of motor parameters after the motor materials have been exposed to the refrigerant R-245ca. Data on conditions of the insulating varnish, the magnet wire, the insulations, and the elastomers are presented, as well as a note on work in progress. While it was concluded that most materials are compatible with R-245ca under retrofit conditions, it was also noted that the flammability, toxicity, efficiency, and cost of R-245ca and/or Blends are unresolved.

24028 (GKSS–94/E/60) **The GKSS test procedure for determining the fracture behaviour of materials: EFAM GTP 94.** Schwalbe, K.H. (GKSS-Forschungszentrum Geesthacht GmbH (Germany). Inst. fuer Werkstofforschung); Neale, B.K.; Heerens, J. GKSS-Forschungszentrum Geesthacht GmbH (Germnay). 1994. 111p. Order Number DE95777844. Source: OSTI; NTIS (US Sales Only).

This document describes a unified fracture mechanics test method in procedural form for quasi-static testing of materials. It is based on the ESIS Procedures P1 and P2 and introduces additional features, such as the δ_5 crack tip opening displacement, centre cracked tensile specimens, shallow cracks, "non-valid" CT and SENB specimen configurations, testing of weldments, and guidance for statistical treatment of scattered data. (orig.)

24029 (UCRL-ID–120930) **Terminal ballistic experiments for the development of turbine engine blade containment technology.** Gogolewski, R.P.; Cunningham, B.J. Lawrence Livermore National Lab., CA (United States). 25 Jan 1995. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95014164. Source: OSTI; NTIS; GPO Dep.

The ballistic experiments reported herein were conducted in three sets between October 1993 and November 1994. The first set of experiments examined the ballistic failure of annealed titanium plates. These experiments were performed in a manner consistent with earlier experiments conducted at United Technologies' Pratt and Whitney Division. The second set of experiments examined the ballistic performance of select aluminum and titanium alloys in single-plate and laminate form. In both sets of experiments, the failure modes of the targets were observed and catalogued. The third set of experiments evaluated underlying issues associated with geometric scaling. Blunt .30-and .50-caliber hard steel projectiles impacted on geometrically similar annealed titanium plates.

24030 (CONF-9504161–2) **Controlling cycle-by-cycle variation in a pulse combustor.** Daw, C.S. (Oak Ridge National Lab., TN (United States)); Thomas, J.F.; Rhode, M.A.; Rollins, R.W.; Markworth, A.J. Oak Ridge National Lab., TN (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States);Electric Power Research Inst., Palo Alto, CA (United States). DOE Contract AC05-84OR21400. Contract RP2426-25. From Central States/Western States Institute and American Flame Research committee meeting; San Antonio, TX (United States); 23-26 Apr 1995. Order Number DE95013209. Source: OSTI; NTIS; GPO Dep.

We describe a method for controlling chaos-generated cyclic variations in a pulse combustor. The method is applied to a recently developed thermal pulse combustor model and utilizes a map-based, adaptive proportional feedback algorithm. With this technique we show that it is possible to greatly reduce cycle-by-cycle pulse variation. We further show that minimizing cyclic variation allows combustor operation at conditions well beyond the normal flameout limit.

24031 (SAND–95-0008C) **Computational analysis of a three-dimensional High-Velocity Oxygen-Fuel (HVOF) Thermal Spray torch.** Hassan, B.; Lopez, A.R.; Oberkampf, W.L. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9509182–2: 1995 National thermal spray conference, Houston, TX (United States), 11-15 Sep 1995). Order Number DE95014994. Source: OSTI; NTIS; GPO Dep.

An analysis of a High-Velocity Oxygen-Fuel Thermal Spray torch is presented using computational fluid dynamics (CFD). Three-dimensional CFD results are presented for a curved aircap used for coating interior surfaces such as engine cylinder bores. The device analyzed is similar to the Metco Diamond Jet Rotating Wire torch, but wire feed is not simulated. To the authors' knowledge, these are the first published 3-D results of a thermal spray device. The feed gases are injected through an axisymmetric nozzle into the curved aircap. Argon is injected through the center of the nozzle. Pre-mixed propylene and oxygen are introduced from an annulus in the nozzle, while cooling air is injected between the nozzle and the interior wall of the aircap. The combustion process is modeled assuming instantaneous chemistry. A standard, two-equation, K-ε turbulence model is employed for the turbulent flow field. An implicit, iterative, finite volume numerical technique is used to solve the coupled conservation of mass, momentum, and energy equations for the gas in a sequential manner. Flow fields inside and outside the aircap are presented and discussed.

24032 (CONF-940702–1) **Measured and predicted cold load pickup and feeder parameter determination using the harmonic model algorithm.** Law, J. (Idaho Univ., Moscow, ID (United States)); Elliott, L.; Minford, D.; Storms, M. Idaho Univ., Moscow, ID (United States). [1994]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract BI79-92BP27938. From 1994 Institute of Electrical and Electronic Engineers/Power Engineering Society (IEEE/PES) summer meeting; San Francisco, CA (United States); 24-28 Jul 1994. Order Number DE95013069. Source: OSTI; NTIS; GPO Dep.

This paper presents theory of the "Cold Load Harmonic",CLHARM, model algorithm for simulation of power feeder currents resulting from both Cold Load STEPV method is also presented. Feeder parameters obtained from field STEPV measurement are used to predict CLPU on that feeder using the CHARM algorithm. STEPV test the same feeder are compared with computer predictions. The CLHARM aggregates feeder theormostatically controlled load to simulate regain of diversity during outage restoration. All feeder weather sensitive load is lumped in CLHARM, using mean parameter values of a simple theormodynamic model. The ultimate objective of this work is experimentally obtained feeder "signatures" for CLPU prediction as a feeder design tool.

24033 (CONF-951073–5) **A CMOS integrated circuit for pulse-shaped discrimination.** Frank, S.S.; Ericson, M.N.; Simpson, M.L.; Todd, R.A.; Hutchinson, D.P. Oak Ridge National Lab., TN (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From IEEE nuclear science symposium and medical imaging conference; San Francisco, CA (United States); 21-28 Oct 1995. Order Number DE95012877. Source: OSTI; NTIS; GPO Dep.

A CMOS integrated circuit (IC) for pulse-shape discrimination (PSD) has been developed. The IC performs discrimination of gamma-rays and neutrons as part of a system monitoring stored nuclear materials. The method implemented extracts the pulse tail decay time constant using a leading edge trigger for identifying the start of the pulse and a constant fraction discriminator (CFD) to determine the zero crossing of the shaped signal. The circuit is designed to interface with two photomultiplier tubes – one for pulse processing and one for coincidence detection. Two Outputs from the IC, a start and stop, can be used with a high speed timing system for pulse characterization with minimal external control. The circuit was fabricated in Orbit 1.2μm CMOS and operates from a 5-V supply. Specifics of the design including overall topology, charge sensitive preamplifier and CFD characteristics, shaping method and time constant selections, system timing, and implementation are discussed. Circuit performance is presented including dynamic range, timing walk, system dead time, and power consumption.

24034 (DOE/AL/98817–3) **Third quarterly report for TRP Flip Chip Attach.** International Business Machines Corp., Endicott, NY (United States). 25 Jul 1995. 45p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract FC04-94AL98817. Order Number DE95015512. Source: OSTI; NTIS; GPO Dep.

This report contains two separate reports for the Flip Chip Attach project. The first report is Yorktown's report as per their deliverable 1.6 on the rheological properties of the material. Since the paste dispensing process is preformed at shear rates above 100/s and in the low Reynolds's number, i.e., creeping flow regime, the authors have designed viscometry measurements to simulate the response under these conditions. The study determines simple parameters and criteria to obtain paste properties that may achieve high resolution dispensing. They compare and contrast their material with "the best in the business". They set forth a criteria for optimum screenability and demonstrate the high resolution dispensability of Yorktown pastes. Three Yorktown and two of the best commercial pastes are reported in this study. The second report documents a designed screening experiment to identify significant bonding variables. The bonding experiments were performed with the electrically conductive adhesive paste developed by Ravi, Saraf, and Sambucetti of the IBM Research Center at Yorktown Heights, NY. Eight bonding variables were incorporated in a two level factorial design with 16 trials. Palladium-nickel alloy plated copper coupons were used to simulate chips and substrates for this investigation. The shear tested chips were examined for fracture appearance characteristics. Only 11 of 46 chips displayed 50% or greater cohesive fracture. The most significant variables have been identified as bond pressure, temperature, and dwell time.

24035 (DOE/ER/45278–4) **[Structure and electronic properties of defects at nonlattice matched III-V semiconductor interfaces]. Progress report, 1989–90.** Ast, D.G. Cornell Univ., Ithaca, NY (United States). [1990]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER45278. Order Number DE95013303. Source: OSTI; NTIS; GPO Dep.

Research focused on control of misfit dislocations in strained epitaxial layers of GaAs through prepatterning of the substrate. Patterning and etching trenches into GaAs substrates before epitaxial growth results in nonplanar wafer surface, which makes device fabrication more difficult. Selective ion damaging the substrate prior to growth was investigated. The question of whether the overlayer must or must not be discontinuous was addressed. The third research direction was to extend results from molecular beam epitaxially grown material to organometallic chemical vapor deposition. Effort was increased to study the patterning processes and the damage it introduces into the substrate. The research program was initiated after the discovery that 500-eV dry etching in GaAs damages the substrate much deeper than the ion range.

24036 (DOE/R7/01314–T7) **Novel method for making semiconductor chips. Seventh quarterly and final report, January 7, 1995–May 7, 1995.** Welch (James D.), Omaha, NE (United States). [1995]. 291p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG47-93R701314. Order Number DE95014927. Source: OSTI; NTIS; GPO Dep.

Work under DOE Grant No. DE-FG47-93R701314, to investigate a Novel Process for Fabricating MOSFET Devices, has progressed to a point where feasibility of producing MOSFETS using Chromium Disilicide Schottky barrier junctions at Source and Drain has been shown. Devices fabricated, however, show inconsistent operating characteristics from device to device, and further work is required to overcome the defects. Some fabrication procedures have produced a relatively high, (e.g., ninety-five (95%) percent), yield of devices on a substrate which show at least some transistor action, while others have resulted in very low yield, (e.g., five (5%) percent). Consistency of results from device to device is less than desired. However, considering that the University of Nebraska at Lincoln (UNL) Electrical Engineering Fabrication Lab is not what industry can provide, it is reasonable to project that essentially one-hundred (99.99+%) percent yield should be achievable in an industrial setting because of the simplicity in the fabrication procedure.

24037 (LA–12901-PR) **AGEX II: Technical quarterly, Volume 2.** Ekdahl, C. (comp.). Los Alamos National Lab., NM (United States). Mar 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95012120. Source: OSTI; NTIS; GPO Dep.

The AGEX II Technical Quarterly publishes short technical contributions on above ground experiments that use pulsed power and laser drivers. The Quarterly is intended to provide rapid exposure of timely technical ideas and results as well as a means for documenting AGEX II progress and scientific quality for the AGEX II community. Suitable topics include experimental results, diagnostic apparatus, theoretical design, and scaling, among others.

24038 (LBL-PUB–754, pp. 101-115) **Harmonic generation with multiple wiggler schemes.** Bonifacio, R. (Universita degli Studi, Milano (Italy)); De Salvo, L.; Pierini, P. Lawrence Berkeley Lab., CA (United States). Feb 1995. In *The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.* 202p. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper the authors give a simple theoretical description of the basic physics of the single pass high gain free electron laser (FEL), describing in some detail the FEL bunching properties and the harmonic generation technique with a multiple-wiggler scheme or a high gain optical klystron configuration.

24039 (LBL-PUB–754, pp. 183-190) **Powerful electrostatic FEL: Regime of operation, recovery of the spent electron beam and high voltage generator.** Boscolo, I. (Univ. and INFN, Milan (Italy)); Gong, J. Lawrence Berkeley Lab., CA (United States). Feb 1995. In *The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.* 202p. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

FEL, driven by a Cockcroft-Walton electrostatic accelerator with the recovery of the spent electron beam, is proposed as powerful radiation source for plasma heating. The low gain and high gain regimes are compared in view of the recovery problem and the high gain regime is shown to be much more favourable. A new design of the onion Cockcroft-Walton is presented.

24040 (LNF-IR–95-014) **KLOE data acquisition system: Addendum to KLOE technical proposal.** KLOE Collaboration. KLOE Collaboration. Apr 1995. 58p. Order Number DE95789749. Source: OSTI; NTIS (US Sales Only).

The report presents the desing of the KLOE data acquisition system and includes the philosophy and extensive discussions on all parts of the system.

24041 (SAND–94-2593C) **Effects of pre-stressing and flux on the flow of solder on PWB copper surfaces.** Hernandez, C.L.; Hosking, F.M. Sandia National Labs., Albuquerque, NM (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9506182–2: NEPCON East '95, Boston, MA (United States), 12-15 Jun 1995). Order Number DE95011599. Source: OSTI; NTIS; GPO Dep.

A variety of test methods are available to evaluate the solderability of printed wiring board [PWB] surface finishes. A new test has been developed which better simulates the capillary flow physics of typical solder assembly processing, especially surface mount soldering. The work was conducted under a cooperative research and development agreement between Sandia National Laboratories, the National Center for Manufacturing Sciences, and several PWB fabricators (AT&T, IBM, Texas Instruments, and United Technologies Corporation/Hamilton Standard) to advance PWB interconnect systems technology. Particular attention has been given at Sandia to characterizing the effects of accelerated aging in a simulated indoor industrial environment on subsequent PWB solderability. The program's baseline surface finish was copper. Solderability testing on "as-fabricated" and "pre-stressed copper" pad-strip geometries was performed with Sn-Pb eutectic solder and three different fluxes at four different reflow temperatures.

24042 (SAND–95-0913) **An optically-triggered semiconductor switch for high power laser beams.** Chow, Weng W.; Warren, M.E. Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95013885. Source: OSTI; NTIS; GPO Dep.

The work involves research leading to an optically triggered switch for a high power laser pulse. The switch uses a semiconductor heterostructure whose optical properties are modified by a low power laser trigger such as a laser diode. Potential applications include optical control of pulsed power systems, control of medical lasers and implementation of security features in optical warhead architectures.

24043 (SAND–95-1040) **A one piece wall box for space electronics.** Greenwood, W.H. Sandia National Labs., Albuquerque, NM (United States). May 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95014490. Source: OSTI; NTIS; GPO Dep.

In extraterrestrial applications, satellite payloads have printed circuit modules that are housed in boxes or chassis. The box may be a one piece wall or a segmented wall. These two wall options are compared for function and cost.

24044 (SAND–95-1165C) **Transformer design considerations for non-continuous mode, boost, flyback converters.** Nagel, R. Sandia National Labs., Albuquerque, NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950987–1: Electrical/electronics insulation conference, Chicago, IL (United States), 18-21 Sep 1995). Order Number DE95013830. Source: OSTI; NTIS; GPO Dep.

This paper presents some design considerations for small, flyback transformers used to charge energy storage capacitors to 0.1 to 5 KV from a low voltage DC source.

24045 (SAND–95-1374C) **$La_{0.5}Sr_{0.5}CoO_3$ electrode technology for Pb(Zr, Ti)O_3 thin film nonvolatile memories.** Tuttle, B.A.; Al-Shareef, H.N.; Warren, W.L.; Raymond, M.V.; Headley, T.J.; Voigt, J.A. Sandia National Labs., Albuquerque, NM (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950728–1: 1. European meeting on integrated ferroelectricity, Nijmegen (Netherlands), 4-8 Jul 1995). Order Number DE95014863. Source: OSTI; NTIS; GPO Dep.

Oxide electrode technology is investigated for optimization of Pb(Zr,Ti)O_3 (PZT) thin film capacitor properties for high density nonvolatile memory applications. PZT thin film capacitors with RF sputter deposited $La_{0.5}Sr_{0.5}CoO_3$ (LSCO) electrodes have been characterized with respect to the following parameters: initial dielectric hysteresis loop characteristics, fatigue performance, microstructure and imprint behavior. Our studies have determined that the fatigue of PZT capacitors with LSCO electrodes is less sensitive to B site cation ratio and underlying electrode stack technology than with RuO_2 electrodes. Doping PZT thin films with Nb (PNZT) improves imprint behavior of LSCO//PZT//LSCO capacitors considerably. We have demonstrated that PNZT 4/30/70 //LSCO capacitors thermally processed at either 550°C or 675°C have almost identical initial hysteresis properties and exhibit essentially no fatigue out to approximately 10^{10} cycles.

24046 (SAND–95-1425C) **Composition analysis of ECR-grown SiO_2 and SiO_xF_y films.** Burkhart, J.H. (Idaho State Univ., Pocatello, ID (United States)); Denison, D.; Barbour, J.C.; Apblett, C.A. Sandia National Labs., Albuquerque, NM (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9505122–1: International conference on ion beam analysis, Tempe, AZ (United States), 22-26 May 1995). Order Number DE95014860. Source: OSTI; NTIS; GPO Dep.

The Office of integrated Analysis and Forecasting (OIAF) is required to provide complete model documentation to meet the EIA Model Acceptance Standards. The Model Documentation for the Electricity Market Module (EMM) provides a complete description of the EMM methodology, structure, and relation to other modules in the National Energy Modeling System (NEMS). This Model Developers Report (MDR) serves as an appendix to the methodology documentation. The MDR provides an assessment of the sensitivity of the EMM results to changes in input data or parameters.

24047 (SAND–95-8550C) **Extreme Ultraviolet Lithography with laser plasma sources.** Kubiak, G.D.; Tichenor, D.A.; Stulen, R.H. Sandia National Labs., Livermore, CA (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9507122–2: CLEO/Pacific Rim coal conference, Makuhar (Japan), 11-14 Jul 1995). Order Number DE95010753. Source: OSTI; NTIS; GPO Dep.

Extreme Ultraviolet Lithography (EUVL) is being developed for the fabrication of integrated circuits having dimensions of $\leq$ 0.13 μm. The development and use of high-power, low-debris laser-produced plasma sources of 11–14 nm radiation for this application will be described.

24048 (UCRL-ID–118502) **Small-business technology transfer program, case number 93119 - second harmonic generation for Lee Laser Inc.: Resonator designs.** Erbert, G.V.

Lawrence Livermore National Lab., CA (United States). 2 Sep 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015378. Source: OSTI; NTIS; GPO Dep.

The author has investigated several resonator designs for Lee Laser Inc. as outlined in the Short-Term Technical Assistance Project, case number 93119. The scope of this work was to identify various resonator options which would be suitable for use in an intra-cavity doubled Nd:YAG laser and compatible with Lee Laser hardware. This work consisted of computer modeling of laser resonators to identify mirror curvatures, distances, beam sizes, and sensitivity to thermal loading of the laser rod.

24049 (UCRL-ID–118749) **DEWPOINT. Final report.** Riddle, R.A. Lawrence Livermore National Lab., CA (United States). Sep 1994. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95011758. Source: OSTI; NTIS; GPO Dep.

The DEWPOINT (Directed Energy POwer INTegration) program was aimed at providing the large amounts of electric power required for a laser or accelerator based in space, or on an aircraft or satellite platform. This is our final report on our efforts as a part of this program which was cancelled before completion. This report summarizes the entire scope of effort funded by this program. It also includes some related information on cryogenically cooled microchannel heatsinks which was funded internally by LLNL. Specifically, the DEWPOINT program was to provide the electrical power for the proposed Neutral Particle Beam weapon system of the Strategic Defense Initiative. The Neutral Particle Beam called for a space-based accelerator driven by radio frequency power sources. The radio frequency solid-state power amplifiers generate waste heat which must be dissipated.

24050 (UCRL-JC–117006) **Theory of recombination x-ray lasers based on optical-field ionization.** Eder, D.C. (Lawrence Livermore National Lab., CA (United States)); Amendt, P.; DaSilva, L.B.; London, R.A.; Rosen, M.D.; Wilks, S.C.; Donnelly, T.D.; Falcone, R.W. Lawrence Livermore National Lab., CA (United States). Dec 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940592–14: 4. international colloquium on X-ray lasers, Williamsburg, VA (United States), 16-20 May 1994). Order Number DE95015031. Source: OSTI; NTIS; GPO Dep.

Ultrashort-pulse, high-intensity laser drivers have the potential for creating tabletop-size x-ray lasers by ionizing the target gas via the electric field of the laser pulse. For appropriate plasma conditions following ionization, lasing can occur during the subsequent rapid recombination. A review of the theory and modeling for these optical-field-ionized x-ray lasers is presented. Particular attention is given to the issues of electron beating and ionization-induced refraction. We summarize modeling in support of experiments where evidence of lasing in H-like Li at 135 Å was obtained. In addition, we present modeling results for lasing in Li-like N at 247 Å. We briefly discuss new applications appropriate for tabletop-size high-repetition-rate x-ray lasers.

24051 (UCRL-JC–118120) **Laser properties of an improved average-power Nd-doped phosphate glass.** Payne, S.A. (and others); Marshall, C.D.; Bayramian, A.J. Lawrence Livermore National Lab., CA (United States). 15 Mar 1995. 11p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940723–43: Annual meeting of the Society of Photo-Optical Instrumentation Engineers, San Diego, CA (United States), 24-29 Jul 1994). Order Number DE95014366. Source: OSTI; NTIS; INIS; GPO Dep.

The Nd-doped phosphate laser glass described herein can withstand 2.3 times greater thermal loading without fracture, compared to APG-1 (commercially-available average-power glass from Schott Glass Technologies). The enhanced thermal loading capability is established on the basis of the intrinsic thermomechanical properties (expansion, conduction, fracture toughness, and Young's modulus), and by direct thermally-induced fracture experiments using Ar-ion laser heating of the samples. This Nd-doped phosphate glass (referred to as APG-t) is found to be characterized by a 29% lower gain cross section and a 25% longer low-concentration emission lifetime.

24052 (UCRL-JC–118186) **New diode wavelengths for pumping solid-state lasers.** Skidmore, J.A. (and others); Emanuel, M.A.; Beach, R.J. Lawrence Livermore National Lab., CA (United States). Jan 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950226–55: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-14 Feb 1995). Order Number DE95014684. Source: OSTI; NTIS; GPO Dep.

High-power laser-diode arrays have been demonstrated to be viable pump sources for solid-state lasers. The diode bars (fill factor of 0.7) were bonded to silicon microchannel heatsinks for high-average-power operation. Over 12 W of CW output power was achieved from a one cm AlGaInP tensile-strained single-quantum-well laser diode bar. At 690 nm, a compressively-strained single-quantum-well laser-diode array produced 360 W/cm^2 per emitting aperture under CW operation, and 2.85 kW of pulsed power from a 3.8 cm^2 emitting-aperture array. InGaAs strained single-quantum-well laser diodes emitting at 900 nm produced 2.8 kW pulsed power from a 4.4 cm^2 emitting-aperture array.

24053 (UCRL-JC–119257) **Applications of microlens-conditioned laser diode arrays.** Beach, R.J. (and others); Emanuel, M.A.; Freitas, B.L. Lawrence Livermore National Lab., CA (United States). Jan 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950226–53: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-14 Feb 1995). Order Number DE95014158. Source: OSTI; NTIS; GPO Dep.

The ability to condition the radiance of laser diodes using shaped-fiber cylindrical-microlens technology has dramatically increased the number of applications that can be practically engaged by diode laser arrays. Lawrence Livermore National Laboratory (LLNL) has actively pursued optical efficiency and engineering improvements in this technology in an effort to supply large radiance-conditioned laser diode array sources for its own internal programs. This effort has centered on the development of a modular integrated laser diode packaging technology with the goal of enabling the simple and flexible construction of high average power, high density, two-dimensional arrays with integrated cylindrical microlenses. Within LLNL, the principal applications of microlens-conditioned laser diode arrays are as high intensity pump sources for diode pumped solid state lasers (DPSSLs). A simple end-pumping architecture has been developed and demonstrated that allows the radiation from microlens-conditioned, two-dimensional diode array apertures to be efficiently delivered to the end of rod lasers. To date, pump powers as high as 2.5 kW have been delivered to 3 mm diameter laser rods. Such high power levels are critical for pumping solid state lasers in which the terminal laser level is a Stark level lying in the ground state manifold. Previously, such systems have often required operation of the solid state gain medium at low temperature to freeze out the terminal laser Stark level population. The authors recently developed high intensity pump sources overcome this difficulty by effectively pumping to much higher inversion levels, allowing efficient operation at or near room temperature. Because the end-pumping technology is scalable in absolute power, the number of rare-earth ions and transitions that can be effectively accessed for use in practical DPSSL systems has grown tremendously.

24054 (UCRL-JC–119611) **Amplification of femtosecond pulses to above 1 J with large aperture Cr:LiSrAlF$_6$ amplifiers.** Ditmire, T.; Perry, M.D. Lawrence Livermore National Lab., CA (United States). Jan 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950226–54: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-14 Feb 1995). Order Number DE95014678. Source: OSTI; NTIS; GPO Dep.

The authors have developed a chirped pulse amplification system capable of producing femtosecond pulses with energy above

one joule. This is accomplished by using a large aperture, flashlamp pumped Cr-LiSrAlF$_6$ (Cr:LiSAF) amplifier. Optimum design of the 19 mm diameter amplifier results in a single pass gain of 5 with good beam quality. This amplifier produces 1.05 J pulses after compression with a width of < 125 fs at a repetition rate of 0.05 Hz.

24055 (UCRL-JC–119626) **EUV lithography cost of ownership analysis.** Hawryluk, A.M.; Ceglio, N.M. Lawrence Livermore National Lab., CA (United States). 19 Jan 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9409177–9: Optical Society of America conference on extreme ultraviolet lithography, Monterey, CA (United States), 19-21 Sep 1994). Order Number DE95014675. Source: OSTI; NTIS; GPO Dep.

The cost of fabricating state-of-the-art integrated circuits (ICs) has been increasing and it will likely be economic rather than technical factors that ultimately limit the progress of ICs toward smaller devices. It is estimated that lithography currently accounts for approximately one-third the total cost of fabricating modern ICs([1]). It is expected that this factor will be fairly stable for the forseeable future, and as a result, any lithographic process must be cost-effective before it can be considered for production. Additionally, the capital equipment cost for a new fabrication facility is growing at an exponential rate (2); it will soon require a multibillion dollar investment in capital equipment alone to build a manufacturing facility. In this regard, it is vital that any advanced lithography candidate justify itself on the basis of cost effectiveness. EUV lithography is no exception and close attention to issues of wafer fabrication costs have been a hallmark of its early history. To date, two prior cost analyses have been conducted for EUV lithography (formerly called "Soft X-ray Projection Lithography"). The analysis by Ceglio, et. al., provided a preliminary system design, set performance specifications and identified critical technical issues for cost control. A follow-on analysis by Early, et.al., studied the impact of issues such as step time, stepper overhead, tool utilization, escalating photoresist costs and limited reticle usage on wafer exposure costs. This current study provides updated system designs and specifications and their impact on wafer exposure costs. In addition, it takes a first cut at a preliminary schematic of an EUVL fabrication facility along with an estimate of the capital equipment costs for such a facility.

24056 (UCRL-JC–119629) **Coating strategy for enhancing illumination uniformity in a lithographic condenser.** Gaines, D.P.; Vernon, S.P.; Sommargren, G.E.; Kania, D.R. Lawrence Livermore National Lab., CA (United States). 26 Jan 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9409177–8: Optical Society of America conference on extreme ultraviolet lithography, Monterey, CA (United States), 19-21 Sep 1994). Order Number DE95014371. Source: OSTI; NTIS; INIS; GPO Dep.

A three-element Koehler condenser system has been fabricated, characterized, and integrated into an EUV lithographic system. The multilayer coatings deposited on the optics were designed to provide optimal radiation transport efficiency and illumination uniformity. Extensive EUV characterization measurements performed on the individual optics and follow-on system measurements indicated that the condenser was operating close to design goals. Multilayer d-spacings were within 0.05 nm of specifications, and reflectances were approximately 60%. Illumination uniformity was better than ±10%. The broadband transport efficiency was 11%.

24057 (UCRL-JC–119634) **Critical illumination condenser for extreme ultraviolet projection lithography.** Cohen, S.J.; Seppala, L.G. Lawrence Livermore National Lab., CA (United States). 2 Mar 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9409177–16: Optical Society of America conference on extreme ultraviolet lithography, Monterey, CA (United States), 19-21 Sep 1994). Order Number DE95014683. Source: OSTI; NTIS; GPO Dep.

A condenser system couples a radiation source to an imaging system. The authors have designed a critical illumination condenser system which meets the technical challenges of extreme ultraviolet projection lithography based on a ring field imaging system and a laser produced plasma source. The optical system, a three spherical mirror optical design, is capable of illuminating the extent of the mask plane by scanning either the primary mirror or the laser plasma source. This type of condenser optical design is sufficiently versatile to be employed with two distinct systems, one from Lawrence Livermore National Laboratory and one from AT and T/Sandia.

24058 (UCRL-JC–119725) **Copper electroplating process for sub-half-micron ULSI structures.** Contolini, R.J. (Lawrence Livermore National Lab., CA (United States)); Tarte, L.; Graff, R.T.; Evans, L.B.; Cox, J.N.; Puich, M.R.; Gee, J.D.; Mu, Xiao-Chun; Chiang, Chien. Lawrence Livermore National Lab., CA (United States). 15 May 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9506206–1: Very large scale integration multilevel interconnection conference, Santa Clara, CA (United States), 27-28 Jun 1995). Order Number DE95014674. Source: OSTI; NTIS; GPO Dep.

We have utilized electroplating technology in a damascene process to produce low resistance copper interconnects in sub-half-micron ULSI patterns having aspect ratios of 2.4:1. The use of a pulsed-voltage plating technique allows trench filling capability without voids. Samples of 150 mm diameter were patterned and sputtered with a barrier layer, followed by a copper seed layer. Pulsed-voltage electroplating, deposited about 2 microns of copper uniformly (1 sigma < 5%) over the surface. The electroplated copper has low levels of impurities, excellent adhesion, excellent step coverage, and rates comparable to other deposition methods. We present details of the electroplating equipment, and data on the filling characteristics of the copper metallization which prevent void formation and reduce contact resistance.

24061 (ANL/ASD/CP–85045) **Commissioning software tools at the Advanced Photon Source.** Emery, L. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–233: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013751. Source: OSTI; NTIS; INIS; GPO Dep.

A software tool-oriented approach has been adopted in the commissioning of the Advanced Photon Source (APS) at Argonne National Laboratory, particularly in the commissioning of the Positron Accumulator Ring (PAR). The general philosophy is to decompose a complicated procedure involving measurement, data processing, and control into a series of simpler steps, each accomplished by a generic toolkit program. The implementation is greatly facilitated by adopting the SDDS (self-describing data set protocol),

which comes with its own toolkit. The combined toolkit has made accelerator physics measurements easier. For instance, the measurement of the optical functions of the PAR and the beamlines connected to it have been largely automated. Complicated measurements are feasible with a combination of tools running independently.

24062 (ANL/ED/CP–86766) **A hard x-ray micro-analytical beamline at the CAMD synchrotron.** Petri, M.C. (Argonne National Lab., IL (United States)); Leibowitz, L.; Schilling, P. Argonne National Lab., IL (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950793–2: 40. annual meeting of the Society of Photo-Optical Instrumentation Engineers: international symposium on optical science, engineering and instrumentation, San Diego, CA (United States), 9-14 Jul 1995). Order Number DE95014232. Source: OSTI; NTIS; GPO Dep.

Argonne National Laboratory (ANL) is collaborating with Louisiana State University (LSU) in constructing a synchrotron x-ray micro-analytical beamline at the Center for Advanced Microstructures and Devices (CAMD) in Baton Rouge. This project grew from earlier work at the National Synchrotron Light Source (NSLS), where a team of ANL researchers developed techniques to examine small-scale structures in diffusion zones of a variety of materials. The ANL/CAMD beamline will use x-ray fluorescence, diffraction, and absorption spectroscopy techniques to reveal both compositional and structural information on a microscopic scale.

24063 (BNL–61222) **Alignment and survey of the elements in RHIC.** Trbojevic, D. (and others); Cameron, P.; Ganetis, G.L. Brookhaven National Lab., Upton, NY (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950512–128: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011804. Source: OSTI; NTIS; GPO Dep.

The Relativistic Heavy Ion Collider (RHIC) consists of two rings with cryogenic magnets at a 4.5K operating temperature. Control of positions of the dipole and quadrupole cold masses (iron laminations) and the beam position monitors (BPM's) during production and installation is presented. The roll of the dipoles is controlled by a combination of rotating coil measurements with the surveying measurements. The center of the quadrupole magnetic field is obtained by direct measurement of the field shape within a colloidal cell placed inside the quadrupoles. Special attention is given to the triplet quadrupole alignment and determination of the field center position.

24064 (BNL–61876) **Gas breakdown limits for inverse Cherenkov laser accelerators.** Liu, Y. (California Univ., Los Angeles, CA (United States). Dept. of Physics); Pogorelsky, I.V. Brookhaven National Lab., Upton, NY (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95015367. Source: OSTI; NTIS; INIS; GPO Dep.

The probability of avalanche, tunneling and multiphoton ionization induced by a CO_2 laser in H_2 gas has been calculated. Laser light screening by a self-induced plasma density gradient is considered as the limiting factor for upscaling a CO_2 laser-driven Inverse Cherenkov Laser Accelerator beyond 650 MeV/m. However, in near-resonance inverse Cherenkov acceleration where a shorter wavelength laser is used at a wavelength near the resonance of the gas (e.g. 248nm in H_2), the formation of a plasma is not a problem because the plasma density is below the critical density. In that case, the laser beam propagates unaffected through the plasma and the acceleration gradient is not limited by gas breakdown. Gradients > 1 GeV/m are possible.

24065 (DOE/EA–0848) **Construction and operation of a 10 MeV electron accelerator and associated experimental facilities at Brookhaven National Laboratory, Upton, New York. Environmental assessment.** USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Feb 1994. 20p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012128. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this environmental impact statement is to determine whether there would be significant environmental impacts associated with the construction of an experimental facility at Brookhaven National Laboratory for radiation chemistry research and operation of the 10-MeV electron accelerator proposed for it. The document describes the need for action, alternative actions, the affected environment, and potential environmental impacts.

24066 (JINR-D–9-92-455) **Proceedings of the 13. workshop on charged particle accelerators. Volume 1.** Vasil'ev, A.A. (ed.). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The present status of charged particle accelerators and storage rings is considered. The new acceleration techniques are described and possible ways of their realization are shown. A lot of papers are devoted to the consideration of two-beam ion acceleration method.

24067 (JINR-D–9-92-455, pp. 30-35) **25 years of operation of the LUEh-2000 Kharkov linac for physical programs.** Akchurin, Yu.I. (Khar'kovskij Fiziko-Tekhnicheskij Inst, Kharkov (Ukraine)); Beloglazov, V.I.; Biller, E.Z. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Present status of the LUEh-2000 Kharkov electron linac is described. Accelerator operated for different physical programs without modification and repair. Accelerator parameters were improved at the expanse of modification of separate systems. More than 100 thousand hours accelerator operated for experimental programs during the period from 1966. Electron beam parameters obtained in 1966 and 1990 are given. Aiming at the construction of the pulse-stretcher obtaining quasi continuous electron beams and developing polarized electron sources plans for the accelerator modifications are described. 5 refs., 2 tabs., 3 figs.

24068 (JINR-D–9-92-455, pp. 36-42) **Free electron laser for the 2 x 1 TeV photon collider.** Sarantsev, V.P. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Yurkov, M.V.; Saldin, E.L.; Shnejdmiller, E.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The two-cascade scheme of a free electron laser (FEL) of the 2 x 1 TeV photon collider is suggested. The FEL-generator having peak power of $\approx$ 10 MW which is amplified up to 5 x 10^{11} W in the FEL-amplifier with variable parameters is used as a driving laser. Requirements for parameters of electron beam and the FEL-amplifier magnetic system are formulated on the base of calculations. 19 refs., 2 tabs., 4 figs.

24069 (JINR-D–9-92-455, pp. 107-111) **Present status of the nuclotron.** Averichev, S.A. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Agapov, N.N.; Baldin, A.M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Present status of the construction of the JINR nuclotron-synchrotron designed for acceleration of nuclei up to 6 GeV/nucleon is described. Nuclotron magnetic system test results are presented. The pressure in the accelerator vacuum chamber attained less than 10^{-9} Torr. The injection of 6 MeV/nucleon polarized deuteron beam having the intensity of 2 x 10^9 particles per pulse at the let of the ring have been performed. 4 refs., 1 tab., 2 figs.

24070 (JINR-D–9-92-455, pp. 118-121) **Modification of the UKP-2-1 heavy ion charge accelerator.** Arzumanov, A.A. (Akademiya Nauk Respubliki Kazakhstan, Inst Yadernoj fiziki,

Alma-Ata (Kazakhstan)); Borisenko, A.N.; Gorlachev, I.D.; Lysukhin, S.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224--: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Results of the modification of the UKP-2-1 tandem heavy ion accelerator are presented. High-voltage power supply stability and improvement of the beam injection system are the main directions of modification. Experimental results of measuring thin films by means of resonance nuclear reactions and the study on proton beam channeling in tungsten monocrystal are given. 3 refs., 1 tab., 6 figs.

24071 (JINR-D--9-92-455, pp. 122-125) **Acceleration of heavy ion beams at the IYaF AN RK cyclotron.** Arzumanov, A.A. (Akademiya Nauk Respubliki Kazakhstan, Inst Yadernoj fiziki, Alma-Ata (Kazakhstan)); Batishchev, V.N.; Gerasimov, V.I.; Gor'kovets, M.S. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224--: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Results of experiments of heavy ion beams acceleration at the third harmonic of RF accelerating voltage in the isochronous cyclotron with energy coefficient of K = 50 and with application of the direct-heated Penning ion source having arc pulse supply and enhanced anode voltage are presented. Two-, three- and four-charge internal beams of carbon, nitrogen and oxygen ions having the intensity of 1 - 13 μA ion phase motion and the formation of acceleration regimes to provide optimal extraction of ions are considered. 5 refs., 3 figs.

24072 (JINR-D--9-92-455, pp. 126-130) **Adjustment of the UK - auxiliary magnetic ring of the ITEP accelerating complex.** Alekseev, N.N. (Inst Teoreticheskoj i Ehksperimental'noj Fiziki, Moscow (Russian Federation)); Bol'shakov, A.E.; Gaponenko, S.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224--: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Results of alignment and testing an auxiliary magnetic ring (MR) which is a booster synchrotron for the ITEP U-10 proton synchrotron are presented. The MR structure has 21 period. Each period has a six-meter rectilinear gap. Experiments with circulating beam showed the possibility of obtaining circulating beam current of several tens of μA in the vicinity of operation point. 1 ref., 1 tab., 3 figs.

24073 (JINR-D--9-92-455, pp. 134-141) **Project of a heavy accelerating complex.** Kukhtin, V.P. (Nauchno-Issledovatel'skij Inst Ehlektrofizicheskoj Apparatury im. D.V.Efremova, Sankt-Peterburg (Russian Federation)); Kozienko, M.T.; Lamzin, E.A.; Rozhdestvenskij, B.V.; Severgin, Yu.P.; Smirnov, Yu.V.; Solames, A.A.; Shukejlo, I.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224--: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

An accelerating complex based on two cyclotrons and the Ecr-ion source designed for the production of 6.5 MeV/nucleon heavy ions (which is equivalent to Coulomb barrier) is suggested. Comparatively small size, weight and power supply are attained at the expense of specific energy gain at the outlet in spite of the type of accelerated particles. Accelerating complex is an individual module and may be used in the structure with large accelerating accelerating complexes like Moscow Meson Factory, TRIUMF (Canada) and so on. The given accelerating complex may be used for the acceleration of both radioactive and stable ions. 2 tabs., 6 figs.

24074 (JINR-D--9-92-455, pp. 147-149) **Status of construction of the Kurchatov institute MGTs-10 small-sized cyclotron.** Burbeza, K.D. (Rossijskij Nauchnyj Tsentr 'Kurchatovskij Inst', Moscow (Russian Federation)); Vasil'ev, A.A.; Venikov, N.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224--: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Status of the construction of the MGTs-10 isochronous cyclotron designed for joint operation with a positron emission-tomography center and for the production of ^{11}C, ^{13}N, ^{15}O and ^{18}F ultrashort-lived radionuclides is described. The greater part of magnetic system elements have been manufactured and the on-line system designed for magnetic field measurement has been constructed. Cyclotron vacuum chamber tests have been performed. 3 figs., 2 figs.

24075 (JINR-D--9-92-455, pp. 156-160) **Electrodynamic characteristics of accelerating structure of the Moscow meson factory radionuclide linear accelerator (LURAN).** Bomko, B.A. (UNTs Khar'kovskogo Fiziko-Tekhnicheskogo Instituta, Kharkov (Ukraine)); D'yachenko, A.F.; Kobets, A.F.; Rudyak, B.I.; Vyalov, G.N.; Ostroumov, P.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224--: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Calculation results and experimental study on electrodynamic characteristics of the continuous action linear accelerator designed for the production, separation and post acceleration of radionuclides for the Moscow Meson Factory are presented. Investigations have been performed at the functional model of a 5-sectional rod-loaded mass-to-charge ratio of ions accelerating structure with initial equalling to 60. 2 refs., 4 figs.

24076 (JINR-D--9-92-455, pp. 161-163) **Method of radioactive nuclei acceleration using one accelerator.** Dem'yanov, A.V. (Akademiya Nauk Ukrainy, Inst Yadernykh Issledovanij, Kiev (Ukraine)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224--: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The scheme designed for acceleration of radioactive nuclei using one accelerator is suggested. The scheme comprises the following main elements: an external multicharged ion source of nonradiative atoms, a beam bending magnet, an ion axial injection system, a heavy ion accelerator, an electrostatic analyzer, an external injector of high-charge separated ions of radioactive atoms, a magnetic separator and a bending magnet for beam injection into an accelerator. 2 refs., 2 figs.

24077 (JINR-D--9-92-455, pp. 164-166) **Multicharged ion beam production with a narrow energy spectra in the regime of particle final energy variation.** Kolyaskin, A.D. (Moskovskij Inzhenerno-Fizicheskij Inst., Moscow (Russian Federation)); Val'dner, O.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224--: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The possibility of the production of charged particle accelerated beams with a narrow energy spectra at the tandem - RF linear multi sectional post accelerator complexes is investigated. It is shown, that this problem can be solved using beam emittance matching with a longitudinal acceptance of a post accelerator channel. 1 ref., 1 tab., 1 fig.

frequency. Belov, V.P. (Nauchno-Issledovatel'skij Inst Ehlektrofizicheskoj Apparatury im. D.V.Efremova, Sankt-Peterburg (Russian Federation)); Severgin, Yu.P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224--: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The method of ion acceleration up to the energy of > 100 MeV/m at the RF electric field constant frequency in the synchrotrons is suggested. In the given method, ion acceleration is provided at high repetition rate and the RF field constant frequency and RF voltage changes according to the law of particles arriving to the new neighbouring separatrix every each cycle. Thus, higher repetition rate of acceleration is attained, no frequency tuning is required and the RF-stations have small overall dimensions. 1 ref.

Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224--: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The construction of the 175 MeV continuous action racetrack microtron with average beam current of 100 μA is under way at the Institute for Nuclear Physics of the Moscow University. The main accelerator components have been produced. Physical start up of the injector designed for the energy of 6.2 MeV and maximum beam current of 1 mA was performed. The biperiodic accelerating structure with internal coupling cells is used in the linear accelerator. 1 tab., 3 figs.

24080 (JINR-D--9-92-455, pp. 191-194) **Methods of minimization of frequency shift in accelerating structures at power input into an accelerator.** Tiunov, A.V. (Moskovskij Gosudarstvennyj Univ., Moscow (Russian Federation). Nauchno-Issledovatel'skij Inst. Yadernoj Fiziki); Shvedunov, V.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224--: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Two methods of the frequency shift in accelerating structures with internal coupling cells at a power input into the accelerator are considered. High distributed cooling system is used in the first method. The purposeful variation of the deformation character of the structure at the expense of using bimetallic structures on the base of copper and molybdenum is used in the second method. 4 refs., 1 tab., 1 fig.

Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The relationship between efficiencies of ponderomotive and thermoelasticity nonlinear mechanisms of ultrasound excitation by a pulse electromagnetic microwave field is determined. Electromagnetic field -acoustic field coupling due to the strong external magnetic field in conducting structures is considered. The effect of skin layer acoustic motion on the surface impedance of metallic walls of electrodynamic structures is investigated. 3 refs.

24083 (JINR-D--9-92-455, pp. 274-276) **RF-power recuperation system of the final part of Kharkov large accelerator for material sciences.** Lobzov, L.D. (UNTs Khar'kovskogo Fiziko-Tekhnicheskogo Instituta, Kharkov (Ukraine)); Mazalov, Yu.P.; Khizhnyak, N.A.; Shulika, N.G.; Grebenyuk, S.V.; Prudkij, V.P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224--: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The description of the RF power recuperation system of the output of the ion accelerator designed for material sciences is presented. The scheme of a travelling wave resonator with recuperation chains is given. The basic element of the resonator ring is a tunable coupler. The resonator ring comprises elements of tuning and control of resonator parameter mode. Movable short-circuit stubs provide the reflection compensation in the resonator. The major parameters of the resonator are presented. 5 refs., 1 tab., 1 fig.

24084 (JINR-D--9-92-455, pp. 282-284) **Hybrid plasma slowing-down structures for linear accelerators.** Karbushev, N.I. (Moskovskij Radiotekhnicheskij Inst, Moscow (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224--: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The possibility of the improvement of linear accelerator characteristics by means of a high-frequency slowing-down structure channel filling with a plasma is considered. The presence of a plasma may lead to the increase of electric field wave longitudinal component amplitude and the following increase of maximum accelerating rate is shown. 19 refs., 2 figs.

24085 (JINR-D--9-92-455, pp. 285-288) **Protection gas gaps testing and calculation of breakdown voltage of accelerator inner structures.** Rezvykh, K.A. (Fiziko-Ehnergeticheskij Inst, Obninsk (Russian Federation)); Romanov, V.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224--: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Test results of discharge gaps of the Eh G-2.5 high-voltage accelerator in N_2 - CO_2, C Cl_2 F_2 and S F_6 gases are presented. The technique of calculation of breakdown voltage for the 3 - 4 mm gaps is suggested. The technique allows to estimate the electric strength of hundreds of internal gaps with parallel connection and the reliability of operating and developing accelerators, as well. The calculation accuracy is $\pm$ 5%. 7 refs.

24086 (JINR-D--9-92-455, pp. 409-412) **Submillimeter wave range parametric free-electron laser.** Alekseev, V.I.; Belovintsev, K.A.; Bessonov, E.G.; Kol'tsov, A.V.; Serov, A.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224--: 13. national particle accelerator

conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The experimental facility based on a parametric free-electron laser designed for generating and investigating submillimeter wave range spontaneous and induced ondulator radiation is developed. The 7 MeV microtron with designed average pulse current of 70 mA is a relativistic electron source. Radiation generation occurs during beam passage through ondulator spatial-periodic magnetic field. 3 refs., 3 figs.

24087 (JINR-D–9-92-455, pp. 455-459) **Proposal on construction of high-current racetrack accelerator as an electron injector for a multipurpose breeding target.** Aleksakhin, Yu.I. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Molodozhentsev, A.Yu.; Sidorov, A.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The possibility of construction of a high-resolution neutron source (HRNS) comprising the Ibr - 30 reactor and a racetrack induction electron linac is investigated. It is shown that HRNS thermal neutron flux quality will be comparable with the Ibr - 2 neutron flux at the reactor power less by a factor of 40. The given linac can be used for the production of a power positron flux which will permit to increase the positron acceleration rate at the VEPP - 4 type colliders. 3 refs., 3 figs.

24088 (JINR-D–9-92-455, pp. 467-470) **Rig for study on ion dynamics in RF quadrupole focusing accelerating.** Belikov, V.V. (UNTs, Khar'kovskij Fiziko-Tekhnicheskij Inst (Ukraine)); Zvyagintsev, A.V.; Lymar', A.G.; Suryadnyj, A.V.; Khizhnyak, N.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The rig designed for investigating ion dynamics at accelerating structures with spatial-periodic quadrupole focusing having match box type electrodes is described. Characteristics of accelerating structures having different geometry of accelerating cells and different laws of accelerating field variation along the structure are investigated. It is shown that the given structure provides efficient transversal focusing of ions. 5 refs., 2 figs.

24089 (JINR-D–9-92-455, pp. 497-499) **To the theory of two-beam ion accelerator on the base of a spiral waveguide.** Reshetnikova, K.A. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Ion acceleration rate is investigated on the base of the solution of self-consistent system of hydrodynamic equations considering Cherenkov interaction of beam with two-beam ion accelerator structure. It is shown that ion acceleration rate may be enhanced at a such accelerator at the expanse of using relativistic hallow electron beam of a waveguide placed in a static magnetic field decaying along the axis. 3 refs.

24090 (LBL–36565) **Surveying the monument system at Lawrence Berkeley Laboratory's Advanced Light Source accelerator.** Thur, W.; Lauritzen, T. Lawrence Berkeley Lab., CA (United States). Apr 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-950512–284: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95014836. Source: OSTI; NTIS; GPO Dep.

Particle accelerators with demanding alignment requirements face a need for periodic re-surveying of their reference monument systems. At the ALS, significant foundation settling and the necessary relocation of some floor monuments mean that the entire system of over 100 monuments must be re-surveyed to an accuracy of 100 microns at two year intervals. Last Fall, the monument survey was conducted entirely by the in-house Survey and Alignment crew using a simplified instrument mounting system and an inexpensive commercial software package. Precision levels, plummets, theodolites, and an electronic distance measuring system were used with the innovative "Monopod" instrument mounting system in a cost effective approach to this critical task.

24091 (LS–191) **Nomenclature and name assignment rules for the APS storage ring.** Decker, G. Argonne National Lab., IL (United States). 16 Mar 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015224. Source: OSTI; NTIS; INIS; GPO Dep.

Because the APS accelerators are moving into the fabrication/assembly/installation stage, it is important for consistent naming conventions to be used throughout the project. The intent of this note is to dictate the rules to be adhered to when naming devices in the storage ring. These rules are generic in nature, and shall be applied in principle to the other machines as well. It is essential that every component have a unique and, hopefully, easily recognizable name. Every ASD and XFD group, except for magnets, must interface with the control system. For this reason all device names were developed keeping in mind their actual function, such as controlling or monitoring some device in the ring. Even though magnets are not directly interfaced to the control system, their power supplies are; therefore, a magnet will have the same name as its associated power supply.

24092 (SLAC-PUB–95-6825) **The SLC as a second generation linear collider.** Spencer, J.E. Stanford Linear Accelerator Center, Menlo Park, CA (United States). May 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–179: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013423. Source: OSTI; NTIS; INIS; GPO Dep.

With enough luminosity, the SLC could contribute to most of the high energy physics of current interest such as new hadrons, quark molecules, gluebaus and studies of the Standard Model and Minimal Supersymmetric SM in the form of particle searches for the lowest mass Higgs or selectron or tests of the point-like predictions for the W, Z or $\tilde{e}_R$. Some experiments require alternative incident channels such as $e\gamma$ and $\gamma\gamma$ but only modest increases in energy. Just as the SLC was a prototype for the NLC, it could also be a prototype for a general or γ linear collider – a GLC. Because the main problem is luminosity, we give a scaling relation based on multiple bunches per R-F pulse. We then ask what is possible for the SLC in terms of bunch and train current, emittance and energy at the IP. The results suggest a phased development with the Higgs as a possible last step requiring a luminosity $L \geq 10^{32}$.

24093 (SSCL–675) **PAC++: Object-oriented platform for accelerator codes.** Malitsky, N.; Reshetov, A.; Bourianoff, G. Superconducting Super Collider Lab., Dallas, TX (United States). Jun 1994. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011192. Source: OSTI; NTIS; INIS; GPO Dep.

Software packages in accelerator physics have relatively long life cycles. They had been developed and used for a wide range of accelerators in the past as well as for the current projects. For example, the basic algorithms written in the first accelerator Program TRANSPORT are actual for design of most magnet systems. Most of these packages had been implemented on Fortran. But this language is rather inconvenient as a basic language for large integrated projects that possibly could include real-time data acquisition, data base access, graphic riser interface modules (GUI), arid other features. Some later accelerator programs had been based on object-oriented tools (primarily, C++ language). These range from systems for advanced theoretical studies to control system software. For the new generations of accelerators it would be desirable to have an integrated platform in which all simulation and control tasks will be considered with one point of view. In this report

the basic principles of an object-oriented platform for accelerator research software (PAC++) are suggested and analyzed. Primary objectives of this work are to enable efficient self-explaining realization of the accelerator concepts and to provide an integrated environment for the updating and the developing of the code.

24094 (SSCL-Preprint–507) **Underground measurements of seismic vibrations at the SSC site.** Shiltsev, V.D.; Parkhomchuk, V.V.; Weaver, H.J. Superconducting Super Collider Lab., Dallas, TX (United States). 17 Mar 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011788. Source: OSTI; NTIS; INIS; GPO Dep.

The results of underground measurements of seismic vibrations at the tunnel depth of the Superconducting Super Collider (SSC) site are presented. Spectral analysis of the data obtained in the frequency band from 0.05 Hz to 1500 Hz is performed. It is found that amplitudes of ambient ground motion are less than requirements for the Collider, but cultural vibrations are unacceptably large and will cause fast growth of transverse emittance of the SSC beams.

24095 (SSCL-Preprint–558) **Shielding consideration for the SSCL experimental halls.** Bull, J.; Coyne, J.; Mokhov, N.; Stapleton, G. Superconducting Super Collider Lab., Dallas, TX (United States). Mar 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-940424–38: 8. international conference on radiation shielding, Arlington, TX (United States), 24-27 Apr 1994). Order Number DE95011037. Source: OSTI; NTIS; INIS; GPO Dep.

The Superconducting Super Collider which is being designed and built in Waxahachie, Texas consists Of series of proton accelerators, culminating in a 20 Te proton on proton collider. The collider will be in a tunnel which will be 87 km in circumference and. on average about 30 meters underground. The present design calls for two large interaction halls on the east side of the ring. The shielding for these halls is being designed for an interaction rate of 10^9 Hz or 10^{16} interactions per year, based on 10^7 seconds per operational year. SSC guidelines require that the shielding be designed to meet the criterion of 1mSv per year for open areas off site 2mSv per year for open areas on site, and 2mSv per year for controlled areas. Only radiation workers will be routinely allowed to work in controlled areas. It should be pointed that there is a potential for an accidental full beam loss in either of the experimental halls, and this event would consist of the loss of the full circulating beam up to 4×10^{14} protons. With the present design. the calculated dose equivalent for this event is about 10% of the annual dose equivalent for the normal p-p interactions, so that die accident condition does not control the shielding. If, for instance, local shielding within the experimental hall is introduced into the calculations, this could change. The shielding requirements presented here are controlled by the normal p-p interactions. Three important questions were addressed in the present calculations. They are (1) the thickness of the roof over the experimental halls, (2) the configuration of the shafts and adits which give access to the halls, and (3) the problem of ground water and air activation.

24096 (SSC-SR–1002) **Supercollider program plan. Phase 1.** Superconducting Super Collider Lab., Dallas, TX (United States). Jan 1985. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011066. Source: OSTI; NTIS; GPO Dep.

The purpose of this plan is to describe the Research and Development activities associated with the SSC (Superconducting Super Collider) Phase I program. This Phase I program will provide a comprehensive conceptual design report and is geared to accomplish specific research and development objectives that are required prior to initiation of Construction (Phase II). The overall program objectives are given in Section 2. The plan for assuring that these objectives are attained is described in the SSC Management Plan. An overall description of the planned. program is provided in Section 5. This Phase I program follows an extensive Reference Design Study conducted for the purpose of assessing technical feasibility and probable costs.

24097 (SSC-SR–1003) **Superconducting Super Collider management plan. Phase 1.** Tigner, M. Superconducting Super Collider Lab., Dallas, TX (United States). Feb 1986. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011067. Source: OSTI; NTIS; GPO Dep.

This document is the management plan for the Phase I tasks of the Superconducting Super Collider (SSC) program. Phase I involves Research and Development on SSC accelerator components and systems in order to optimize performance and operating reliability with minimum fabrication and operating costs. Development and demonstration of systems reliability and manufacturability is a major goal of these activities. A Conceptual Design Report, cost estimate and construction schedule along with associated documentation will be prepared.

24098 (SSC-SR–1005) **Report of the task force on SSC commissioning and operations.** Lawrence Berkeley Lab., CA (United States). SSC Central Design Group. 1 Jul 1985. 318p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011069. Source: OSTI; NTIS; GPO Dep.

In 1985 January a Taskforce was organized to study the impact of magnet design on the commissioning and operation of the SSC. The results of the study, in the form of this report, are intended as one of several sources of input for the Magnet Type Selection Committee. Other major input will come from the Magnet Taskforce, the Test String Taskforce, the Cost Estimating Taskforce, and other study groups. All of these efforts will culminate in a magnet type selection, after which concentrated R&D on the selected magnet can commence. The study began with a one-week workshop, held on the UC Berkeley campus in 1985 January 14–18. An interim report of the Taskforce, based on the results of the Workshop, was published on 1985 January 28 (SSC-05). With very few exceptions, the work of the Taskforce was carried out by the participants in the Workshop, both during the workshop and in the subsequent weeks. This report is the collective effort of that group, whose very substantial contribution of time, effort, and thought is gratefully acknowledged.

24099 (SSC-SR–1008) **Proceedings of the meetings on the SSC between representatives of industry and high energy physics.** Superconducting Super Collider Lab., Dallas, TX (United States). 7 Apr 1985. 95p. Sponsored by USDOE, Washington, DC (United States);Michigan Energy and Resource Research Association, Detroit, MI (United States);Michigan Univ., Ann Arbor, MI (United States). DOE Contract AC35-89ER40486. (CONF-841263–EXC: Workshop on reliability in accelerator operations; Superconductor Super Collider (SSC) seminar on industry and high energy physics, Ann Arbor, MI (United States); Ann Arbor, MI (United States), 6 Dec 1984; 7 jan 1985; CONF-8501128–EXC Order Number DE95011072. Source: OSTI; NTIS; GPO Dep.

This report discusses the following topics: Alternate gradient synchrotron (Brookhaven); reliability and large storage ring (SLAC); and Fermilab and superconducting tevatron magnets.

24100 (SSC-SR–1011) **Interim report.** Lawrence Berkeley Lab., CA (United States). SSC Central Design Group. Jun 1985. 193p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011075. Source: OSTI; NTIS; GPO Dep.

This Interim Report summarizes the research and development activities of the Superconducting Super Collider project carried out from the completion of the Reference Designs Study (May 1984) to June 1985. It was prepared by the SSC Central Design Group in draft form on the occasion of the DOE Annual Review, June 19–21, 1985. Now largely organized by CDG Divisions, the bulk of each chapter documents the progress and accomplishments to date, while the final section(s) describe plans for future work. Chapter 1, Introduction, provides a basic brief description of the SSC, its physics justification, its origins, and the R&D organization set up to carry out the work. Chapter 2 gives a summary of the main results of the R&D program, the tasks assigned to the four magnet R&D centers, and an overview of the future plans. The reader wishing a quick look at the SSC Phase I effort can skim Chapter 1 and read Chapter 2. Subsequent chapters discuss in more detail the activities on accelerator physics, accelerator systems, magnets and cryostats, injector, detector R&D, conventional facilities, and project

planning and management. The magnet chapter (5) documents in text and photographs the impressive progress in successful construction of many model magnets, the development of cryostats with low heat leaks, and the improvement in current-carrying capacity of superconducting strand. Chapter 9 contains the budgets and schedules of the COG Divisions, the overall R&D program, including the laboratories, and also preliminary projections for construction. Appendices provide information on the various panels, task forces and workshops held by the CDG in FY 1985, a bibliography of COG and Laboratory reports on SSC and SSC-related work, and on private industrial involvement in the project.

24101 (ANL/ASD/CP–85016) **Longitudinal instability analysis for the IPNS upgrade.** Harkay, K.; Cho, Y.; Lessner, E. Argonne National Lab., IL (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–169: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013437. Source: OSTI; NTIS; INIS; GPO Dep.

The proposed 1-MW spallation neutron source upgrade calls for a 2-GeV rapidly-cycling synchrotron (RCS) with an intensity of 1.04×10^{14} protons per pulse. Due to the high intensity, the potential exists for collective instabilities. Emphasis is placed on controlling these by (a) minimizing the machine impedance by using a contour-following rf shield and (b) maximizing the momentum spread to make use of Landau damping. The coupling impedance is estimated and is dominated by space charge effects. It is found that the longitudinal microwave stability limit can be exceeded unless the momentum spread is sufficient. A longitudinal tracking code was developed to simulate injection and acceleration, including the effects of space charge and other sources of impedance. With the aid of the simulation, and under the assumptions of the instability theory, we arrive at an rf voltage profile and beam injection parameters which avoid both the instability and beam loss through the entire cycle. The limitations of the analysis are explored.

24102 (ANL/ASD/CP–85017) **Transverse instability analysis for the IPNS Upgrade.** Harkay, K.; Cho, Y. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–232: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013752. Source: OSTI; NTIS; INIS; GPO Dep.

The proposed 1-MW spallation neutron source upgrade calls for a 2-GeV rapidly-cycling synchrotron (RCS) with an intensity of 1.04×10^{14} protons per pulse. The potential exists for the excitation of collective, intensity-dependent transverse instabilities. These can normally be controlled by introducing a betatron tune shift or spread, where care is exercised to avoid single-particle resonance effects. Adjusting the chromaticity using sextupoles to vary the head-to-tail phase shift is compared to introducing Landau damping by octupoles. An option for a feedback system is also examined. The momentum spread used for the transverse analysis was obtained from the requirements for longitudinal stability.

24103 (ANL/ASD/CP–85046) **Investigation of resistive wall instability in the 7 GeV APS storage ring.** Chae, Yong-Chul. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–219: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013700. Source: OSTI; NTIS; INIS; GPO Dep.

The Advanced Photon Source (APS) storage ring is a 7-GeV light source with 40 straight sections. Intense x-ray beams will be delivered by 34 insertion devices installed in these straight sections. The vacuum chamber for the insertion devices has an elliptical cross section with the gap equal to 8 mm. With this narrow gap, we estimate that the transverse impedance of the ring at the revolution frequency could be as high as 36 MΩ from the resistive wall. By increasing the (unnormalized) chromaticity to 7, we cure the head-tail modes of order up to m=l for all 60 coupled bunch mode patterns around the ring. Tracking results show that the increased sextupole strength resulting from a higher chromaticity does not significantly reduce the dynamic aperture. Since increased chromaticity alone-cannot cure all the head-tail modes, the APS storage ring will have a feedback system to damp the rigid-bunch modes.

24104 (ANL/ASD/CP–85055) **Longitudinal coupling impedance of a hole in an infinite plane screen.** Chae, Yong-Chul. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–228: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013760. Source: OSTI; NTIS; INIS; GPO Dep.

An analytical formula for the longitudinal coupling impedance of a hole is developed using a variational method. We show that the coupling impedance can be expressed as a sum of functional series, whose argument is the dimensionless quantity kd alone, where k is the free-space wave number and d is the radius of the hole. When expanded in powers of kd, we recover the long wavelength result as a limiting case. The numerical evaluation reveals that the impedance can be well modeled by an RLC-resonator circuit. We also show the qualitatively good agreement between the theory and the MAFIA-T3 simulation for the geometry of a hole in a coupled waveguide with rectangular cross section.

24105 (ANL/PHY/CP–85352) **Longitudinal emittance oscillation in a superconducting drift tube linac.** Kim, J.W.; Shepard, K.W. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–240: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013784. Source: OSTI; NTIS; INIS; GPO Dep.

In drift tube linacs a beam energy spread results form the finite beam size. Radial variation of the axial accelerating field induces a beam energy spread, which, in general, will accumulate as the beam passes through successive drift tubes. This paper shows that under some conditions of periodic transverse focusing and longitudinal phase focusing, the correlation between the longitudinal and transverse motion can be used to correct the energy spread. The process of achieving such a correction is first described in a simplified situation, and then demonstrated for a particular tuning using a ray-tracing program which models a low velocity and low charge state linac designed for radioactive ion beams.

24106 (ANL/PHY/CP–85476) **Transverse emittance systematics measured for heavy-ion beams at ATLAS.** Nolen, J.A.; Barlow, T.A.; Beyer, K.A.; Woody, K.A. Argonne National Lab., IL (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–204: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013524. Source: OSTI; NTIS; INIS; GPO Dep.

The horizontal and vertical beam emittances and ellipse parameters are determined at the ATLAS superconducting heavy-ion linac by the well-known method of measuring the beam width at a profile monitor downstream of a quadrupole magnet as a function of the magnet current. Typically six base-to-base beam widths are measured and used in a least-squares fit to an algebraic expression for the three unknown ellipse parameters. The algorithm was derived from the first order matrix equation for the beam sigma matrix transform through the quadrupole singlet and drift to the profile monitor. To date the emittances of five beams from $^{12}C^{4}$, to $^{238}U^{26+}$. have been measured at the entrance of the Positive-ion Injector Linac, yielding normalized values mostly in the range of 0.25–0.30 π mm-mr. These measurements will be extended systematically to several locations to identify possible sources of emittance growth and to develop more systematic beam tuning procedures.

24107 (BNL–61495) **Colliding Crystalline Beams.** Haffmans, A.F.; Maletic, D.; Ruggiero, A.G. Brookhaven National Lab., Upton, NY (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950512–214: Particle accelerator conference, Dallas, TX

(United States), 1-5 May 1995). Order Number DE95013510. Source: OSTI; NTIS; INIS; GPO Dep.

Crystalline Beams* are an ordered state of an ensemble of ions, circulating in a storage ring, with very small velocity fluctuations. They can be obtained from ordinary warm ion beams with the application of powerful cooling techniques (stochastic, electron, laser, ...). Depending on the focussing properties and dimensions of the storage ring, and on the ion beam density, several ground states are possible. All of them can be visualized as a bundle of n_s symmetrically distributed, parallel strings. The longitudinal ion separation λ is the same for all strings. The minimum temperature that can be achieved depends on die background noise of the cooling technique used. It is required for stability that the vibration amplitude of the ions is only a fraction of the separation λ.

24108 (CONF-910505–443) **CONDOR simulation of an 11.4-GHz traveling wave output cavity.** Goren, Y.; Yu, D. Duly Consultants, Rancho Palos Verdes, CA (United States). [1991]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-90ER81080. From 1991 Institute of Electrical and Electronics Engineers (IEEE) particle accelerator conference (PAC); San Francisco, CA (United States); 6-11 May 1991. Order Number DE95014735. Source: OSTI; NTIS; INIS; GPO Dep.

The CONDOR code is used to simulate the cold test and the beam-induced microwave amplification of an 11.4-GHz, six-cell, disk-loaded, traveling wave cavity. Cold test simulation results are in agreement with a modified Slater's theory. Power extraction at the output port is calculated by launching a train of Gaussian electron bunches through the structure. Results are consistent with recent relativistic klystron experiments using a similar TW output cavity. It is further shown that, depending on operating beam parameters, the power extraction efficiency can be maximized by modification of various cells in the TW structure.

24109 (CONF-910505–444) **Wakefield suppression using beatwave structures.** Yu, D.; Kim, J.S. Duly Consultants, Rancho Palos Verdes, CA (United States). [1991]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-90ER81080. From 1991 Institute of Electrical and Electronics Engineers (IEEE) particle accelerator conference (PAC); San Francisco, CA (United States); 6-11 May 1991. Order Number DE95014736. Source: OSTI; NTIS; INIS; GPO Dep.

A proposed method of suppressing transverse wakefields in an accelerating structure makes use of the fact that superposition of long-range wakes excited by an electron bunch transversing a series of accelerating cells with different transverse frequencies can produce interference cancellation, thereby significantly reducing the magnitudes of the harmful wake potentials. Analytic calculations as well as time-domain and modal sum simulations are performed to the beatwave effects produced by detuned, disk-loaded cavities as function of their transverse frequency spread and the population density.

24110 (CONF-910505–445) **Damping of higher-order modes in a threefold symmetry accelerating structure.** Yu, D. (Duly Consultants, Rancho Palos Verdes, CA (United States)); Kroll, N. Duly Consultants, Rancho Palos Verdes, CA (United States). [1991]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-90ER81080. From 1991 Institute of Electrical and Electronics Engineers (IEEE) particle accelerator conference (PAC); San Francisco, CA (United States); 6-11 May 1991. Order Number DE95014737. Source: OSTI; NTIS; INIS; GPO Dep.

We investigate a waveguide-coupled damping structure with threefold symmetry using the 2-D and 3-D MAFIA codes. Within the frequency range considered, all higher order modes except the TM011 and TE111 modes are heavily damped. Possible ways to detrap these by using asymmetric waveguides offset with respect to the accelerating cavity in the direction of the beam are studied. External Qs and resonant frequencies are calculated using recently developed computer methods.

24111 (FNAL/C–95/171) **Exact map through ideal bends (again?).** Michelotti, L. Fermi National Accelerator Lab., Batavia, IL (United States). Jun 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-950512–262: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95014663. Source: OSTI; NTIS; INIS; GPO Dep.

There are three logically independent facets to calculating the transfer map through a bend magnet: physics, geometry, and representation. We will derive the exact map for transit through ideal bends while separating these three, esp., isolating the geometry problem from the other two.

24112 (JINR-D–9-92-455, pp. 153-155) **Correction of nuclotron magnetic field.** Mikhajlov, V.A. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Shchepunov, V.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Results of the simulation of magnetic field correction at the Nuclotron (Dubna, JINR) by the Monte Carlo, dynamic and harmonics methods are presented. Possible variants of correctors switching are considered and estimations of fields necessary for the correction are given. The position of correctors and pick-up electrodes in the correction scheme is shown. 6 refs., 2 tabs., 2 figs.

24113 (JINR-D–9-92-455, pp. 277-279) **Calculation of beam radial quality in the U-120K cyclotron.** Borisov, O.N. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Vorozhtsov, S.B.; Dmitrievskij, V.P.; Mazurkevich, G.E.; Yuldasheva, M.B. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Effects of beam radial quality and accelerator central region on radial oscillation amplitudes at the 30 MeV U-120K isochronous cyclotron to deliver protons up to 100 μ A are investigated. Three-dimensional distributions of the electric field in the central region of the accelerator are obtained. Beam dynamics in modes from the injection point to the final radius of extraction is studied. The value of radial oscillation amplitudes is determined. 3 refs., 3 figs.

24114 (JINR-D–9-92-455, pp. 289-292) **Calculation of three-dimensional electrostatic field of an accelerator structure on the base of two-dimensional analysis.** Rezvykh, K.A. (Fiziko-Ehnergeticheskij Inst, Obninsk (Russian Federation)); Romanov, V.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

An algorithm to calculation of the high-voltage accelerator asymmetric electrostatic field based on the two-dimensional analysis is suggested. Calculation accuracy of the spark gap field and the high-voltage accelerator structure is investigated. In the vicinity of maximum field strength the accuracy is $\pm$ 2 - 3%. Two-dimensional analysis of the asymmetric field allows to eliminate the calculational model roughness. 4 refs., 5 figs.

24115 (JINR-D–9-92-455, pp. 342-344) **Calculation of axial-symmetric magnetic fields at the presence of conducting shields with cuttings.** Derendyaev, Yu.S. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Dolbilov, G.V.; Karlov, A.A.; Kuznetsov, A.B.; Petrov, V.A.; Smolyakova, T.F. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The technique of the calculation of pulse solenoidal magnetic field radial component shielding with the help of axial-symmetric shields with slits is suggested. Results of the calculation of the SILUND induction electron linac focusing system shielding are compared with the measurement data. 2 refs., 3 figs.

24116 (JINR-D–9-92-455, pp. 419-423) **Spectral-angular characteristics of synchrotron light in an strong-focusing accelerator.** Shishanin, O.E. (Moskovskij Avtomobilestroitel'nyj Inst, Moscow (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The problem of electron dynamics in a periodical magnetic field with the field index being much higher than the unit is considered. The obtained solutions are used for investigating Bremsstrahlung radiation. 6 refs., 1 fig.

24117 (JINR-D–9-92-455, pp. 435-438) **Wake field excitation by an electron bunch and charged particle acceleration in an inhomogeneous plasma.** Balakirev, V.A. (Khar'kovskij Fiziko-Tekhnicheskij Inst, Kharkov (Ukraine)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Numerical simulation of the excitation of a wake wave in an inhomogeneous plasma by an electron bunch and charged particle acceleration is conducted. 3 refs., 3 figs.

24118 (JINR-D–9-92-455, pp. 439-442) **Charged particle acceleration by a wake field in magnetoactive plasma waveguide.** Balakirev, V.A. (Khar'kovskij Fiziko-Tekhnicheskij Inst, Kharkov (Ukraine)); Onishchenko, I.N.; Sotnikov, G.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Charged particle acceleration by wake fields in a magnetoactive plasma waveguide is studied. Two peculiarities due to the gyrotropy of a plasma waveguide have been taken into account. On one hand the occurrence of a hybrid wave having the maximum of longitudinal electric field not at the axis of the system but in the volume of a plasma is considered. On the other hand the existence of a higher-hybrid (cyclotron) branch of oscillations is considered too. 7 refs., 4 figs.

24119 (JINR-D–9-92-455, pp. 443-446) **Corrugated plasma column as a slowing-down structure for an accelerator.** Markov, P.I. (Khar'kovskij Fiziko-Tekhnicheskij Inst, Kharkov (Ukraine)); Onishchenko, I.N.; Sotnikov, G.V.; Fajnberg, Ya.B. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Dispersion characteristics of a corrugated plasma column produced during plasma or low-energy electron beam injection into a corrugated magnetic field are investigated. 8 refs., 2 figs.

24120 (JINR-D–9-92-455, pp. 447-450) **Two-beam acceleration of charged particles in a corrugated waveguide.** Ostrovskij, A.O. (Khar'kovskij Fiziko-Tekhnicheskij Inst, Kharkov (Ukraine)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The scheme of two-beam acceleration of relativistic electrons in a vacuum corrugated waveguide is considered. In the given scheme of acceleration the guiding and driven beams are set at different resonances in relation to electromagnetic wave. It is shown that the usage of a high-current relativistic electron beam may provide the RF-field intensity of 190 MV/m and energy gain rate of 40 MeV/m. 3 refs., 2 figs.

24121 (JINR-D–9-92-455, pp. 451-454) **Beam loading of an active resonator in a stationary mode.** Martynchuk, N.N. (RAN, Fizicheskij Inst im. P.N.Lebedeva, Moscow (Russian Federation)); Lebedev, A.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The optimization of standing wave resonator beam loading at an electron linac is considered. It is shown that in order to realize the maximum energy gain and the minimization of power reflection in a resonator it is necessary to choose the correspondent phase shift introduced by a resonator together with a coupling device, and/or the value of amplitude transfer factor determined only by a coupling device. 4 refs., 4 figs.

24122 (JINR-D–9-92-455, pp. 464-466) **Influence of accelerating field third harmonics on steady-state processes and limiting current of a microtron.** Kol'tsov, A.V. (RAN, Fizicheskij Inst im. P.N.Lebedeva, Moscow (Russian Federation)); Serov, A.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The establishment of acceleration mode in a microtron resonator where the E_{011} oscillation mode is excited by beam current third harmonics is considered. The process of accelerated current steady-state condition at different values of resonator supplying power and cathode different temperatures is considered too. 9 refs., 2 figs.

24123 (JINR-D–9-92-455, pp. 471-476) **Nonlinear regime of performance of a system for damping bunch transverse dipole oscillations in the IHEP accelerator.** Vershinin, A.I. (Institut Fiziki Vysokikh Ehnergij, Protvino (Russian Federation)); Lebedev, O.P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Nonlinear mode of operation of a feedback system intended for the suppression of beam transversal dipole oscillations at the IHEP accelerator is experimentally investigated. The feedback circuit during bunch injection operated in nonlinear mode where the initial oscillations suppression took place; at attaining fixated threshold amplitude the transition to the linear mode occurred. It is shown that the visible increase of suppression rate can be obtained in case of having minimal technical aids. Suppression time during injection constituted 1.5 ms. 3 refs., 4 figs.

24124 (JINR-D–9-92-455, pp. 477-479) **Maximum currents in a collective ion accelerator on the base of high-current electron beam in a corrugated structure.** Il'ina, N.V. (RAN, Moskovskij Radiotekhnicheskij Inst, Moscow (Russian Federation)); Rozanov, H.E. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The process of ion collective acceleration by a hallow electron beam propagating in a strong longitudinal magnetic field in a structure comprising alternating sections of large and smaller radius is investigated. The numerical investigation showed that ion resonance acceleration takes place in a corrugated structure with modulated electron beam. The current of accelerated ions equals to 0.1 A. 7 refs., 2 figs.

24125 (JINR-D–9-92-455, pp. 480-486) **Calculation of non-stationary beam dynamics in an electron linac with short current pulse duration.** Masunov, Eh.S. (Moskovskij Inzhenerno-Fizicheskij Inst., Moscow (Russian Federation)); Morozov, V.L. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The accurate electrodynamic problem of particle radiation in an inhomogeneous waveguide section matched at the waveguide ends is solved aiming at the calculation of a high-current beam dynamics with account of proper RF-fields. 4 refs., 2 figs.

24126 (JINR-D–9-92-455, pp. 487-489) **Transversal dynamics of a short-pulse beam in a sectional electron linac.** Bulyak, E.V. (Khar'kovskij Fiziko-Tekhnicheskij Inst, Kharkov (Ukraine)); Kurilko, V.I.; Makhnenko, L.A.; Opanasenko, A.I.; Ryabka, P.M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Transversal dynamics of a short-pulse beam in the LUEh - 300 resonance electron linac is investigated. It is shown that accelerated beam limiting charge in the LUEh - 300 is limited not by the level of stored microwave field in the accelerator section but by the beam transversal instability. 4 refs., 2 figs.

24127 (JINR-D–9-92-455, pp. 490-492) **Electron acceleration by nonlinear wakefield in a plasma with mobile ions.** Rozanov, N.E. (RAN, Moskovskij Radiotekhnicheskij Inst, Moscow (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Collective acceleration of electrons in a plasma by wake fields is considered. Limiting characteristics for the given collective accelerator with account of plasma ion dynamics are obtained. 5 refs.

24128 (JINR-D–9-92-455, pp. 493) **Self consistent longitudinal dynamics of a bunch in an accelerator based on the Vavilov-Cherenkov effect in a dielectric.** Barsukov, K.A. (Sankt-Peterburgskij Ehlektrotekhnicheskij Inst, Sankt-Peterburg (Russian Federation)); Kanarejkin, A.D.; Kustov, A.L. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Longitudinal dynamics of an electron bunch in a dielectric-loaded waveguide of a wakefield accelerator is investigated. Limitations for an accelerator structure designed for obtaining fields of up to 100 MeV/m are calculated. It is shown that for asymmetrical bunches providing for the increase of the transformation factor, the length where the efficient acceleration can be obtained is much higher than for symmetrical Gauss bunches. 3 refs.

24129 (JINR-D–9-92-455, pp. 494-496) **On the efficiency of coupling of electron beam with ondulator and H-wave fields.** Reshetnikova, K.A. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The problem of the interaction of magnetized electron beam with slow-down H-wave fields and with ondulator field is solved aiming at the study on nonlinear stabilization of free-electron laser instability modes of operation. 4 refs.

24130 (LA-UR–95-1549) **Electron clearing in the Los Alamos Proton Storage Ring.** Plum, M.A.; Allen, J.; Borden, M.J.; Fitzgerald, D.H.; Macek, R.J.; Wang, T.S. Los Alamos National Lab., NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950512–150: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011977. Source: OSTI; NTIS; INIS; GPO Dep.

The instability observed in the Los Alamos Proton Storage Ring (PSR) has been tentatively identified as an electron-proton instability. A source of electrons must exist for this instability to occur. The PSR injection section contains the stripper foil, and therefore provides several strong sources of electrons. An electron clearing system was installed in the injection section to clear out these electrons. The system comprised: (1) a foil biasing system to clear the SEM and thermionic electrons, (2) a pair of low-field bending magnets with a Faraday cup to clear the convoy electrons, and (3) two pairs of clearing electrodes, one upstream and one downstream of the stripper foil, to clear the remaining electrons. This paper discusses the design and performance of the Electron Clearing System, and its effect on the instability. Also presented are some results from other charge-collection experiments that suggest there is also substantial electron production in parts of the ring other than the injection section.

24131 (LA-UR–95-1567) **A theoretical study of the electron-proton instability in a long proton pulse.** Wang, Tai-Sen F. Los Alamos National Lab., NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950512–146: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011972. Source: OSTI; NTIS; INIS; GPO Dep.

The electron-proton instability of a long, intense, and partially neutralized proton bunch is studied by numerically solving the equations of motion for the line centroid of the proton beam and the line centroid of the trapped electrons. The formalism takes into account the effects of variable line densities and alternating-gradient focusing. Good qualitative agreement between the computational results and experimental observations was obtained when applying the theory to the Los Alamos Proton Storage Ring (PSR). Both the case of a clean extraction gap and the case with a few percent of protons in the extraction gap were studied. It is found that with only a few percent neutralization, the PSR beam can become unstable in both cases. The same equations and method were used to study the stability of the proton beam in the accumulator ring of the proposed LANSCE II spallation-neutron source. The results indicate that the e-p instability can also occur in the LANSCE II accumulator ring for only a few percent neutralization.

24132 (LA-UR–95-1568) **Recent progress on beam stability study in the PSR.** Wang, T. (and others); Channell, P.; Cooper, R. Los Alamos National Lab., NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950512–153: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011971. Source: OSTI; NTIS; INIS; GPO Dep.

A fast transverse instability has been observed in the Los Alamos Proton Storage Ring (PSR) when the injected beam intensity reaches more than 2×10^{13} protons per pulse. Understanding the cause and control of this instability has taken on new importance as the neutron-scattering community considers the next generation of accelerator-driven spallation-neutron sources, which call for peak-proton intensities of 10^{14} per pulse or higher. Previous observations and theoretical studies indicate that the instability in the PSR is most likely driven by electrons trapped within the proton beam. Recent studies using an experimental electron-clearing system and voltage-biased pinger-electrodes for electron clearing and collection support this hypothesis. Experiments have also been performed to study the instability threshold when varying the electron production rate. Theoretical studies include a computer simulation of a simplified model for the e – p instability and the investigation of possible electron confinement in the ring-element magnetic fields. This paper reports some recent results from these studies.

24133 (LNF-P–95-016) **Multi-bunch energy spread induced by beam loading in standing wave structure.** Ferrario, M. (Istituto Nazionale di Fisica Nucleare, Frascati (Italy). Lab. Nazionale di Frascati); Tazzioli, F.; Mosnier, A.; Tessier, J; Serafini, L. Istituto Nazionale di Fisica Nucleare, Frascati (Italy). Apr 1995. 30p. Order Number DE95789751. Source: OSTI; NTIS (US Sales Only).

The interaction of a relativistic beam with the modes of the TM_{010} pass-band of a multicell cavity does not cause any problem: although all the modes are excited by the RF (radiofrequency) generator, resulting in different cell excitations during the cavity filling and the beam pulse, the net accelerating field exhibits negligible fluctuations from bunch to bunch. However, when the beam is not fully relativitstic, this is no more true. The phase slippage occurring in the first cells, between the non relativistic beam and the lower pass-band modes, produces an effective enhancement of the shunt impedances, which is usually negligible for a relativistic beam in a well tuned cavity. Moreover, the voltage jumps (amplitude and phase) occurring at each bunch passage, as well as the beam detuning caused by the off-crest bunches, vary from cell to cell. These effects enhance dramatically the fluctuation of the accelerating voltage, with a dominant beating provided by the pass-band mode nearest to the pi-mode. The induced beam energy spread has been estimated by the help of two distinct codes, developed at Frascati (Italy) and (Saclay), with results in good agreement. While an interaction integral is computed at each bunch passage, the cavity refilling is calculated by solving coupled differential equations of the modes of the pass-band, driven by a generator linked to one end-cell. It is shown also that the intermode coupling arises from the external Q of the drive end-cell, and not from the wall losses. For illustration, the authors applied the method to the beam-loading problem in the SC capture cavity of the low charge injector of the TESLA test facility installed at DESY.

24134 (LS–183) **Difference resonance study on the electron storage ring Aladdin at SRC.** Liu, J. (Argonne National Lab., IL (United States)); Crosbie, E.; Teng, L.; Bridges, J.; Symon, K.; Trzeciak, W. Argonne National Lab., IL (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015398. Source: OSTI; NTIS; INIS; GPO Dep.

We have studied the third-order betatron difference resonance on the electron storage ring Aladdin at SRC. The spare chromaticity correcting sextupoles were utilized to drive the desired harmonics and a pulsed kicker magnet was fired to produce the coherent oscillation of a single beam bunch. We took beam position measurements from four pairs of stripline electrodes and data acquisition devices. We observed the coupling resonance. Several typical measurements are shown. A computer program was written using multipartite tracking to simulate the bunch motion. The simulations agree well both with analytic predictions and with the experimental results.

24135 (LS–196) **Preliminary study of insertion device effect on dynamic aperture using RACETRACK.** Chae, Yong-chul; Crosbie, E.A. Argonne National Lab., IL (United States). 8 May 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015220. Source: OSTI; NTIS; INIS; GPO Dep.

We studied the effects of an insertion device (ID) on the dynamic aperture using the new version of RACETRACK. We found that the nonlinear effect of the ID is the dominant effect on the dynamic aperture reduction compared to the other multipole errors which exist in the otherwise ideal lattice. The previous study of dynamic aperture was based on the assumption that the effect of the fast oscillating terms in L. Smith's Hamiltonian is small, and hence can be neglected in the simulation. The remarkable agreement between the previous study and the current results using RACETRACK, including all effects of the fast oscillating terms, justified those assumptions at least for the APS ring.

24136 (LS–213) **Global DC closed orbit correction experiment on the NSLS x-ray ring.** Chung, Y.; Decker, G.; Evans, K. Argonne National Lab., IL (United States). 15 Sep 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95015568. Source: OSTI; NTIS; INIS; GPO Dep.

In this note are described the global DC closed orbit correction experiments conducted on the X-ray ring at National Synchrotron Light Source (NSLS). The beam response matrix, defined as beam motion at BPM locations per unit kick by corrector magnets, was measured and then inverted using the technique of singular value decomposition (SVD). The product of the inverted matrix and the difference orbit gives the incremental kick strengths necessary to correct the orbit. As a result, the r.m.s. orbit error around the ring was reduced from 208 μm to 61 μm.

24137 (LS–231) **User's manual for elegant Program Version 12.4, Manual Version 1.** Borland, M. Argonne National Lab., IL (United States). 6 May 1993. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015204. Source: OSTI; NTIS; INIS; GPO Dep.

Elegant stands for "Electron Generation and Tracking," a somewhat out-of-date description of a fully 6D accelerator program that now does much more than generate particle distributions and track them elegant, written entirely in the C programming language, uses a variant of the MAD input format to describe accelerators, which may be either transport lines, circular machines, or a combination thereof. Program execution is driven by commands in a namelist format. This document describes the features available in elegant, listing the commands and their arguments. The differences between elegant and MAD formats for describing accelerators are listed. A series of examples of elegant input and output are given. Finally, appendices are included describing the post-processing programs.

24138 (NSA–95-1) **Calculation of beam neutralization in the IPNS-Upgrade RCS.** Chae, Yong-Chul. Argonne National Lab., IL (United States). 26 Jan 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95013448. Source: OSTI; NTIS; INIS; GPO Dep.

The author calculated the neutralization of circulating beam in this report. In the calculation it is assumed that all electrons liberated from the background molecules due to the collisional processes are trapped in the potential well of the proton beam. Including the dependence of ionization cross sections on the kinetic energy of the incident particle, the author derived the empirical formula for beam neutralization as a function of time and baseline vacuum pressure, which is applicable to the one acceleration cycle of the IPNS-Upgrade RCS.

24139 (NSA–95-2) **Electron-proton instability in the IPNS-Upgrade RCS: Part I.** Chae, Yong-Chul. Argonne National Lab., IL (United States). 27 Feb 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95013447. Source: OSTI; NTIS; INIS; GPO Dep.

The electron-proton instability in the IPNS-Upgrade RCS is investigated in this report. A dispersion relation applicable to the coasting beam is derived, and the approximations used are stated in order to facilitate the understanding of the underlying mechanism of the instability. The threshold of instability in terms of neutralization of the circulating beam is found for the IPNS-Upgrade RCS. The dependence of threshold on the beam size and the lattice tune is also studied and its numerical results are presented.

24140 (NSA–95-3) **Study of synchro-betatron coupling in IPNS upgrade RCS.** Harkay, K.C. Argonne National Lab., IL (United States). 3 Mar 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95013449. Source: OSTI; NTIS; INIS; GPO Dep.

The 2 GeV rapidly-cycling synchrotron (RCS) of the proposed 1-MW spallation neutron source upgrade has 16 dispersion-free straight sections and eight straight sections with a dispersion of approximately 1 m. Six of the ten rf cavities are located in dispersion-free straight sections, and the remainder are located in the non-dispersion-free straight sections. The possibility of exciting synchro-betatron resonances is investigated in this paper. It is found that the effect of the coupling is not important to the RCS. Synchro-betatron resonances are driven in single beams by position-dependent energy gains from the accelerating fields. A primary cause is the dispersion at the location of the rf cavities. Longitudinal and transverse motions are coupled due to a transverse deflection associated with a particle crossing the rf cavity

gap. This changes the equilibrium orbit and excites betatron oscillations.

24141 (NSA–95-4) **Study of corrections to the geometrical factor in the space charge impedance for the IPNS upgrade.** Harkay, K.C. Argonne National Lab., IL (United States). 17 Mar 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95013446. Source: OSTI; NTIS; INIS; GPO Dep.

Collective instabilities are an important consideration in the 2-GeV rapidly-cycling synchrotron (RCS) of the proposed 1-MW spallation neutron source upgrade due to the very high beam intensity of 1.04×10^{14} protons per pulse. Collective instabilities are intensity-dependent effects which arise due to the electromagnetic wake fields generated by the beam as it interacts with its surroundings. The interactions are characterized by the coupling impedance, which in the RCS is dominated by space charge effects. To minimize the space charge impedance, the vacuum chamber is constructed with a special wire rf shield. Estimating the longitudinal and transverse impedance due to space charge is critical for the beam stability analysis. The standard geometrical factors used to evaluate the space charge impedance assume a uniform, round, unbunched beam in a cylindrical, smooth beam pipe. Two corrections to the geometrical factors have been proposed to account separately for the wire rf-screening cage and the more realistic varying elliptical beam cross-section. These corrections are studied in the case of the RCS. It is found that including these details results in a correction of less than 20%.

24142 (SAND–94-1911) **High-power electron-beam transport in long gas cells from 10^{-3} to 10^{3} Torr nitrogen.** Sanford, T.W.L. Sandia National Labs., Albuquerque, NM (United States). Feb 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941101–11: Meeting of the Division of Plasma Physics of the American Physical Society, Minneapolis, MN (United States), 7-11 Nov 1994). Order Number DE95010334. Source: OSTI; NTIS; GPO Dep.

Measurements and analyses show that the 13-TW, pulsed Hermes-III electron beam, with current near the Alfven limit, has two regimes of stable transport: a low-pressure window (between $\sim$ 1 and $\sim$ 100 mTorr) that is dominated by propagation in the semi-collisionless IFR (ion-focused regime), and a high-pressure window (between $\sim$ 1 and $\sim$ 100 Torr) that is dominated by propagation in the resistive CDR (collision-dominated regime). Below $\sim$ 1 mTorr, there is insufficient ionization to confine the beam; between the windows, the two-stream and hollowing instabilities disrupt propagation; and above $\sim$ 100 Torr, the resistive hose instability degrades propagation.

24143 (SLAC-PUB–95-6684) **Beam distributions beyond RMS.** Decker, F.J. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Sep 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9410219–25: Beam instrumentation workshop, Vancouver (Canada), 2-6 Oct 1994). Order Number DE95013398. Source: OSTI; NTIS; INIS; GPO Dep.

The beam is often represented only by its position (mean) and the width (rms = root mean squared) of its distribution. To achieve these beam parameters in a noisy condition with high backgrounds, a Gaussian distribution with offset (4 parmeters) is fitted to the measured beam distribution. This gives a very robust answer and is not very sensitive to background subtraction techniques. To get higher moments of the distribution, like skew or kurtosis, a fitting function with one or two more parameters is desired which would model the higher moments. In this paper we will concentrate on an Asymmetric Gaussian and a Super Gaussian function that will give something like the skew and the kurtosis of the distribution. This information is used to quantify special beam distribution. Some are unwanted like beam tails (skew) from transverse wakefields, higher order dispersive aberrations or potential well distortion in a damping ring. A negative kurtosis of a beam distribution describes a more rectangular, compact shape like with an over-compressed beam in z or a closed to double-horned energy distribution, while a positive kurtosis looks more like a "Christmas tree" and can quantify a beam mismatch after filamentation. Besides the advantages of the quantification, there are some distributions which need a further investigation like long flat tails which create background particles in a detector. In particle simulations on the other hand a simple rms number might grossly overestimate the effective size (e.g. for producing luminosity) due to a few particles which are far away from the core. This can reduce the practical gain of a big theoretical improvement in the beam size.

24144 (SLAC-PUB–95-6791) **Optimization of the NLC final focus system.** Zimmermann, F.; Helm, R.; Irwin, J. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jun 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–195: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95014655. Source: OSTI; NTIS; INIS; GPO Dep.

An optimization scheme for final focus systems is discussed and applied to the NLC design. The optical functions at the defocusing sextupoles, the sextupole strength, and the length of the system must obey eight conditions that are imposed by the spot size increase due to higher-order aberrations, the effects of synchrotron radiation in the bending magnets, power supply ripple, magnet vibration tolerances, and the estimated orbit stability at the sextupoles. These eight conditions determine the minimum optimum length of the system. The NLC final focus design was shortened to this optimum.

24145 (SLAC-PUB–95-6802) **Coupling impedance of a periodic array of diaphragms.** Stupakov, G.V. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jun 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–184: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95014648. Source: OSTI; NTIS; INIS; GPO Dep.

A method is presented for calculating the high-frequency longitudinal and transverse coupling impedances in a periodic array of diaphragms in a circular perfectly conducting pipe. The method is based on Weinstein's theory of diffraction of a plane electromagnetic wave on a stack of halfplanes. Using Weinstein's solution, it is shown that the problem of finding the beam field in the pipe reduces to an effective boundary condition at the radius of the diaphragms that couples the longitudinal electric field with the azimuthal magnetic one. Solving Maxwell's equations with this boundary condition leads to simple formulae for Z_{long} and Z_{tr}. A good agreement with a numerical solution of the problem found by other authors is demonstrated.

24146 (SLAC-PUB–95-6806) **Flat beam spot sizes measurement in the SLC-final focus.** Raimondi, P.; Decker, F.J. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jun 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–223: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95014542. Source: OSTI; NTIS; INIS; GPO Dep.

With the switch to flat beam operation in the SLC during the 1993 run, it has become necessary to develop an algorithm that is capable of measuring the beam spot sizes at the Final Focus Interaction Point (IP). This algorithm uses the correct beam-beam deflection formula for the more general flat-beam case, since the round beam approximation is no longer valid. The application of this formula to the IP spot size measurements in the SLC Final Focus is the subject of this paper.

24147 (SLAC-PUB–95-6840) **Fast symplectic mapping and quasi-invariants for the Large Hadron Collider.** Warnock, R.L. (Stanford Linear Accelerator Center, Menlo Park, CA (United States)); Berg, J.S.; Forest, E. Stanford Linear Accelerator Center, Menlo Park, CA (United States). May 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–177: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013378. Source: OSTI; NTIS; INIS; GPO Dep.

Beginning with a tracking code for the LHC, we construct the canonical generator of the full-turn map in polar coordinates. For very fast mapping we adopt a model in which the momentum is modulated sinusoidally with a period of 130 turns (very close to the synchrotron period). We achieve symplectic mapping of 10^7 turns in 3.6 hours on a workstation. Quasi-invariant tori are constructed

on the Poincare section corresponding to multiples of the synchrotron period. The possible use of quasi-invariants in derivin, long-term bounds on the motion is discussed.

24148 (SSCL–564) **On the feasibility of tracking with differential-algebra maps in long-term stability studies for large hadron colliders.** Kleiss, R. (CERN, Geneva (Switzerland)); Schmidt, F.; Yan, Y. Superconducting Super Collider Lab., Dallas, TX (United States). Jan 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (DESY-HERA–92-01; CERN-SL–92-02(AP)). Order Number DE95011201. Source: OSTI; NTIS; INIS; GPO Dep.

A time-saving alternative to conventional element-by-element tracking in long-term stability studies is the use of truncated Taylor maps. This report discusses how the non-symplecticity of a moderately high-order truncated Taylor map affects its reliability when the map is used for tracking over several thousand turns. Various machines and two different map-constructing programs are compared. It is found that the discrepancies between the Taylor map results and those obtained by direct tracking grow with amplitude. Thus, such maps are not guaranteed to be sufficient for long-term tracking over millions of turns without suitable symplectification.

24149 (SSCL–640) **Passing through half-integer resonance due to space charge under different initial distributions.** Senichev, Y. (Superconducting Super Collider Lab., Dallas, TX (United States)); Budzko, A. Superconducting Super Collider Lab., Dallas, TX (United States). Sep 1993. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011183. Source: OSTI; NTIS; INIS; GPO Dep.

The problem of space charge continues to be interesting in connection with the development of the Kaon and Neutron Facilities and the Superconducting Super Collider projects. In the former, the high average intensity of the proton beam can be reached by a super-high pick current in each acceleration cycle, giving rise to the painting procedure. In colliders, as is known, super luminosity can be reached by minimization of emittance growth under acceleration. In other words, the task consists of the beam acceleration with the maximum attainable density of current and with minimum achievable emittance growth. This is why this task arises when new accelerator projects are developed. There are at least two ways to investigate the space-charge effects on the designing stage: analytical and numerical simulations. Each has its own advantages and disadvantages. The numerical simulation, with its use of macro particles approximation, is very well developed but it requires a lot of computer time and has limited flexibility in the variation of the initial conditions. As a result, the numerical methods are restricted in optimization possibility. Analytical investigation gives a clearer idea about physical phenomena, but it must simplify the physical model and sometimes gives an incorrect interpretation of results. Analytical research can be divided into two types: the envelope equation method for self-consistent distribution, and the nonlinear equation for higher distribution moments. In our work we use numerical simulation as the base to achieve the correct results, but for interpretation of results the simplified analytical model is used as well.

24150 (SSCL-Preprint–513) **New transverse damper correction scheme.** Lopez, G. Superconducting Super Collider Lab., Dallas, TX (United States). Oct 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011219. Source: OSTI; NTIS; INIS; GPO Dep.

A transverse damping system for providing beam motion stability against Dipole Mode Multibunch Instabilities (DMMI) in the Superconducting Super Collider (SSC) is outlined. This damper makes use of two monitors and one kicker, as in existing designs. The novel feature is the use of a new correction scheme, which provides exact orbit compensation within two turns.

24151 (SSCL-Preprint–519) **Compensation of the beam-beam effect in proton-proton colliders.** Tsyganov, E. (Superconducting Super Collider Lab., Dallas, TX (United States)); Meinke, R.; Nexsen, W.; Zinchenko, A. Superconducting Super Collider Lab., Dallas, TX (United States). Oct 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011217. Source: OSTI; NTIS; INIS; GPO Dep.

Compensation of the beam-beam effect in high-energy proton-proton colliders using a low-energy electron beam is proposed. It is concluded that such compensation looks feasible. Requirements for such a device are formulated.

24152 (SSCL-Preprint–550) **Principles of interaction region design in Hadron Colliders and their application to the SSC.** Nosochkov, Y.; Sen, T.; Courant, E.; Garren, A.; Ritson, D.M.; Stirninh, T.; Dyphrtd, M.J. Superconducting Super Collider Lab., Dallas, TX (United States). Jan 1994. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011033. Source: OSTI; NTIS; INIS; GPO Dep.

The high luminosity Interaction Regions (IRs) are an important part of the lattice in colliding beam machines. The performance of the collider may depend significantly on the particular design of the IRs. In this paper we discuss the general principles of IR design and apply these principles to the design of the Superconducting Super Collider Interaction Regions.

24153 (UCRL-JC–119186) **Analytic electrostatic solution of an axisymmetric accelerator gap.** Boyd, J.K. Lawrence Livermore National Lab., CA (United States). 15 Mar 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950512–224: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95014157. Source: OSTI; NTIS; INIS; GPO Dep.

Numerous computer codes calculate beam dynamics of particles traversing an accelerating gap. In order to carry out these calculations the electric field of a gap must be determined. The electric field is obtained from derivatives of the scalar potential which solves Laplace's equation and satisfies the appropriate boundary conditions. An integral approach for the solution of Laplace's equation is used in this work since the objective is to determine the potential and fields without solving on a traditional spatial grid. The motivation is to quickly obtain forces for particle transport, and eliminate the need to keep track of a large number of grid point fields. The problem then becomes one of how to evaluate the appropriate integral. In this work the integral solution has been converted to a finite sum of easily computed functions. Representing the integral solution in this manner provides a readily calculable formulation and avoids a number of difficulties inherent in dealing with an integral that can be weakly convergent in some regimes, and is, in general, highly oscillatory.

24154 (ANL/ASD/CP–83556) **APS injector synchrotron low-level RF system design and test.** Stepp, J.D.; Bridges, J.F. Argonne National Lab., IL (United States). [1994]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-940618–121: 4. European particle accelerator conference, London (United Kingdom), 27 Jun - 1 jul 1994). Order Number DE95015835. Source: OSTI; NTIS; INIS; GPO Dep.

We describe the control of the RF system for the injector synchrotron (booster) of the 7-GeV Advanced Photon Source. The rf system consists of one klystron and four 5-cell cavities of the LEP type. A block diagram of the system is shown and the low power rf circuitry is described. Voltage and phase feedback are discussed, along with accelerating the beam to 7 GeV. The accelerating voltage is programmed with a waveform generator. Although the acceleration is constant, the power at injection is almost zero and at extraction it is near 600 kW. The power increases with beam energy to replace synchrotron radiation losses. Stability of the rf phase between the two sides of the ring are discussed. Control signals are described which synchronize the bunch during injection from an accumulator ring and for extraction to the 352-MHz bucket in the storage ring. Timing for injection into any bucket in the Storage Ring is accomplished in the rf controls interface located on the VM cards. There is only one bunch accelerated in the booster at a

time, so the beam loading of the cavities is negligible. Operating experience during early commissioning efforts will also be outlined.

24155 (ANL/ASD/CP–84923) **A photocathode rf gun design for a mm-wave linac-based FEL.** Nassiri, A.; Berenc, T.; Foster, J.; Waldschmidt, G.; Zhou, J. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–258: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013724. Source: OSTI; NTIS; INIS; GPO Dep.

In recent years, advances in the rf gun technology have made it possible to produce small beam emittances suitable for short period microundulators which take advantage of the low emittance beam to reduce the wavelength of FELs. At the Advanced Photon Source, we are studying the design of a compact 50-MeV superconducting mm-wave linac-based FEL for the production of short wavelengths (~300 nm) to carry out FEL demonstration experiments. The electron source considered for the linac is a 30- GHz, 3 1/2-cell π-mode photocathode rf gun. For cold model rf measurements a 15-GHz prototype structure was fabricated. Here we report on the design, numerical modelling and the initial cold-model rf measurement results on the 15-GHz prototype structure.

24156 (ANL/ASD/CP–84924) **Beamline smoothing of the Advanced Photon Source.** Friedsam, H.; Penicka, M.; Zhao, S. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–171: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013415. Source: OSTI; NTIS; GPO Dep.

This paper outlines a general beamline smoothing concept based on the use of First Principle Component analysis. Bean-dine smoothing is commonly used for the detection of blunders in the positioning of beam elements and to provide a smooth particle beam path with the fewest adjustments to individual beam components. It also provides the data for assessment of the achieved positioning quality.

24157 (ANL/ASD/CP–84987) **Initial tests of the dual-sweep streak camera system planned for APS particle-beam diagnostics.** Lumpkin, A. (Argonne National Lab., IL (United States)); Yang, B.; Gai, W.; Cieslik, W. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–247: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013774. Source: OSTI; NTIS; INIS; GPO Dep.

Initial tests of a dual-sweep streak system planned for use on the Advanced Photon Source (APS) have been performed using assets of the Argonne Wakefield Accelerator (AWA) facility. The short light pulses from the photoelectric injector drive laser in both the visible (λ=496 nm, Δt~1.5 ps (FWHM)), and the ultraviolet (λ=248 nm, Δt~5 ps (FWHM)) were used. Both a UV-visible S20 photocathode streak tube and a UV-to-x-ray Au photocathode streak tube were tested. Calibration data with an etalon were also obtained. A sample of dual-sweep streak data using optical synchrotron radiation on the APS injector synchrotron is also presented.

24158 (ANL/ASD/CP–84989) **Preliminary calculations on the determination of APS particle-beam parameters based on undulator radiation.** Lumpkin, A. (Argonne National Lab., IL (United States)); Yang, B.; Chung, Y.; Dejus, R.; Voykov, G.; Dattoli, G. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–251: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013776. Source: OSTI; NTIS; INIS; GPO Dep.

The potential measurement of particle beam emittance at a third-generation synchrotron radiation facility such as the Advanced Photon Source (APS) by characterizing the observed undulator radiation from an insertion device is considered. The nominal APS particle beam parameters have been used in calculations for insertion devices which periods of λ=3.3 cm, λ=5.0 cm (in two configurations), and λ=1.8 cm. The US program, the MDK1F program, and analytical formulae were used. Sensitivity to variations of emittance by 20% from the nominal value are addressed.

24159 (ANL/ASD/CP–84990) **Initial diagnostics commissioning results for the Advanced Photon Source (APS).** Lumpkin, A. (and others); Patterson, D.; Wang, X. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–248: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013775. Source: OSTI; NTIS; INIS; GPO Dep.

Principal diagnostics systems have been installed and nearly all have been commissioned on the subsystems of the Advanced Photon Source (APS) facility. Data have been obtained on beam position, beam profile, current, beam loss rate, and synchrotron radiation monitors on both injector rings and most recently the main 7-GeV storage ring. Results for the 150- to 450-MeV electron beams in the accumulator ring, up to 7 GeV in the injector synchrotron, and 4.5 to 7 GeV in the SR will be presented.

24160 (ANL/ASD/CP–84991) **Status of the synchrotron radiation monitors for the APS facility rings.** Lumpkin, A.; Yang, B. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–206: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013527. Source: OSTI; NTIS; INIS; GPO Dep.

Initial results from the Optical synchrotron radiation (OSR) monitors for the Advanced Photon Source (APS) have been obtained. Data using electron beams on the positron accumulator ring (PAR) at 400 MeV, the injector synchrotron (IS) up to 7-GeV, and the main storage ring (SR) at 4.5 and 7 GeV address both transverse profiles and/or longitudinal bunch length. Recent measurements on OSR transported outside of the PAR and IS enclosures include transverse damping information. Streak camera and photodiode detectors have been used to measure bunch length compression σ_t = 1000 to 400 ps on the PAR and damping on the IS of σ_t = 200 to 75 ps. First transverse images have been recorded on the main ring from a single turn and for stored beam.

24161 (ANL/ASD/CP–84996) **Design and testing of a high power, ultra-high vacuum, dual-directional coupler for the Advanced Photon Source (APS) linear accelerator.** Brauer, S.O.; Grelick, A.E.; Grimmer, J.; Otocki, R.D.; Kang, Y.W.; Noonan, J.; Russell, T. Argonne National Lab., IL (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–245: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013770. Source: OSTI; NTIS; INIS; GPO Dep.

Leaks and cracks have developed in the vacuum windows of the linac WR 284 waveguide directional couplers. In the existing coupler design the vacuum window is brazed to the waveguide. Replacement of a cracked window requires the removal of the component from the waveguide system resulting in a loss of vacuum in the waveguide. A new design has been developed and a prototype tested that utilizes bolted-in vacuum windows and allows for easier replacement of the windows in the system, while still providing suitable radio frequency (rf) specifications.

24162 (ANL/ASD/CP–85007) **The APS direct-drive pulsed septum magnets.** Sheynin, S.; Lopez, F.; Milton, S.V. Argonne National Lab., IL (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–231: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013754. Source: OSTI; NTIS; INIS; GPO Dep.

The Advanced Photon Source (APS) consists of four separate machines: linac, booster, positron accumulator ring (PAR) and storage ring (SR), plus three transfer lines interconnecting the machines. At least one thin, pulsed septum magnet is located at each splice joint. The stray field tolerances for two of these septum magnets are very stringent. As an example, for clean operation during the proposed top-up mode in the storage ring, the stray fields from the septum magnet must not exceed 1 G-m. The septum wall thickness must also not exceed 2.4 mm. To meet these requirements, direct-drive septum magnets with magnetic shield pipe around the stored beam region were developed and built. These magnets have now been tested and installed, and are used in daily

operation. We describe the magnet(s) design, the measurement results, the actual operation, and performance.

24163 (ANL/ASD/CP–85009) **Bunch length measurements at the Advanced Photon Source (APS) linear accelerator.** Sereno, N.S.; Fuja, R.; Gold, C.; Grelick, A.E.; Nassiri, A.; Song, J.J.; White, M. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–235: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013756. Source: OSTI; NTIS; INIS; GPO Dep.

Measurements of the APS linac micro-bunch length are performed by backphasing a single 2856-MHz, S-band linac waveguide and using a downstream spectrometer to observe the beam. By measuring the beam width in the dispersive plane as a function of rf power into the linac waveguide, the bunch length can be determined absolutely provided the beam energy and dispersion at the spectrometer are known. The bunch length determined in this fashion is used to calibrate a fifth-harmonic bunch length cavity which is used for real-time bunch length monitoring.

24164 (ANL/ASD/CP–85010) **Commissioning of the Argonne positron accumulator ring.** Borland, M. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–234: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013753. Source: OSTI; NTIS; INIS; GPO Dep.

The Advanced Photon Source (APS) injector consists of a 250-MeV electron linac, a 450-MeV positron linac, a 450-MeV positron accumulator ring (PAR), and a 7-GeV synchrotron. The purpose of the PAR is to accumulate and damp positrons from the 60-Hz linac during each cycle of the 2-Hz synchrotron, thus increasing the fill rate for the main ring. This paper discusses the rapid progress of PAR commissioning. Less than a year was required from first acceptance of beam to transfer of PAR operations to the APS Operations Group. PAR has been well characterized and already meets most of its design specifications. An accurate model has been developed for linear and chromatic properties. Hardware improvements are planned to allow specifications to be fully met.

24165 (ANL/ASD/CP–85048) **Positron focusing in the Advanced Photon Source (APS) linear accelerator.** Qian, Y.L.; White, M. Argonne National Lab., IL (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–230: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013758. Source: OSTI; NTIS; INIS; GPO Dep.

Positrons are created by a bremsstrahlung shower process, and are therefore produced with broad divergence and a large energy spread. The e^+/e^- conversion ratio is on the order of 1/200, so the positron focusing system is critical to ensure good positron capture and transport efficiency. The positron focusing system is described, and functions of the different magnetic elements are discussed. Some improvements to the focusing system are suggested, although the linac's design positron intensity of 8 mA has already been achieved.

24166 (ANL/ASD/CP–85051) **Injecting a Kapchinskij-Vladimirskij distribution into a proton synchrotron.** Crosbie, E. (Argonne National Lab., IL (United States)); Symon, K. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–229: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013759. Source: OSTI; NTIS; INIS; GPO Dep.

Recently it has been suggested that the Kapchinskij Vladimirskij (KV) distribution may be of practical interest for high intensity machines in that it may provide the maximum space charge limit for such a machine. One can be make a plausible argument that the maximum beam intensity is obtained for a distribution for which all particles have the same tune, at least when the resonance is approached. Therefore, the following steps should be taken: first, reduce the chromaticity of the accelerator ring as much as possible, and second, make the betatron frequencies independent of amplitude, i.e., make the focusing forces linear. One way to make the focusing forces linear is to start with external focusing forces which are linear, and then make the space charge forces also linear by using a K-V distribution. Sections II and III describe two injection scenarios which produce a KV distribution (if we neglect beam-beam interactions during the injection process.) Simulations of these injection scenarios verify that the resulting distribution produces a uniform circular beam in xy-space. A simulation code was written which also includes the space charge interactions between the 500 injected turns in the proposed scenarios; the results are given in section IV. The space charge forces have a substantial effect on the resulting distribution.

24167 (ANL/ASD/CP–85056) **Advanced Photon Source insertion device field quality and multipole error specification.** Chae, Yong-Chul; Decker, G. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–227: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013761. Source: OSTI; NTIS; INIS; GPO Dep.

The Advanced Photon Source (APS) storage ring is a 7-GeV light source with forty straight sections. Intense x-ray beams will be delivered by insertion devices installed in these straight sections. Installation of insertion devices in the APS storage ring produces several effects which can degrade overall performance. Rigid ring performance requirements exist which can be used to set limits on insertion device field quality, i.e. the first- and second-field integrals of the transverse magnetic field. Individual multipole error specifications can be determined by considering the lifetime of the beam. For nominal operation of the APS storage ring, the vertical aperture corresponding to a 10-hour lifetime is approximately 3.35 mm, which limits the level of multipole error. We find that the skew-octupole error has the most significant effect on the reduction of the aperture; the reasons are discussed in this paper.

24168 (ANL/ASD/CP–85063) **Digital signal processing for the APS transverse and longitudinal damping system.** Barr, D.; Sellyey, W. Argonne National Lab., IL (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–242: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013779. Source: OSTI; NTIS; INIS; GPO Dep.

The Advanced Photon Source (APS) at Argonne National Laboratory will be a 7-GeV machine. It is anticipated that for beam operations beyond the baseline design of 100 mA stored beam current, a transverse and longitudinal damping system is needed to damp instabilities. A key part of this digital damping system is digital signal processing. This digital system will be used to process samples taken from the beam and determine appropriate correction values to be applied to the beam. The processing will take the form of a transversal digital filter with adaptable filter weights. Sampling will be done at 176 MHz with a possible correction bandwidth of 88 MHz. This paper concentrates on the digital processing involved in this system, and especially on the adaptive algorithms used for determining the digital filter weights.

24169 (ANL/ASD/CP–85065) **Implementation status of the global and local beam position feedback systems for the Advanced Photon Source storage ring.** Chung, Y.; Barr, D.; Decker, G.; Galayda, J.; Kirchman, J.; Lenkszus, F.; Lumpkin, A.; Votaw, A.J. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–220: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013780. Source: OSTI; NTIS; INIS; GPO Dep.

The Advanced Photon Source (APS) is implementing an extensive beam position feedback system for both global and local stabilization of particle and photon beams based on digital signal processing. The description and operational experience of the system will be given in this paper. In particular, we will discuss the underlying fundamental principles, hardware layout, controls interface, and automatic software generation for multiple digital signal processors (DSPS) distributed in 20 VME crates around the ring. The feedback system runs at 4-kHz sampling frequency in order to achieve the correction bandwidth of approximately 100 Hz. For the maximum correction efficiency and resolution of conflicts among

multiple local feedback systems due to the local bump closure error, the global and local feedback systems are combined into a single unified system. This novel approach is made possible through data sharing among the global and local systems via the fiber-optically networked reflective memories.

24170 (ANL/ASD/CP–85097) **Performance of the advanced photon source (APS) linac beam position monitors (BPMs) with logarithmic amplifier electronics.** Fuja, R.E.; White, M. Argonne National Lab., IL (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–239: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013782. Source: OSTI; NTIS; INIS; GPO Dep.

This paper discusses the performance of the logarithmic amplifier electronics system used with stripline BPMs to measure electron and positron beam positions at the APS linac. The 2856-MHz, S-band linac accelerates 30-nsec pulses of 1.7 A of electrons to 200 MeV, and focuses them onto a positron conversion target. The resulting 8 mA of positrons are further accelerated to 450 MeV by the positron linac. Beam position resolutions of 50 μm are easily obtainable in both the electron and positron linacs. The resolution of the 12-bit A/D converters limits the ultimate beam positron resolution to between 20 and 30 μm at this time.

24171 (ANL-HEP-CP–95-35) **Witness gun for the Argonne Wakefield Accelerator.** Power, J.; Simpson, J.; Chojnacki, E.; Konecny, R. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950512–182: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013491. Source: OSTI; NTIS; INIS; GPO Dep.

The witness gun for the Argonne Wakefield Accelerator (AWA) is a six-cell, copper, iris loaded, rf photocathode operating at 1.3 GHz in a $\pi/2$ standing wave mode. An intense drive beam (up to 100 nC @ 20 psec FWHM) used in the AWA project to excite (i.e. drive) wakefields in at least two separate test devices: a dielectric loaded cylindrical waveguide and a plasma cell. In both cases a low charge, low emittance witness beam (0.1 nC charge, 1 πmm-mrad 90% physical emittance) is required to probe (i.e. witness) the wakefields left behind by the drive beam. This paper will primarily discuss the recent progress in the construction of the witness gun, while also briefly summarizing the central design issues of the gun. A brief status report on the dielectric witness gun option is also included. The authors conclude with a short statement on the near term future plans.

24172 (ANL/PHY/CP–85353) **A low-charge-state injector linac for ATLAS.** Shepard, K.W.; Kim, J.W. Argonne National Lab., IL (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–241: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013785. Source: OSTI; NTIS; INIS; GPO Dep.

The design of a low-charge-state linac which is capable of accelerating, for example, $^{132}Sn^{1+}$ for injection into the existing heavy-ion linac ATLAS is discussed. The injector linac is intended for radioactive beam applications, and will accelerate a low-charge-state beam to energies of 500 keV/nucleon, at which point the ions can be stripped to charge states sufficiently high to be injected into ATLAS. A primary design goal has been to extend the very good longitudinal beam quality typical of ATLAS to low charge state beams. The proposed injector linac consists of several elements. First is a gridded-gap four-harmonic buncher and a short (normally-conducting) 12 MHz RFQ structure, both operating on a 350 kV open-air variable-voltage platform. Then comes an array of 24 Mhz and 48 Mhz superconducting interdigital accelerating structures interspersed with superconducting quadrupole transverse focusing elements. Numerical ray-tracing studies indicate that a transverse acceptance greater than 0.25π mm-mrad can be obtained while simultaneously limiting longitudinal emittance growth to a very few keV-nsec.

24173 (ANL/PHY/CP–85355) **A low-cost non-intercepting beam current and phase monitor for heavy ions.** Bogaty, J.M.; Clifft, B.E. Argonne National Lab., IL (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–236: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013757. Source: OSTI; NTIS; INIS; GPO Dep.

A low cost ion beam measurement system has been developed for use at ATLAS. The system provides nondestructive phase and intensity measurement of passing ion beam bunches by sensing their electric fields. Bunches traverse a short tubular electrode thereby inducing displacement currents. These currents are brought outside the vacuum jacket where a lumped inductance resonates electrode capacitance at one of the bunching harmonic frequencies. This configuration yields a basic sensitivity of a few hundred millivolts signal per microampere of beam current. Beam induced radiofrequency signals are summed against an offset frequency generated by the master oscillator. The resulting difference frequency conveys beam intensity and bunch phase information which is sent to separate processing channels. One channel utilizes a phase locked loop to stabilize phase readings during microsecond beam drop outs. The other channel uses a linear full-wave active rectifier circuit which converts sine wave signal amplitude to a DC voltage representing beam current. Plans are in progress to install this new diagnostic at several locations in ATLAS which should help shorten the tuning cycle of new ion species.

24174 (ANL/PHY/CP–86550) **A high gradient superconducting quadrupole for a low charge state ion linac.** Kim, J.W.; Shepard, K.W.; Nolen, J.A. Argonne National Lab., IL (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–250: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013777. Source: OSTI; NTIS; INIS; GPO Dep.

A superconducting quadrupole magnet has been designed for use as the focusing element in a low charge state linac proposed at Argonne. The expected field gradient is 350 T/m at an operating current of 53 A, and the bore diameter is 3 cm. The use of rare earth material holmium for pole tips provides about 10% more gradient then iron pole tips. The design and the status of construction of a prototype singlet magnet is described.

24175 (ANL/TD/CP–85060) **Generation of high purity cw proton beams from microwave driven sources.** Spence, D.; Lykke, K.R. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–244: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013769. Source: OSTI; NTIS; INIS; GPO Dep.

We describe a technique we have developed to significantly increase the proton fraction extracted from high pressure (mTorr) electron cyclotron resonance (ECR) sources of the type developed by Chalk River Laboratories (CRL). Specifically, this proton enhancement is achieved by the addition of environmentally benign additives (H_2O being the most effective) to the plasma, in molecular concentrations of the order of 1%. Typically, operating under non- resonant source conditions, this technique will enhance the proton fraction from about 75% to greater than 95% for a power input of 700W at 2.45 GHz. Similar results are achieved for deuteron beams. We believe this technique is capable of similar results in arc-discharge (bucket) sources, Penning sources and any other gas discharge sources, under suitable conditions.

24176 (ANL/XFD/CP–85084) **Results of magnetic measurements and field integral compensation for the Elliptical Multipole Wiggler.** Frachon, D.; Ivanov, P.M.; Medvedko, E.A.; Vasserman, I.; Despe, O.; Kang, Y.G. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–172: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013414. Source: OSTI; NTIS; GPO Dep.

A prototype of the Elliptical Multipole Wiggler (EMW) has been assembled, tested and tuned at the APS. This prototype has a period of 160 mm with 7 poles for the hybrid structure and 10 poles for the electromagnet part of the EMW. The hybrid structure of the EMW produces a vertical maenetic field of 0.83 T with K_y= 12 for a

cap of 27 mm, and the electromagnetic structure provides a horizontal field chancre up to 100 Hz with a maximum field of 0.12 T (I= 0.6 kA, K_x= 1.6). The current pulse has a trapezium-type shape with a switching time to chancre the current polarity of about 2 ms. The measurements and tuning, were done for direct current (DC) mode and alternating current (AC) mode. Fine adjustment during the test at the NSLS X-ray ring, using the BPMs and active correction system allowed to achieve about 1 μm of beam distortion. It corresponds to the peak-to-peak variations during, the time less than $\pm$0.5 G-cm and $\pm$100 G-cm^2 of the first and second horizontal field integrals respectively.

24177 (ANL/XFD/CP–86468) **The vacuum system for insertion devices at the Advanced Photon Source.** Trakhtenberg, E.; Gluskin, E.; Den Hartog, P.; Klippert, T.; Wiemerslage, G.; Xu, S. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-950512–243: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013767. Source: OSTI; NTIS; INIS; GPO Dep.

A vacuum system for the insertion devices at the Advanced Photon Source was designed, and chambers of this design were successfully manufactured and tested. Three different versions of the vacuum chamber have been developed with vertical apertures of 12 mm, 8mm, and 5 mm, respectively. The chambers are fabricated by extruding 6063 aluminum alloy to form a tube with the desired internal shaped and machining the exterior to finish dimensions. The wall thickness of the completed chamber at the beam orbit position is 1 mm. The design utilizes a rigid strongback that limits deflection of the chamber under vacuum despite the thin wall. Chambers with lengths of 2.2m and 5.2 m have been fabricated. Pumping is accomplished by a combination of lumped and distributed non-evaporable getters and ion pumps. An ultimate pressure of $5.1 \cdot^{-11}$ torr was achieved with the 12-mm vertical aperture prototype. Alignment of the vacuum chamber on its support can be made with a precision of $\pm$ 25 μm in the vertical plane, which allows minimum insertion device pole gaps of 14.5 mm, 10.5 mm, and 7.5 mm.

24178 (APS–3.3.2.1.0) **Advanced Photon Source experimental beamline Safety Assessment Document: Addendum to the Advanced Photon Source Accelerator Systems Safety Assessment Document (APS-3.2.2.1.0).** Argonne National Lab., IL (United States). Jan 1995. 102p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95013557. Source: OSTI; NTIS; INIS; GPO Dep.

This Safety Assessment Document (SAD) addresses commissioning and operation of the experimental beamlines at the Advanced Photon Source (APS). Purpose of this document is to identify and describe the hazards associated with commissioning and operation of these beamlines and to document the measures taken to minimize these hazards and mitigate the hazard consequences. The potential hazards associated with the commissioning and operation of the APS facility have been identified and analyzed. Physical and administrative controls mitigate identified hazards. No hazard exists in this facility that has not been previously encountered and successfully mitigated in other accelerator and synchrotron radiation research facilities. This document is an updated version of the APS Preliminary Safety Analysis Report (PSAR). During the review of the PSAR in February 1990, the APS was determined to be a Low Hazard Facility. On June 14, 1993, the Acting Director of the Office of Energy Research endorsed the designation of the APS as a Low Hazard Facility, and this Safety Assessment Document supports that designation.

24179 (BNL–61362) **Skew quadrupole in RHIC dipole magnets at high fields.** Jain, A.; Gupta, P.; Thompson, P.; Wanderer, P. Brookhaven National Lab., Upton, NY (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950691–5: 14. international conference on magnet technology, Tampere (Finland), 11-16 Jun 1995). Order Number DE95015370. Source: OSTI; NTIS; INIS; GPO Dep.

In the RHIC arc dipoles, the center of the cold mass lies above the center of the cryostat. At the maximum design field, the magnetic flux lines leak through the yoke to the asymmetrically located cryostat, which provides an additional return path. This introduces a systematic top-bottom asymmetry leading to a skew quadrupole term at high fields. A similar asymmetry is also created by any difference in weights of the upper and the lower yoke halves. Data from measurements of several RHIC dipoles are presented to study this effect. In the current production series of the RHIC dipoles, an attempt is made to compensate the effect of the cryostat by an asymmetry in the iron yoke. Seven dipoles with this type of yoke have been cold tested, and show a reduced saturation in the skew quadrupole term, as expected.

24180 (BNL–61777) **Quench antennas for RHIC quadrupole magnets.** Ogitsu, T. (National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan)); Terashima, A.; Tsuchiya, K.; Ganetis, G.; Muratore, J.; Wanderer, P. Brookhaven National Lab., Upton, NY (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950512–141: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011816. Source: OSTI; NTIS; INIS; GPO Dep.

Quench antennas for RHIC quadrupole magnets are being developed jointly by KEK and BNL. A quench antenna is a device to localize a quench origin using arrays of pick-up coils lined up along the magnet bore. Each array contains four pick-up coils: sensitive to normal sextupole, skew sextupole, normal octupole, and skew octupole field. This array configuration allows an azimuthal localization of a quench front while a series of arrays gives an axial localization and a quench propagation velocity. Several antennas have been developed for RHIC magnets and they are now routinely used for quench tests of production magnets. The paper discusses the description of the method and introduces a measured example using an antenna designed for quadrupole magnets.

24181 (BNL–61850) **Transition radiation electron beam diagnostic study at ATF.** Qiu, X.Z.; Wang, X.J.; Batchelor, K.; Ben-Zvi, I. Brookhaven National Lab., Upton, NY (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950512–163: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013232. Source: OSTI; NTIS; INIS; GPO Dep.

Recently we have started a program to develop transition radiation based electron beam diagnostics at the Accelerator Test Facility at Brookhaven National Laboratory. In this paper, we will discuss a technique to estimate the lower limit in electron beam divergence measurement with single foil transition radiation and two-foil transition radiation interferometer. Preliminary experimental data from 4.5 MeV electron beam will be presented.

24182 (BNL–61859) **ATF CO_2 laser system upgrade to terawatt peak power.** Pogorelsky, I.V. Brookhaven National Lab., Upton, NY (United States). May 1995. 84p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95013592. Source: OSTI; NTIS; GPO Dep.

This document describes the proposed upgrade of the 10-GW peak power 50-ps CO_2 laser presently operational at the ATF to the 1 TW level at a shorter, 3–10 ps, pulse duration. The approach adopted is based on state of the art CO_2 laser technology and an experience gained in the course of the ATF laser design and application for the laser accelerator experiment. The proposed upgrade is an economical way for the ATF to become in a short time among leading users facilities available for next generation ($\geq$ 100 MeV) laser accelerator studies.

24183 (BNL–61920) **Hybrid helical snakes and rotators for RHIC.** Courant, E.D. Brookhaven National Lab., Upton, NY (United States). 13 Jun 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (AD/RHIC–133). Order Number DE95014551. Source: OSTI; NTIS; GPO Dep.

The spin rotators and Siberian snakes presently envisaged for RHIC utilize helical dipole magnets. The snakes and the rotators each consist of four helices, each with a full twist (360°) of the field. Here we investigate an alternate layout, namely combinations of helical and pure bending magnet, and show that this may have advantages.

24184 (CONF-661021–1) **Optimization criteria for standing wave transverse magnetic deflection cavities.** Haimson, J. (Massachusetts Institute of Technology, Cambridge, MA (United States)). Haimson Research Corp., Santa Clara, CA (United States). [1995]. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-94ER81775. From Linear accelerator conference; Los Alamos, NM (United States); 3-7 Oct 1966. Order Number DE95016114. Source: OSTI; NTIS; GPO Dep.

An important linear accelerator requirement, in order to demonstrate narrow energy spectra, is the injection of electron bunches of narrow phase spread and negligible inter-bunch current. This can be achieved by r-f transverse modulation and clipping of the beam by an aperture prior to injection into the accelerator waveguide, i.e., chopper operation. By magnetically biasing the beam to one side of the centerline, it is possible to arrange for transmission into the accelerator at a time during each r-f cycle when the radial momentum imparted to the beam by the chopper cavity is passing through zero. The low efficiency of beam utilization normally associated with this type of operation, because of the high ratio of collected to transmitted current, can be considerably improved by combining the transverse chopping action with a suitably phased longitudinal velocity modulating field as obtained from a simple prebunching cavity. Transverse r-f deflection techniques also enable sub-harmonic bunch selection and injection into linear accelerators which are used as injectors for electron synchrotrons. This is achieved by driving the chopper cavity at the same frequency as the synchrotron r-f system (which is maintained at a precise submultiple of the linear accelerator fundamental frequency) and then prebunching the chopped beam at the fundamental frequency prior to injection into the linear accelerator.

24185 (FNAL/C–95/118) **Fermilab DART run control.** Oleynik, G. (and others); Engelfried, J.; Mengel, L. Fermi National Accelerator Lab., Batavia, IL (United States). May 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-950534–3: Conference on real-time computer applications in nuclear, particle and plasma physics (RT), East Lansing, MI (United States), 22-26 May 1995). Order Number DE95014662. Source: OSTI; NTIS; INIS; GPO Dep.

DART is the high speed, Unix based data acquisition system being developed by Fermilab in collaboration with seven High Energy Physics Experiments. This paper describes DART run control, which has been developed over the past year and is a flexible, distributed, extensible system for the, control and monitoring of the data acquisition systems. We discuss the unique and interesting concepts of the run control and some of our experiences in developing it. We also give a brief update and status of the whole DART system.

24186 (FNAL/C–95/143) **Flatcoil systems for measurements of Fermilab magnets.** Glass, H.D. (and others); Brown, B.C.; DiMarco, J. Fermi National Accelerator Lab., Batavia, IL (United States). Jun 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-950691–2: 14. international conference on magnet technology, Tampere (Finland), 11-16 Jun 1995). Order Number DE95014205. Source: OSTI; NTIS; GPO Dep.

A flux measurement system has been developed for measuring the integrated strength and relative shape of the magnetic field of Fermilab Main Injector dipoles. Improved field shape measurements have been obtained by constructing coil geometries which reduce the flux contribution from unwanted field derivatives. A bucking coil scheme employing reference coils in both the test magnet and a reference magnet reduce the sensitivity to power supply fluctuations. Design strategies for various measurement requirements are described, along with the details of implementing an assembly to measure curved 6 m and 4 m dipoles. Some representative results and comparison with redundant measurement systems are presented.

24187 (FNAL/C–95/170) **Design of a secondary-vertex trigger system.** Husby, D. (Fermi National Accelerator Lab., Batavia, IL (United States)); Chew, P.; Sterner, K.; Selove, W. Fermi National Accelerator Lab., Batavia, IL (United States). Jun 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9505248–1: LeCroy conference on electronics for particle physics, Chestnut Ridge, NY (United States), May 1995). Order Number DE95014661. Source: OSTI; NTIS; INIS; GPO Dep.

For the selection of beauty and charm events with high efficiency at the Tevatron, a secondary-vertex trigger system is under design. It would operate on forward-geometry events. The system would use on-line tracking of all tracks in the vertex detector, to identify events with clearly detached secondary vertices.

24188 (FNAL-TM–1937) **Magnetic fields and scintillator performance.** Green, D. (Fermi National Accelerator Lab., Batavia, IL (United States)); Ronzhin, A.; Hagopian, V. Fermi National Accelerator Lab., Batavia, IL (United States). Jun 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE95014659. Source: OSTI; NTIS; INIS; GPO Dep.

Experimental data have shown that the light output of a scintillator depends on the magnitude of the externally applied magnetic fields, and that this variation can affect the calorimeter calibration and possibly resolution. The goal of the measurements presented here is to study the light yield of scintillators in high magnetic fields in conditions that are similar to those anticipated for the LHC CMS detector. Two independent measurements were performed, the first at Fermilab and the second at the National High Magnetic Field Laboratory at Florida State University.

24189 (JINR-D–9-92-455, pp. 58-59) **Control system of high-current resonance electron linac for radiation technologies.** Ajzatskij, N.I. (Khar'kovskij Fiziko-Tekhnicheskij Inst, Kharkov (Ukraine)); Akchurin, Yu.I.; Bakhmet'ev, N.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The on-line control system of the 8 - 10 MeV resonance electron accelerator having beam average power of 2 kw is described. The on-line control system consists of the P C/AT-286 computer equipped with the CAMAC data way, microprocessor complex controlling klystron amplifier, thermostatic system, synchronization unit and a set of equipment interfaces. The program package providing accelerator control is being developed using the Si programming language. 1 ref., 2 figs.

24190 (JINR-D–9-92-455, pp. 60-62) **Automated control system of the MKM-21 multipurpose microtron.** Alekseev, I.V. (Saratovskij Gosudarstvennyj Univ., Saratov (Russian Federation)); Balaev, A.Yu.; Vishnevskij, A.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

On-line control system of the MKM-21 multipurpose microtron having beam current of 10 - 20 μA and energy of 14 - 21 MeV is described. Manual operation and on-line regimes are foreseen in the system. The equipment interface provides the communication between the radiator, power supply, the manual control console and the computer. The interface comprises 64-channel, 16-bit parallel interface and is manufactured on the base of microcircuits. The console has widely-developed system of visual control of accidents and operation condition of the main accelerator systems. The major parameters of the accelerator are given. 2 figs., 1 tab.

24191 (JINR-D–9-92-455, pp. 63-66) **Fast monitoring and control system of two-dimensional current distribution along proton beam profile.** Tron', A.M. (Moskovskij Inzhenerno-Fizicheskij Inst., Moscow (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The system designed for operative measurement and control of two-dimensional current distribution along proton beam cross-section of the Moscow meson factory is described. The principle of operation of beam monitor consists of measuring two-dimensional distribution of secondary electrons produced in interaction of controlling beam with a set of thin emitters which are 10 μm tantalum foil strips. The control system comprises 64-channel analog signal commutator with an integrator at the input, power supply units, the CAMAC on-line measurement and control system and the IBM P C/286 microcomputer. 6 refs., 5 figs.

24192 (JINR-D–9-92-455, pp. 67-73) **Precise drive for the electron-positron linear collider elements positioning system.** Balakin, V.E. (RAN Sibirskoe Otdelenie, Inst Yadernoj Fiziki im. G.I.Budkera, Novosibirsk (Russian Federation)); Valyaev, Yu.D.; Kolmagorov, A.V.; Krasnonosen'kikh, D.P.; Leont'evskaya, L.G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The drive designed for linear collider elements positioning and stabilization is described and basic characteristics of the system are given. The positioning accuracy equals 1 nm. The scheme of beam position monitor is presented. The beam monitor is an alternating voltage induction engine. 6 figs.

24193 (JINR-D–9-92-455, pp. 74-77) **Programming of applied problems in the ITEP accelerating complex control system.** Alekseev, N.N. (Inst Teoreticheskoj i Ehksperimental'noj Fiziki, Moscow (Russian Federation)); Rybakov, A.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The concept of organization of software of the ITEP accelerator complex distributed control system is described. Software and hardware have modular structure and may be modified according to operating conditions and problems to be solved. The problem of orbit correction in the U-70 is considered as an example. 7 refs.

24194 (JINR-D–9-92-455, pp. 93-98) **Precise measurement of electromagnetic fields in accelerating structures.** Vorogushin, M.F. (Nauchno-Issledovatel'skij Inst Ehlektrofizicheskoj Apparatury im. D.V.Efremova, Sankt-Peterburg (Russian Federation)); Chernogubovskij, M.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Electron-optical technique of measurement of spatial distribution of electromagnetic field in cavity resonators of accelerating structures is suggested. The given technique allows one to reduce errors due to perturbed body displacement device, to fix field axial asymmetry with the accuracy of micrometer units. Application of the balance method (where actual read-out of field values is absent) for structures with quadrupole focusing at a frequency of 433 MHz provides the determination efficiency and modulation period accuracy within units and fraction of percents. 3 refs., 1 fig.

24195 (JINR-D–9-92-455, pp. 99-101) **Multifunctional measuring device of linear collider beam transverse parameters.** Shestak, V.P. (Moskovskij Inzhenerno-Fizicheskij Inst., Moscow (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Possibilities of using an electron-beam probing method for measuring electron and positron beams profiles and position in linear collider are investigated. It is shown that application of a microchannel electron multiplier which resolution is 20×10^{-6} m as a position sensitive detector and an ion beam as a monitor makes it possible to attain the resolution of 2×10^{-8} m within the bunch. 5 refs., 1 fig.

24196 (JINR-D–9-92-455, pp. 102-104) **On-line measurement system for detailed investigation of evolution of the MMF linear accelerator beam parameters.** Bragin, C.E. (RAN, Inst Yadernykh Issledovanij, Moscow (Russian Federation)); Il'inskij, N.G.; Mirzoyan, A.N.; Rejngardt-Nikulin, P.I.; Senichev, Yu.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The description and test results of the on-line system designed for measuring Moscow meson factory proton beam parameters are presented. It is shown, that using calibration tables the beam profile restoration accuracy of $\approx$ 2 - 3%. Results of investigating the profile evolution of 750 keV beam showed the beam center displacement in the transport channel attaining the order of 1 mm. 4 refs., 3 figs.

24197 (JINR-D–9-92-455, pp. 112-115) **U-400 M cyclotron magnetic deflectors based beam extraction system.** Akishin, P.G. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Borisov, O.N.; Gul'bekyan, G.G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Calculation results of the system designed for ion beam extraction from the U-400 M isochronous cyclotron are presented. The design of magnetic deflectors is described and magnetic field distribution in deflectors are shown. The first deflector is used for beam deflection and the rest of them are used for beam shaping during beam transport up to the beam transport system. 3 refs., 2 tabs., 6 figs.

24198 (JINR-D–9-92-455, pp. 116-117) **Ion beam extraction from the U-400 M cyclotron using charge exchange.** Borisov, O.N. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Gul'bekyan, G.G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Calculation results of ion beam extraction from the U-400M cyclotron by means of ion charge exchange on a foil are presented. The given technique allows the extraction of practically full beam, moreover, it is possible to attain higher intensity at the expanse of the increase of accelerating beam phase range up to 40 deg. 5 refs., 3 figs.

24199 (JINR-D–9-92-455, pp. 142-146) **Separation channel of radioactive nuclei.** Kapustin, A.A. (Nauchno-Issledovatel'skij Inst Ehlektrofizicheskoj Apparatury im. D.V.Efremova, Sankt-Peterburg (Russian Federation)); Kokorin, A.M.; Mud'yugin, B.G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The scheme of an ion-optical channel (IOCh) based on the U-240 cyclotron is considered. The IOCh is designed for the production of radioactive nuclei having high intensity and high degree of separation from background nuclei. Two-stage scheme comprising an analyzing magnet and an electrostatic separator is used for separating main isotopes nuclei. The IOCh provides ion transport with angular $\pm$ 1 deg and momentum spread of $\pm$ 2%. The transport channel with analyzing magnet designed for cyclotron beam

monochromatization is used as a first stage for separating some radioactive nuclei. 3 figs.

24200 (JINR-D–9-92-455, pp. 150-152) **Polarized ion injection into the U-120 cyclotron.** Olejnik, E.E. (Akademiya Nauk Ukrainy, Inst Yadernykh Issledovanij, Kiev (Ukraine)); Bezruk, A.I.; Bykov, V.I.; Grantsev, V.I.; Magal', M.I.; Pashin, V.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Results of calculation of a channel designed for polarized ion injection into the U-120 cyclotron are presented. Calculations based on using the TRANSPORT computer code showed the possibility of polarized beam transport without application of the Win's filter. For the given case the value of beam polarization degree for the central trajectory practically coincides with the initial one. 2 refs., 1 fig.

24201 (JINR-D–9-92-455, pp. 173-177) **Experimental study on a cm-wave range power pulse magnicon.** Zapryagaev, I.A. (RAN Sibirskoe Otdelenie, Inst Yadernoj Fiziki im. G.I.Budkera, Novosibirsk (Russian Federation)); Kazarezov, I.V.; Kozyrev, E.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The description and test results of a cm-wave range power pulse microwave source-magnicon-frequency doubler designed for an electron gun of a linear collider are presented. In the given scheme of the magnicon the gap which is free from guiding magnetic field between the output resonator and the scanner is absent. Magnetic system is an armour solenoid comprising eight similar water-cooled coils. 3 refs., 2 tabs., 2 figs.

24202 (JINR-D–9-92-455, pp. 178-182) **Development and performance testing of elements of power RF systems of linear electron-positron colliders.** Avrakhov, P.V. (RAN Sibirskoe Otdelenie, Inst Yadernoj Fiziki im. G.I.Budkera, Novosibirsk (Russian Federation)); Adarich, I.N.; Arapov, L.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The description of a five-meter module of a linear accelerator designed for a linear collider which is under development is presented. Test results of separate systems of the module are given. 9 refs., 1 tab., 4 figs.

24203 (JINR-D–9-92-455, pp. 183-186) **Performance testing of RF system elements of a racetrack microtron recuperator.** Arbuzov, V.S. (Zavod 'Komsomolets', Tambov (Russian Federation)); Belomestnykh, S.A.; Bushuev, A.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The racetrack microtron - the continuous action recuperator designed for a free-electron laser is under development in the Novosibirsk Institute for Nuclear Physics. The designed electron energy is 45 MeV, average beam current is 0.1 A. 21 resonators (with peak accelerating voltage of 800 kw and RF-generators with total power of about 2 MW) are planned to be applied in the microtron RF-systems. Accelerating cavity resonator and the 181 MHz RF-generator cascades have been developed and tested at a high power level and the steady-state conditions of operation. 4 refs., 1 tab., 2 figs.

24204 (JINR-D–9-92-455, pp. 195-200) **Present status on superconducting cavity resonators at the Institute for High Energy Physics.** Sevryukova, L.M. (Institut Fiziki Vysokikh Ehnergij, Protvino (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The main directions and results of investigating the development and the fabrication of superconducting cavity resonators for the IHEP charged particle accelerators are outlined in brief. The description of technological equipment designed for investigating superconducting cavity resonators is presented. 8 refs.

24205 (JINR-D–9-92-455, pp. 201-204) **Regotron - powerful RF generator with distributed power takeoff system.** Murin, B.P. (RAN, Moskovskij Radiotekhnicheskij Inst, Moscow (Russian Federation)); Bondarev, B.I.; Durkin, A.P.; Shlygin, O.Yu.; Shumakov, I.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The high-power 'Regotron'-type microwave generator providing the production of 5 - 10 MW power in continuous mode of operation with efficiency of 70 - 60% is described. The expediency of using the 'Regotron' for supplying the high-power accelerator with high average beam current designed for operation as a barn-reactor to solve the problem of transmutation of long-lived radionuclides formed during nuclear power plant operation is shown. The characteristics of the 'Regotron' operating at a frequency of 991 MHz are presented. 5 refs., 1 tab., 2 figs.

24206 (JINR-D–9-92-455, pp. 205-207) **New modifications of corrugated waveguides for acceleration of short-pulse electron beams.** Ajzatskij, N.I. (Khar'kovskij Fiziko-Tekhnicheskij Inst, Kharkov (Ukraine)); Biller, E.Z.; Dovbnya, A.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The structure of corrugated waveguides where one of the travelling wave spatial harmonic is in a synchronism with charged particles is described. The given structure is designed for a short-pulse accelerator with total charge in electron bunch of 500 nC. Modifications of these structures are described. Results of performance testing of accelerating sections based on these structures are given. 4 refs.

24207 (JINR-D–9-92-455, pp. 208-211) **Project of RF-system for the TsPR-144 cyclotron for applied purposes.** Sakhno, V.I. (Inst Yadernykh Issledovanij Ukrainy, Kiev (Ukraine)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The description of a three-resonator RF-system of the TsPR-144 cyclotron designed for applied purposes is given. An accelerating section comprising an RF valve oscillator with the self-excitation and a cavity resonator is the base element of the system. Three accelerating sections are designed for the acceleration rate of up to 0.3 MeV/revolution. 7 refs., 2 figs.

24208 (JINR-D–9-92-455, pp. 212-215) **Status on batch production of VLEhPP accelerating sections.** Balakin, V.E. (RAN Sibirskoe Otdelenie, Filial Instituta Yadernoj Fiziki im. G.I.Budkera, Protvino (Russian Federation)); Solyak, N.A.; Arapov, L.N.; Gosteev, V.K.; Dolgashev, V.A.; Kosarev, A.N.; Kuklin, D.E.; Minkov, A.V.; Shemelin, V.D.; Manokhin, V.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian).

(CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Status of the industrial production of linear collider accelerating sections with operating frequency of 14 GHz and acceleration rate of 100 MeV/m is described. Requirements for the accuracy of manufacturing of accelerating sections are determined. The shaping lathe is developed. The technology of section connection is found. 4 refs., 2 figs.

24209 (JINR-D–9-92-455, pp. 216-218) **Tuning of transition cells of piece-homogeneous accelerating structures.** Ajzatskij, N.I. (Khar'kovskij Fiziko-Tekhnicheskij Inst, Kharkov (Ukraine)); Biller, E.Z.; Dovbnya, A.N.; Kushnir, V.A.; Mitrochenko, V.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Results of theoretical study on characteristics of different methods of matching corrugated piece-uniform waveguide accelerating structures are presented. It is shown, that the length of symmetrical matching cells must be equal to $\lambda/4$. When using nonsymmetric transition cells, their tuning must be performed for their inner diameter. 9 refs.

24210 (JINR-D–9-92-455, pp. 219-222) **Study on beam instability in 10 cm power klystron amplifiers.** Balakin, V.E. (RAN Sibirskoe Otdelenie, Filial Instituta Yadernoj Fiziki im. G.I.Budkera, Protvino (Russian Federation)); Teryaev, V.E.; Chashurin, V.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Results of experimental study on parameters of microwave power supplies of electron linacs are presented. It is shown that the effect of RF-signal shortening is due to beam break-up in the beam bunching system which is the consequence of beam resonance interaction with nonsymmetric waves exciting in the system at the frequency range of 5.4 GHz. 5 refs., 3 figs.

24211 (JINR-D–9-92-455, pp. 223-225) **Influence of longitudinal focusing magnetic field direction on klystron output power.** Moiseev, V.I. (Rossijskij Nauchnyj Tsentr Kurchatovskij Inst, Moscow (Russian Federation)); Petrenko, V.V.; Smirnov, V.N.; Berezhnoj, V.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The study on microwave field axial asymmetry introduced by a coupling element in the klystron resonators is done. It is shown, that focusing magnetic field should be optimized both in the value, and in its direction during klystron tuning for the operation made. 1 ref.

24212 (JINR-D–9-92-455, pp. 226-227) **SHF-power supply auto generator system of a small-sized sector microtron (project).** Vladimirov, N.V. (Saratovskij Gosudarstvennyj Univ, Saratov (Russian Federation)); Gorbachev, V.P.; Stepanchuk, V.P.; Spirin, L.A.; Sherudilo, V.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Status of the development of an auto generator system of an RF-power supply of a sector microtron with an accelerating structure in a feedback circuit is described. The auto generator system comprises the matched load, the accelerating structure, the waveguide tee, the amplitron and the short-circuit plunger. The designed over dimensions of the system are as follows: 0.8 x 0.6 x 0.5 m. 1 ref., 1 fig.

24213 (JINR-D–9-92-455, pp. 228-231) **Investigations of superconducting resonators at the Institute for Nuclear Research RAN.** Balitskij, V.A. (RAN, Inst Yadernykh Issledovanij, Troitsk (Russian Federation)); Berezhnoj, V.A.; Gorbul', V.P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Results of the calculation of electrodynamic characteristics of superconducting resonators and higher-type oscillations dampers designed for electron linacs are presented. Estimated values necessary for resonator tuning for operation frequency are given. The first stage of the development of a superconducting resonator cryogenic system is described. The estimated length of a cooling structure is 0.7 m. 5 refs., 1 fig.

24214 (JINR-D–9-92-455, pp. 232-235) **On thermal stability of superconducting resonator.** Kurakin, V.G. (Fizicheskij Inst im. P.N.Lebedeva, Moscow (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

An attempt to solve the analytical problem of superconducting resonator thermal stability is made. The instability criteria are obtained using the joint solution of the heat conduction equation and the resonator excitation equation in the framework of a linear approximation. 9 refs.

24215 (JINR-D–9-92-455, pp. 236-238) **Complex of equipment for manufacturing and treatment of Nb/Cu based superconducting resonators.** Alimov, V.V. (Institut Fiziki Vysokikh Ehnergij, Protvino (Russian Federation)); Romamenko, V.E.; Sevryukova, L.M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The technology of the fabrication of superconducting resonators on the base of copper matrices free from welded joints obtained using galvanoplastic molding with the following niobium coating applied by means of magnetron sputtering is described. 3 refs., 4 figs.

24216 (JINR-D–9-92-455, pp. 239-241) **Methods of technological control during manufacturing of superconducting resonators.** Bazhenov, A.V. (Institut Fiziki Vysokikh Ehnergij, Protvino (Russian Federation)); Matveeva, O.V.; Pesterev, S.M.; Sevryukova, L.M.; Shapovalov, Yu.S. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Methods of technological control during manufacturing and processing superconducting resonators are described. Acoustic emission method is used for the control of copper matrices fabrication. 8 refs.

24217 (JINR-D–9-92-455, pp. 242-244) **Superconducting acceleration RF-structure with longitudinal detachable joints.** Sokolov, B.A. (Nauchno-Issledovatel'skij Inst Ehlektrofizicheskoj apparatury im. D.V.Efremova, Sankt-Peterburg (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged*

particle accelerators. Volume 1. Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The design variant of a three-sector superconducting RF-structure with longitudinal detachable joints is described. The structure comprises one top sector and two side sectors with autonomous helium baths separated with vacuum gaps. The structure is placed in a high-vacuum container placed on the supports. The possibility of the increase of limiting current of a charged particle beam accelerated at the given structures is shown. The variation of the gap size between sectors allows on to perform coarse tuning of the structure and there is the possibility of direct access to working surface. 5 refs., 3 figs.

24218 (JINR-D–9-92-455, pp. 245-248) **Coefficient of a field over intensity on the surface of a corrugated waveguide.** Ermilov, Eh.A. (Moskovskij Inzhenerno-Fizicheskij Inst., Moscow (Russian Federation)); Shchedrin, I.S. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Calculations of the electric field maximum intensity on the surface of a ring corrugated waveguide to the main field harmonic on the waveguide axis ratios for different types of oscillations have been conducted. The obtained data are supposed to be used in the construction of compact accelerating structures. 3 refs., 2 figs.

24219 (JINR-D–9-92-455, pp. 249-251) **Combined accelerating structure with optimized multi resonator buncher.** Vakhrushin, Yu.P. (Nauchno-Issledovatel'skij Inst Ehlektrofizicheskoj apparatury im. D.V.Efremova, Sankt-Peterburg (Russian Federation)); Ryabtsev, A.V.; Smirnov, V.L.; Terent'ev, V.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The combined accelerating structure comprising a multi resonator beam buncher where more than of 70% of injected particles are trapped into accelerating mode is described. The initial part (resonator substructure) of the system operates in a standing wave mode; the final part (waveguide substructure) operates in the travelling wave mode. The beam buncher is a section of resonator structure with coaxial coupling cells. Parameters of the optimized four-gap beam buncher are given. 6 refs., 1 tab., 2 figs.

24220 (JINR-D–9-92-455, pp. 252-257) **TRANSI - the program for calculation of transient processes in inhomogeneous accelerating structures.** Orlov, A.K. (Nauchno-Issledovatel'skij Inst Ehlektrofizicheskoj apparatury im. D.V.Efremova, Sankt-Peterburg (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Results of the calculation of transient processes arising in inhomogeneous accelerating structures are presented. Biperiodic electrodynamic chain which is coupling resonators with the proper frequency, the effective shunt resistance and the Q - factor comprising an accelerating gap and which are separated with a drift gap is considered. Time variation of accelerated particle spectra is shown. 5 refs., 1 fig.

24221 (JINR-D–9-92-455, pp. 269-273) **Investigation of multipactoring discharge in an H-type resonator of an ion linac.** Lobzev, L.D. (UNTs Khar'kovskogo Fiziko-Tekhnicheskogo Instituta, Kharkov (Ukraine)); Mazalov, Yu.P.; Gusev, E.V.; Shulika, N.G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The study on the variation of parameters of an auto generator power supply of an ion linear accelerator which is under construction on the base of the H-type resonator with drift tube comb mounts has been made. The main attention was paid to investigating multipactor discharges. It is concluded, that presence of secondary autonomous self-oscillation circuit providing the field rise with the frequency close to operation frequency leads to the decrease of multipactor discharge intensity level, which is enough for the elimination of their harmful effect on accelerator steady-state performance. 8 refs., 3 figs.

24222 (JINR-D–9-92-455, pp. 280-281) **Excitation of coaxial sections of a waveguide structure.** Golubykh, S.M. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The analytical solution of the problem of excitation of coaxial sections of an accelerator waveguide structure is obtained. 1 ref., 1 fig.

24223 (JINR-D–9-92-455, pp. 293-296) **Accelerating resonators with mechanical frequency tuning.** Vodop'yanov, F.A. (RAN, Moskovskij Radiotekhnicheskij Inst, Moscow (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The possibility of mechanical frequency tuning of the narrow frequency range accelerating resonators is investigated. Some examples are shown. Resonators with mechanical frequency tuning have higher Q-factor to compare with ferrite resonators, are chipper in manufacturing and have much long life. The designed accuracy of proper frequency variation in the chain of a large number of resonators may be attained by means of supplying them with the fast trimming tabs.

24224 (JINR-D–9-92-455, pp. 303-304) **Optimization of algorithms for calculating magnetic fields of iron-free magnetic systems.** Zhidkov, E.P. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Egikyan, R.S.; Merkulov, L.A.; Nikonov, Eh.G.; Yudin, I.P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The modified variant of a computer code designed for calculating the 'STORS' toroidal spectrometer superconducting magnet field is described. In the given method the optimal conditions are fulfilled for the 20 - 25 numbers of the curved sections, thus the counting rate increase of 8 - 9 times is obtained in the comparison with other methods. 2 refs., 1 fig.

24225 (JINR-D–9-92-455, pp. 309-313) **High-voltage pulse generator based on inductive-coupled circuits.** Sidorov, A.I. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

A new scheme of a high-voltage pulse two-stage L C-generator is suggested. The novelty in generator scheme is the possibility of simultaneous power gain with the increase of output voltage. At charging voltage of 11 kV the output voltage is 43 kV and power amplification factor is 5. 5 refs., 5 figs.

24226 (JINR-D–9-92-455, pp. 314-319) **Magnets of large-aperture spectrometer KOMBAS.** Anan'ev, S.M. (Nauchno-Issledovatel'skij Inst Ehlektrofizicheskoj Apparatury im. D.V.Efremova, Sankt-Peterburg (Russian Federation)); Kashikhin, V.S.; Lamzin, E.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The design study of the KOMBAS large-aperture spectrometer two-sectional magnetic system has been carried out. The KOMBAS spectrometer is intended for experiments with heavy ion beams accelerated at the U-400 and U-400M cyclotrons. Each section comprises two bending magnets and two correction magnets. 3 refs., 4 figs.

24227 (JINR-D–9-92-455, pp. 320-325) **Calculation of an vacuum system of an accelerator of H^- ion intense beams.** Olejnik, E.E. (AN Ukrainy, Inst Yademykh Issledovanij, Kiev (Ukraine)); Bykov, V.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Results of the calculation of the TsPR-144 isochronous cyclotron vacuum system are presented. The cyclotron is designed for the acceleration of H^- intense beams vacuum parameters of the chamber are given. The main requirements for producing the vacuum chamber are determined. The design losses at the radius of 0.6 m is $\approx$ 5%. 5 refs., 2 tabs., 2 figs.

24228 (JINR-D–9-92-455, pp. 326-329) **Inductive energy storage based high-voltage power supply system of an electron linac.** Muratov, A.V. (Nauchno-Issledovatel'skij Inst Ehlektrofizicheskoj Apparatury im. D.V.Efremova, Sankt-Peterburg (Russian Federation)); Solov'ev, Yu.V.; Ehrmel', V.Eh. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The scheme of an inductive energy storage based on a thyristor and designed for charging electron linac shaping line is developed. The energy storage allows to improve overall dimensions of electron linac power supplies at the expanse of expelling large-size power transformers. It is shown that one may that one may construct the equipment with average power of up to 40 kw on the base of one thyristor switch. 1 ref., 3 figs.

24229 (JINR-D–9-92-455, pp. 330-333) **Analysis of field harmonics of rectangular aperture magnets.** Dojnikov, N.I. (Nauchno-Issledovatel'skij Inst Ehlektrofizicheskoj Apparatury im. D.V.Efremova, Sankt-Peterburg (Russian Federation)); Sychevskij, S.E.; Chirkov, A.E. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Rectangular aperture magnet field harmonics analysis has been carried out with the FOURIE computer code with the aim of the verification of the obtained results their faith fullness to some particular cases of dipole, quadrupole and sextupole fields is established. 4 refs., 2 figs.

24230 (JINR-D–9-92-455, pp. 334-338) **Charge exchange injection system kicker magnets pulse power supply.** Goncharenko, V.P. (Nauchno-Issledovatel'skij Inst Ehlektrofizicheskoj Apparatury im. D.V.Efremova, Sankt-Peterburg (Russian Federation)); Lebedev, A.P.; Fedorov, V.D. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The scheme of a power supply system of a charge-exchange injection system kicker magnets is described. Current pulse rise formation is performed at resonance discharge of a reservoir capacitor; flat-top current stability is provided by means of a compensation source having high capacitance which $\geq$ 1.2 F of an output capacitor; the formation of pulse trailing edge is provided with the introduction of artificial series-inductive switching of the principal thyristor. Power supply design is the 'Vishnya' type two frames having overall dimensions of 600 x 700 x 200 mm each. 3 figs.

24231 (JINR-D–9-92-455, pp. 339-341) **Compression chain with prepulse compensation.** Sidorov, A.I. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The scheme of a pulse power amplification chain with the prepulse compensation is described. The prepulse compensation device can be applied both in conventional compression chains and in compression chains with a transformer. 3 refs., 3 figs.

24232 (JINR-D–9-92-455, pp. 345-347) **Direct current stabilizers for supplying magnet coils of iron-core current channel of the JINR phasotron.** Denisov, Yu.N. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Kazakova, G.G.; Kalinichenko, V.V.; Solomnikov, V.P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Direct current stabilizers designed for the JINR phasotron iron-current channel power supply are described. Stabilizers provide current instability and pulsations being $\approx 10^{-3}$ in the range of current variation of 7.5 - 12.2 kA and 3.0 - 3.2 kA correspondingly. The stabilizer scheme comprises a constant voltage auto modulation comparator. 10 refs., 3 figs.

24233 (JINR-D–9-92-455, pp. 348-351) **Magnetic system of the U-115T isochronous cyclotron.** Alenitskij, Yu.G. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Zaplatin, N.L.; Samsonov, E.V.; Chesnov, A.F.; Chesnova, S.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The four-spiral magnetic system of the U-115T isochronous cyclotron designed for the isotope production during irradiating internal targets with 200 MeV, 200 μA accelerated proton beam is described. Magnetic field in the central region is formed by means of an annular shim having internal and external radii of 7.2 and 11 mm correspondingly. Magnetic system parameters are given. 5 refs., 2 tabs., 5 figs.

24234 (JINR-D–9-92-455, pp. 352-360) **Application of ceramics, dielectric coatings and insulation materials in magnetic circuits structures of magnet coils.** Antipov, V.F. (Nauchno-Issledovatel'skij Inst Ehlektrofizicheskoj Apparatury im. D.V.Efremova, Sankt-Peterburg (Russian Federation)); Nesterenko, V.M.; Severgin, Yu.P.; Filimonov, M.Z. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Nitride group ceramics materials are analyzed and suggested as the intra coil insulation for electromagnetic coils based on silicon nitride and aluminium oxide. Metallic solders for copper bus structural elements connection are chosen. The electrical strength tests of functional samples of coils with selected insulation materials have been made. 1 tab. 1 fig.

24235 (LA-UR–95-1385) **Subpicosecond, ultra-bright electron injector.** Carlsten, B.E. (and others); Milder, M.L.; Kinross-Wright, J. Los Alamos National Lab., NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950512–237: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95014012. Source: OSTI; NTIS; GPO Dep.

We have designed and are building a subpicosecond electron injector. The injector is based on a 7.5 MeV photoinjector, used previously at Los Alamos in the APEX experiment. The nominal design includes magnetically compressing a 20 ps long, 3 nC bunch to a FWHM bunch length of 2/3 ps (peak current in excess of 3 kA) using a four dipole chicane buncher. The geometrial averaged transverse normalized transverse emittance after compression is about 15 ir mm mrad.

24236 (LA-UR–95-1386) **Phase-stable, microwave FEL amplifier.** Carlsten, B.E. (Los Alamos National Lab., NM (United States)); Fazio, M.V.; Haynes, W.B.; May, L.; Potter, M. Los Alamos National Lab., NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950512–238: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95014011. Source: OSTI; NTIS; GPO Dep.

Free-electron laser (FEL) amplifiers have demonstrated high efficiency and high output power for microwave wavelengths. However, using present technology, microwave FEL amplifiers are not phase stable enough to be suitable for driving linear accelerators, where several much amplifiers need to be phase locked. The growing wave's phase sensitivity to the beam voltage in the small-signal gain regime is responsible for the largest contribution to this phase instability. We discuss a scheme that reduces the phase sensitivity to the beam voltage by operating off synchronism and matching the phase variation resulting from the desynchronism to the phase variation from the reduced plasma wavenumber as the beam voltage changes.

24237 (LBL–36459) **Engineering conceptual design of the relativistic Klystron two-beam accelerator based power source for 1-TeV next linear collider.** Reginato, L.; Deadrick, F.; Peters, C.; Vanecek, D.; Yu, S. Lawrence Berkeley Lab., CA (United States). Apr 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-950512–260: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95014870. Source: OSTI; NTIS; INIS; GPO Dep.

Ultra-high gradient radio frequency linacs require efficient and reliable power sources. The induction linac has proven to be a reliable source of low energy, high current and high brightness electron beams. The low energy beam is bunched, transported through resonant transfer cavities in which it radiates microwave energy that is coupled to an adjacent high energy accelerator. The low energy beam is maintained at a constant energy by periodic induction accelerator cells. This paper describes the engineering aspects of the induction accelerator based relativistic klystron. The physics issues are covered in another paper at this conference.

24238 (LBL-PUB–754, pp. 19-28) **BIG KARL and COSY: Examples for high performance magnet design taught by "Papa Klaus".** Bechtstedt, U. (Institut fuer Kernphysik, Juelich (Germany)); Hacker, U.; Maier, R.; Martin, S.; Berg, G.P.A.; Hardt, A.; Huerlimann, W.; Meissburger, J.; Roemer, J.G.M. Lawrence Berkeley Lab., CA (United States). Feb 1995. In *The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.* 202p. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

The past decades have seen a tremendous development in nuclear, middle, and high energy physics. This advance was in a great part promoted by the availability of newer and more powerful instruments. Over time, these instruments grew in size as well as in sophistication and precision. Nearly all these devices had one fundamental thing in common - magnetic fields produced with currents and iron. The precision demanded by the new experiments and machines did bring the magnet technology to new frontiers requiring the utmost in the accuracy of magnetic fields. The complex properties of the iron challenged innumerable physicists in the attempt to force the magnetic fields into the desired shape. Experience and analytical insight were the pillars for coping with those problems and only few mastered the skills and were in addition able to communicate their intricate knowledge. It was a fortuitous situation that the authors got to know Klaus Halbach who belonged to those few and who shared his knowledge contributing thus largely to the successful completion of two large instruments that were built at the Forschungszentrum Juelich, KFA, for nuclear and middle energy physics. In one case the efforts went to the large spectrometer named BIG KARL whose design phase started in the early 70's. In the second case the work started in the early 80's with the task to build a high precision 2.5 GeV proton accelerator for cooled stored and extracted beams known as COSY-Juelich.

24239 (LBL-PUB–754, pp. 29-37) **Calculated and measured fields in superferric wiggler magnets.** Blum, E.B. (Brookhaven National Lab., Upton, NY (United States)); Solomon, L. Lawrence Berkeley Lab., CA (United States). Feb 1995. DOE Contract AC02-76CH00016. In *The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.* 202p. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

Although Klaus Halbach is widely known and appreciated as the originator of the computer program POISSON for electromagnetic field calculation, Klaus has always believed that analytical methods can give much more insight into the performance of a magnet than numerical simulation. Analytical approximations readily show how the different aspects of a magnet's design such as pole dimensions, current, and coil configuration contribute to the performance. These methods yield accuracies of better than 10%. Analytical methods should therefore be used when conceptualizing a magnet design. Computer analysis can then be used for refinement. A simple model is presented for the peak on-axis field of an electromagnetic wiggler with iron poles and superconducting coils. The model is applied to the radiator section of the superconducting wiggler for the BNL Harmonic Generation Free Electron Laser. The predictions of the model are compared to the measured field and the results from POISSON.

24240 (LBL-PUB–754, pp. 39-44) **Comparison of conventional and novel quadrupole drift tube magnets inspired by Klaus Halbach.** Feinberg, B. (Lawrence Berkeley Lab., CA (United States)). Lawrence Berkeley Lab., CA (United States). Feb 1995. In *The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.* 202p. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

Quadrupole drift tube magnets for a heavy-ion linac provide a demanding application of magnet technology. A comparison is made of three different solutions to the problem of providing an adjustable high-field-strength quadrupole magnet in a small volume. A conventional tape-wound electromagnet quadrupole magnet (conventional) is compared with an adjustable permanent-magnet/iron quadrupole magnet (hybrid) and a laced permanent-magnet/iron/electromagnet (laced). Data is presented from magnets constructed for the SuperHILAC heavy-ion linear accelerator, and conclusions are drawn for various applications.

24241 (LBL-PUB–754, pp. 45-50) **Concept of quasi-periodic undulator - control of radiation spectrum.** Sasaki, Shigemi (Japan Atomic Energy Research Institute, Ibaraki (Japan)). Lawrence Berkeley Lab., CA (United States). Feb 1995. In *The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.* 202p. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

A new type of undulator, the quasi-periodic undulator (QPU) is considered which generates the irrational harmonics in the radiation spectrum. This undulator consists of the arrays of magnet blocks aligned in a quasi-periodic order, and consequentially lead to a quasi-periodic motion of electron. A combination of the QPU and a conventional crystal/grating monochromator provides pure

monochromatic photon beam for synchrotron radiation users because the irrational harmonics do not be diffracted in the same direction by a monochromator. The radiation power and width of each radiation peak emitted from this undulator are expected to be comparable with those of the conventional periodic undulator.

24242 (LBL-PUB–754, pp. 55-63) **Field errors in hybrid insertion devices.** Schlueter, R.D. (Lawrence Berkeley Lab., CA (United States)). Lawrence Berkeley Lab., CA (United States). Feb 1995. DOE Contract AC03-76SF00098. In *The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.* 202p. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

Hybrid magnet theory as applied to the error analyses used in the design of Advanced Light Source (ALS) insertion devices is reviewed. Sources of field errors in hybrid insertion devices are discussed.

24243 (LBL-PUB–754, pp. 65-73) **Field of a helical Siberian Snake.** Luccio, A. (Brookhaven National Lab., Upton, NY (United States)). Lawrence Berkeley Lab., CA (United States). Feb 1995. In *The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.* 202p. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

To preserve the spin polarization of a beam of high energy protons in a circular accelerator, magnets with periodic magnetic field, called Siberian Snakes are being used. Recently, it was proposed to build Siberian Snakes with superconducting helical dipoles. In a helical, or twisted dipole, the magnetic field is perpendicular to the axis of the helix and rotates around it as one proceeds along the magnet. In an engineering study of a 4 Tesla helical snake, the coil geometry is derived, by twisting, from the geometry of a cosine superconducting dipole. While waiting for magnetic measurement data on such a prototype, an analytical expression for the field of the helice is important, to calculate the particle trajectories and the spin precession in the helix. This model will also allow to determine the optical characteristics of the snake, as an insertion in the lattice of the accelerator. In particular, one can calculate the integrated multipoles through the magnet and the equivalent transfer matrix. An expression for the field in the helix body, i.e., excluding the fringe field was given in a classical paper. An alternate expression can be found by elaborating on the treatment of the field of a transverse wiggler obtained under the rather general conditions that the variables are separable. This expression exactly satisfies Maxwell's div and curl equations for a stationary field, $\nabla \cdot B = 0$, $\nabla \times B = 0$. This approach is useful in that it will allow one to use much of the work already done on the problem of inserting wigglers and undulators in the lattice of a circular accelerator.

24244 (LBL-PUB–754, pp. 121-133) **Insertion device calculations with mathematica.** Carr, R. (Stanford Synchrotron Radiation Lab., CA (United States)); Lidia, S. Lawrence Berkeley Lab., CA (United States). Feb 1995. In *The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.* 202p. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

The design of accelerator insertion devices such as wigglers and undulators has usually been aided by numerical modeling on digital computers, using code in high level languages like Fortran. In the present era, there are higher level programming environments like IDL®, MatLab®, and Mathematica® in which these calculations may be performed by writing much less code, and in which standard mathematical techniques are very easily used. The authors present a suite of standard insertion device modeling routines in Mathematica to illustrate the new techniques. These routines include a simple way to generate magnetic fields using blocks of CSEM materials, trajectory solutions from the Lorentz force equations for given magnetic fields, Bessel function calculations of radiation for wigglers and undulators and general radiation calculations for undulators.

24245 (LBL-PUB–754, pp. 137-141) **Low-field permanent magnet quadrupoles in a new relativistic-klystron two-beam accelerator design.** Yu, S. (Lawrence Berkeley Lab., CA (United States)); Sessler, A. Lawrence Berkeley Lab., CA (United States). Feb 1995. In *The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.* 202p. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

Permanent magnets play a central role in the new relativistic klystron two-beam-accelerator design. The two key goals of this new design, low cost and the suppression of beam break-up instability are both intimately tied to the permanent magnet quadrupole focusing system. A recently completed systems study by a joint LBL-LLNL team concludes that a power source for a 1 TeV center-of-mass Next Linear Collider based on the new TBA design can be as low as $1 billion, and the efficiency (wall plug to rf) is estimated to be 36%. End-to-end simulations of longitudinal and transverse beam dynamics show that the drive beam is stable over the entire TBA unit.

24246 (LBL-PUB–754, pp. 161-173) **Operation of a small-gap undulator on the NSLS X-ray Ring.** Stefan, P.M. (Brookhaven National Lab., Upton, NY (United States)); Krinsky, S.; Rakowsky, G.; Solomon, L. Lawrence Berkeley Lab., CA (United States). Feb 1995. In *The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.* 202p. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

The authors report results of an on-going experiment being carried out in the X13 straight section of the NSLS X-ray Ring which explores the limits of the operation of small-gap undulators. In particular, they discuss the operation of a 16 mm period small-gap undulator. At an electron beam current of 300 mA the variable gap vacuum chamber has been closed to an inner aperture of 3.8 mm with no effect on the electron beam lifetime. Measurements of the output radiation spectrum at a magnet gap of 7.5 mm are described.

24247 (LBL-PUB–754, pp. 253-256) **The first insertion devices at SSRL - some personal recollections.** Winick, H. (Stanford Linear Accelerator Center, CA (United States)). Lawrence Berkeley Lab., CA (United States). Feb 1995. In *The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.* 202p. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

The author recounts his experiences with insertion devices at the Stanford Synchrotron Radiation Laboratory. His first experiences with wigglers occured at the Cambridge Electron Accelerator, and was carried over to SSRL with the proposal for a six pole electromagnetic wiggler. Most modern undulators, and many wigglers are now designed around permanent magnets, and the origin of this transition at SSRL was rather fortuitous and humorous. It reflects some of the personality characteristics of Klaus Halbach.

24248 (LBL-PUB–754, pp. 265-273) **Transition undulator radiation as bright infrared sources.** Kim, K.J. (Lawrence Berkeley Lab., CA (United States)). Lawrence Berkeley Lab., CA (United States). Feb 1995. In *The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.* 202p. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

Undulator radiation contains, in addition to the usual component with narrow spectral features, a broad-band component in the low frequency region emitted in the near forward direction, peaked at an angle $1/\gamma$, where γ is the relativistic factor. This component is referred to as the transition undulator radiation, as it is caused by the sudden change in the electron's longitudinal velocity as it enters and leaves the undulator. The characteristic of the transition undulator radiation are analyzed and compared with the infrared radiation from the usual undulator harmonics and from bending magnets.

24249 (LBL-PUB–754, pp. 275-285) **Use of the Halbach perturbation theory for the multipole design of the ALS storage ring sextupole.** Marks, S. (Lawrence Berkeley Lab., CA (United States)). Lawrence Berkeley Lab., CA (United States). Feb 1995. In *The art and science of magnet design: A Festschrift in honor of Klaus Halbach. Volume 1.* 202p. Order Number DE95008449. Source: OSTI; NTIS; INIS; GPO Dep.

The Advanced Light Source (ALS) storage ring sextupole is a unique multi-purpose magnet. It is designed to operate in the primary or sextupole mode and in three auxiliary trim modes: horizontal steering, vertical steering, and skew quadrupole. Klaus

Halbach developed a perturbation theory for iron-dominated magnets which provides the basis for this design. Many magnet designers, certainly those who have been exposed to Klaus, are familiar with this theory and have used it for such things as evaluating the effect of assembly alignment errors. The ALS sextupole design process was somewhat novel in its use of the perturbation theory to design essential features of the magnet. In particular, the steering and skew quadrupole functions are produced by violating sextupole symmetry and are thus perturbations of the normal sextupole excitation. The magnet was designed such that all four modes are decoupled and can be excited independently. This paper discusses the use of Halbach's perturbation theory to design the trim functions and to evaluate the primary asymmetry in the sextupole mode, namely, a gap in the return yoke to accommodate the vacuum chamber. Prototype testing verified all operating modes of the magnet and confirmed the expected performance from calculations based upon the Halbach perturbation theory. A total of 48 sextupole magnets of this design are now installed and operating successfully in the ALS storage ring.

24250 (LS–160) **APS storage ring vacuum chamber tests for dimensional stability after bakeout cycling while under vacuum.** Wehrle, R.; Nielsen, R. Argonne National Lab., IL (United States). Sep 1990. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015500. Source: OSTI; NTIS; GPO Dep.

Vacuum chamber sections No. 1 and No. 2 were used for these tests. Section No. 1, a short straight section, is representative in these tests of Sections No. 3 and No. 5 as well. Section No. 2 is the longer curved section used within the dipole bend magnets and is representative of the similar Section No. 4. The combination of Sections No. 1 and No. 2 joined by a connected bellows was mounted as presently planned for the final installation. This afforded an early testing of chamber positional stability after bakeout cycling. Tests of chamber dimensional stability were also made during vacuum cycling.

24251 (LS–166) **A radial coil probe for quadrupole magnet measurements.** Kim, S.H. Argonne National Lab., IL (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015217. Source: OSTI; NTIS; INIS; GPO Dep.

This note describes a rotating coil probe of "radial-winding geometry" for the measurements of the magnetic center, quadrupole fields and multipole coefficients of quadrupole magnets. The active length of the coil is longer than the magnet length, so that all the measurements will be integrated values along the longitudinal direction of the magnets. Errors of the measurements due to the fabrication tolerances of the coil are discussed.

24252 (LS–167) **Tagential winding coil probes for dipole, quadrupole and sextupole magnet measurements.** Kim, S.H. Argonne National Lab., IL (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015231. Source: OSTI; NTIS; INIS; GPO Dep.

The number of coils for a rotating coil probe of "tangential winding geometry depends on the requirements of the magnet measurements. In order to measure the main field, multipole coefficients and the location of the magnetic center axis, two sets of coils are sufficient for a rotating coil probe of "radial winding geometry." A probe of tangential winding geometry, on the other hand, requires more than two sets of coils to measure the above field parameters. This note describes probes of tangential winding geometry with a minimum number of coils for dipole, quadrupole and sextupole magnet measurements.

24253 (LS–168) **Design of kicker magnet and power supply unit for synchrotron beam injection.** Wang, Ju. Argonne National Lab., IL (United States). Mar 1991. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015230. Source: OSTI; NTIS; INIS; GPO Dep.

To inject beams from the positron accumulator ring (PAR) into the synchrotron, a pulsed kicker magnet is used. The specifications of this kicker magnet and the power supply unit are listed and discussed in this report.

24254 (LS–171) **Magnet measurement interfacing to the G-64 Euro standard bus and testing G-64 modules.** Hogrefe, R.L. Argonne National Lab., IL (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95015227. Source: OSTI; NTIS; INIS; GPO Dep.

The Magnet Measurement system utilizes various modules with a G-64 Euro (Gespac) Standard Interface. All modules are designed to be software controlled, normally under the constraints of the OS-9 operating system with all data transfers to a host computer accomplished by a serial link.

24255 (LS–172) **Cleaning of aluminum after machining with coolants.** Roop, B. Argonne National Lab., IL (United States). [1995]. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015226. Source: OSTI; NTIS; INIS; GPO Dep.

An x-ray photoemission spectroscopic study was undertaken to compare the cleaning of the Advanced Photon Source (APS) aluminum extrusion storage ring vacuum chambers after machining with and without water soluble coolants. While there was significant contamination left by the coolants, the cleaning process was capable of removing the residue. The variation of the surface and near surface composition of samples machined either dry or with coolants was negligible after cleaning. The use of such coolants in the machining process is therefore recommended.

24256 (LS–173(ANL)) **Radial and tangential winding coil probes for sextupole magnet measurements.** Kim, S.H. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015545. Source: OSTI; NTIS; INIS; GPO Dep.

Rotating coil probes of radial and tangential winding geometries for the measurements of the magnetic center, main field integral and multipole coefficients of sextupole magnets are describes. Two sets of coils are sufficient for a probe of radial winding geometry. For a tangential winding probe, however, typically several sets of coils are required to measure the above magnetic parameters. The tangential coil geometry in this note is described with three sets of coils. The main sextupole field coefficients are defined as b_2 = $1.0cm^{-2}$ and $a_2 = 0$ for the expression of the multipole field coefficients.

24257 (LS–181) **Power supplies for the injector synchrotron quadrupoles and sextupoles.** Fathizadeh, M. Argonne National Lab., IL (United States). [1995]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015207. Source: OSTI; NTIS; INIS; GPO Dep.

This light source note will describe the power supplies for the injector synchrotron quadrupole and sextupole magnets. The injector synchrotron has two families of quadrupole magnets. Each family consists of 40 quadrupole magnets connected in series. These magnets are energized by two phase-controlled, 12-pulse power supplies. Therefore, each power supply will be rated to deliver the necessary power to only 40 quadrupole magnets. The two families of sextupole magnets in the injector synchrotron each consists of 32 sextupole magnets connected in series, powered by a phase-controlled power supply. Thus, each power supply shall be capable of delivering power to only 32 sextupole magnets.

24258 (LS–185) **Power supply control units for APS ring magnets.** Despe, O.D. Argonne National Lab., IL (United States). 15 Apr 1990. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015399. Source: OSTI; NTIS; INIS; GPO Dep.

The APS storage ring (1104 meters) is divided into 40 sectors. Each sector has 38 magnet coils in five magnet bases. Every alternate sector has an additional quadrupole magnet for skew correction. AR the main dipole magnets, two in each sector are connected in series and fed from one power supply unit. A base is controlled by one power supply control unit (PSCU). Each PSCU is connected to the host computer via a local area network (LAN). This note discusses the hardware configuration of the typical power supply control system used by the APS magnets and the software commands supported by the PSCU.

24259 (LS–186) **Cavity design and beam simulations for the APS rf gun.** Borland, M. Argonne National Lab., IL (United States). 15 Nov 1991. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015400. Source: OSTI; NTIS; INIS; GPO Dep.

An earlier note discussed the preliminary design of the 1-1/2 cell RF cavity for the APS RF gun. This note describes the final design, including cavity properties and simulation results from the program rf gun. The basic idea for the new design was that the successful SSRL design could be improved upon by reducing fields that had nonlinear dependence on radius. As discussed previously, this would reduce the emittance and produce tighter momentum and time distributions. In addition, it was desirable to increase the fields in the first half-cell relative to the fields in the second half-cell, in order to allow more rapid initial acceleration, which would reduce the effects of space charge. Both of these goals were accomplished in the new design.

24260 (LS–190) **Development of General Purpose Data Acquisition Shell (GPDAS).** Chung, Y.; Kim, K. Argonne National Lab., IL (United States). [1995]. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015223. Source: OSTI; NTIS; INIS; GPO Dep.

This note is intended as an abbreviated introduction to the concept and the structure of General Purpose Data Acquisitions Shell (GPDAS) and assumes the reader has a certain level of familiarity with programming in general. The structure of the following sections consists of brief explanations of the concepts and commands of GPDAS, followed by several examples. Some of these are tabulated in the appendices at the end of this note.

24261 (LS–193) **BPM button characterization for offset calibration.** Chung, Y. Argonne National Lab., IL (United States). Mar 1992. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015222. Source: OSTI; NTIS; INIS; GPO Dep.

In this note, a basic theory of wave propagation in dielectric media is discussed in conjunction with S parameters to derive the button gain coefficient g_e and an analytic expression for the signal from time domain reflectometry (TDR) measurement on a cable and a button. The results can be used to measure the button capacitance and the characteristic impedances of the cable and the button feedthrough. Since g_e is a function of S parameters and the button capacitance C_p, a suggestion is made to make the gain coefficients the same for all four buttons in a BPM by carefully matching the buttons and the cables.

24262 (LS–197) **Preliminary cleaning tests on candidate materials for APS beamline and front end UHV components.** Nielsen, R.; Kuzay, T.M. Argonne National Lab., IL (United States). 12 May 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015221. Source: OSTI; NTIS; INIS; GPO Dep.

Comparative cleaning tests have been done on four candidate materials for use in APS beamline and front-end vacuum components. These materials are 304 SS, 304L SS, OFHC copper, and Glidcop® (Cu-Al_2O_3)- Samples of each material were prepared and cleaned using two different methods. After cleaning, the sample surfaces were analyzed using ESCA (Electron Spectography for Chemical Analysis). Uncleaned samples were used as a reference. The cleaning methods and surface analysis results are further discussed.

24263 (LS–200) **Effect of eddy current in the laminations on the magnet field.** Chung, Y.; Galayda, J. Argonne National Lab., IL (United States). Apr 1992. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95015564. Source: OSTI; NTIS; INIS; GPO Dep.

In this note theory and measurements of the effect of the eddy current in the laminations on the magnet field are presented. The theory assumes a simple solenoid-type magnet with laminated iron core and ignores the end field effect. The measurements were made on the input voltage and current, and the dipole component of the magnetic field in the middle of the magnet bore. The amplitude and phase relations between these quantities give the field attenuation factor, phase delay, and resistance and inductance of the magnet as functions of frequency. Comparisons of results with theory are discussed.

24264 (LS–203) **Fundamental mode frequency of the storage ring single cell cavity.** Kang, Y.W. Argonne National Lab., IL (United States). 27 May 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015206. Source: OSTI; NTIS; INIS; GPO Dep.

The fundamental mode frequency of the prototype storage ring cavity has been measured with various port terminations and cavity temperatures. Since the highest tuned frequency of the prototype cavity with a tuner under the high RF power test condition is measured to be lower than the system specified frequency, a slight dimensional change in the cavity design is required for manufacturing future cavities. In addition to this, an extra dimensional correction is required to compensate the volume changes due to the tuner position and increased port sizes. In the following, the measured frequencies and the estimated frequency shift due to the volume changes are discussed. The correction to the internal dimension of the new cavity design based on the estimated frequency shift is also discussed.

24265 (LS–204) **Thermo-mechanical optimization of Fixed Mask 2 for APS front ends.** Nian, H.L.T.; Kuzay, T.M.; Sheng, I.C.A. Argonne National Lab., IL (United States). 27 Jul 1992. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015205. Source: OSTI; NTIS; INIS; GPO Dep.

Fixed mask 2 (FM2) is one of the critical elements on the front end of the beamlines at the Advanced Photon Source (APS) now under construction at Argonne National Laboratory (ANL). The FM2 uses an enhanced heat transfer tube developed at ANL. Due to large thermal loads on these components, inclined geometry is used in the design to spread the footprint of the x-ray beam. Even then, thermal loads are very critical. To address the thermal and thermo-mechanical issues, analytical studies have been applied to a simplified model of the FM2 tube. The maximum temperature and maximum effective stress have been parametrically studied. Results for maximum temperatures and stresses are obtained and compared with the available strength/fatigue data for the materials proposed for the fixed mask design.

24266 (LS–205) **Thermo-mechanical optimization of photon shutter 1 for APS front ends.** Nian, H.L.T.; Kuzay, T.M.; Sheng, I.C.A. Argonne National Lab., IL (United States). 28 Jul 1992. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015390. Source: OSTI; NTIS; INIS; GPO Dep.

Photon shutter 1 (PS1) is one of the most critical elements on the front end of the beamlines at the Advanced Photon Source (APS) now under construction at Argonne National Laboratory (ANL). The PS1 uses an enhanced heat transfer tube developed at ANL. Due to large thermal loads on these components, inclined geometry is used in the design to spread the footprint of the x-ray beam. Even then, thermal loads are very critical. To address the thermal and thermo-mechanical issues, analytical studies have been applied to a simplified model of the shutter tube. The maximum temperature and maximum effective stress have been parametrically studied. Results for maximum temperatures and stresses are obtained and compared with the available strength/fatigue data for the materials proposed for the shutter design.

24267 (LS–207) **Interpolation of Hall probe calibration data.** Carnegie, D.W. Argonne National Lab., IL (United States). 23 Jul 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015389. Source: OSTI; NTIS; INIS; GPO Dep.

Calibrated Hall-effect magnetic-field sensors will be used to map the magnetic field in insertion devices. Typical calibration data give the magnetic field as a function of measured signal and temperature on a two-dimensional grid. We need to calculate the magnetic field from the two measured signals. As an example, this work uses the calibration data supplied with a Hall-effect measurement system from Group 3 Technology Ltd. Detailed field-versus-signal data are given for three calibration temperatures for each of four

gain settings. Two methods for performing the interpolation are presented for a fixed gain setting. The first method fits the three field-versus-signal data sets to three polynomials minimizing the sum of squares of the errors and then interpolates for the temperature. The second method uses a bivariate interpolation routine. In this method, there are no residual errors at the calibration points. The two methods are compared. The selection of the method used will depend on what errors are present in the calibration data.

24268 (LS–208) **Thermo-mechanical parametric studies of Fixed Mask 1 and Photon Shutter 2 for APS front ends.** Nian, H.L.T.; Kuzay, T.M.; Sheng, I.C.A. Argonne National Lab., IL (United States). 3 Sep 1992. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015388. Source: OSTI; NTIS; INIS; GPO Dep.

Fixed Mask 1 (FM1) and Photon Shutter 2 (PS2) are two of the critical elements on the front end of the beamlines at the Advanced Photon Source (APS) now under construction at Argonne National Laboratory (ANL). FMI and PS2 use an enhanced heat transfer tube developed at ANL. Due to a high localized thermal gradient on these components, inclined geometry is used in their design to spread the footprint of the x-ray beam. Complete closed form solutions for steady state conditions have been developed for the analyses of the thermal and thermo-mechanical behavior of FMI and PS2. A modified Manson-Coffin fatigue relation is proposed to predict the predict the thermal fatigue. The maximum temperatures and maximum effective stresses have been parametrically studied. Fatigue-failure life predictions are presented for the FM1 and PS2 designs.

24269 (LS–209) **Effect of vacuum chamber eddy current and compensation by digital feedback.** Chung, Y. Argonne National Lab., IL (United States). 27 Jul 1992. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015387. Source: OSTI; NTIS; INIS; GPO Dep.

Measurement of the effect of the eddy current induced in the APS storage ring vacuum chamber by the storage ring sextupole magnet and its compensation using digital feedback with proportional, integral, and derivative (PID) control algorithm are presented. The magnetic field in the vacuum chamber shows strong quadrupole and sextupole components varying with frequency, in addition to significant attenuation and phase shift. Large changes in the magnet resistance and inductance were also observed. Development of a theory of digital feedback to obtain system responses and the conditions for optimal control will be described, in conduction with design of a digital filter to compensate for the eddy current effect.

24270 (LS–215) **Diamond monochromator for high heat flux synchrotron x-ray beams.** Khounsary, A.M.; Smither, R.K.; Davey, S.; Purohit, A. Argonne National Lab., IL (United States). 28 Jan 1993. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015392. Source: OSTI; NTIS; INIS; GPO Dep.

Single crystal silicon has been the material of choice for x-ray monochromators for the past several decades. However, the need for suitable monochromators to handle the high heat load of the next generation synchrotron x-ray beams on the one hand and the rapid and on-going advances in synthetic diamond technology on the other make a compelling case for the consideration of a diamond monochromator system. In this paper, we consider various aspects, advantages and disadvantages, and promises and pitfalls of such a system and evaluate the comparative performance of a diamond monochromator subjected to the high heat load of the most powerful x-ray beam that will become available in the next few years. The results of experiments performed to evaluate the diffraction properties of a currently available synthetic single crystal diamond are also presented. Fabrication of a diamond-based monochromator is within present technical means.

24271 (LS–216) **Feasibility of using a high power CO_2 laser as an alternative source to test high heat load x-ray optics.** Fernandez, P.B. Argonne National Lab., IL (United States). 10 May 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015391. Source: OSTI; NTIS; INIS; GPO Dep.

To determine the feasibility of using the CO_2 laser at LAL as an alternative heat source for x-ray optics tests, we have studied the absorption of the 10.6-micron laser light in silicon for two different dopant concentrations, using the resistivity as a predictor for the absorption length. We describe the results from these tests in this report.

24272 (LS–225) **RF characteristics of the APS storage ring isolation valve.** Song, J.J. Argonne National Lab., IL (United States). 31 Mar 1993. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015233. Source: OSTI; NTIS; INIS; GPO Dep.

The RF impedance of the sector isolation valve of the APS storage ring system was measured by the wire method with a synthetic pulse technique. The coupling impedance as well as the energy loss of the isolation valve with and without an RF liner or screen, and the flange gap of the various sizes was calculated from the measurements. There appear to be resonances at certain frequencies in the absence of an RF liner that might cause an unacceptably large coupling impedance. Data with various sizes of the flange gap show that a good RF contact around any flange is necessary. The results also are compared with computer simulation from MAFIA. The measured impedance due to the RF liner alone is within 0.2% of the total APS impedance budget.

24273 (LS–232) **Tests on conducted electrical noise on a storage ring dc-dc converter cabinet.** Carwardine, J.J. Argonne National Lab., IL (United States). 22 Feb 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015234. Source: OSTI; NTIS; INIS; GPO Dep.

Electrical noise is produced by switching transients in the power supply converters which excite resonances formed by stray capacitance and cable inductance. This noise is present not only on the load cables, but also on ground cables of the magnet and of the converter cabinet. Since there will eventually be a large number of cabinets running at one time, tests were carried out to characterize the noise and to investigate possible techniques for reducing the levels. The tests were carried out on the test girder and converter cabinet set up in 412 area. There were four magnets installed on the girder – two 0.5m quadrupoles, a 0.8m quadrupole, and a sextupole. These tests were carried out on one of the 0.5m quadrupoles. It should be noted that with this setup, the raw dc power was supplied at around 70V. In the final configuration, a 0.5m quad will be fed from a 40V raw supply. Consequently, the switching transients observed during the tests are likely to be higher than will occur in reality. Noise currents contain two main components: a low frequency component at around 50kHz, and a higher frequency component at around IMHz. It is the latter component which is of primary concern. Currents measured on the dc load cables typically were around one ampere, while currents into the building ground system were only a few tens of milliamps. Several methods were used to try reducing the noise currents, but only the addition of a series impedance was successful – other methods either had no effect or increased the ground currents.

24274 (LS–233) **Electromagnetic field analysis of septum magnet for APS positron accumulator ring.** Yokoi, Toshiaki; Turner, L.R. Argonne National Lab., IL (United States). [1995]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015232. Source: OSTI; NTIS; INIS; GPO Dep.

This report consists of three parts. The first part describes a numerical analysis method for the electromagnetic field analysis of a septum magnet. A novel improvement to the treatment of exciting currents in the time-domain is proposed. The second part discusses numerical predictions of the electromagnetic characteristics of the APS PAR septum. The time variations of stray field and eddy currents are shown for three magnet designs. The last part explores how decreasing the septum material conductivity affects the stray field. The decrease of conductivity may be caused by an inadequate manufacturing of the septum material. The significance of a high quality septum, or flat interface between copper and iron, is emphasized from a point of view of stray field. An ideal method for joining two different metals without distortion, called HIP (Hot

Isostatic Pressing), is introduced and recommended based on the authors' experience.

24275 (LS–235) **SRI CAT Section 1 bending magnet beamline description.** Srajer, G.; Rodricks, B.; Assoufid, L.; Mills, D.M. Argonne National Lab., IL (United States). 10 Mar 1994. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015213. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses: APS bending magnet source; beamline layout; beamline optical components; beamline operation; time-resolved studies station; polarization studies station; and commissioning and operational schedule.

24276 (LS–238) **High-heat-load studies of silicon and diamond monochromators using the APS/CHESS prototype undulator.** Mills, D.M.; Lee, W.K.; Smither, R.K.; Fernandez, P.B. Argonne National Lab., IL (United States). 16 Sep 1994. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015212. Source: OSTI; NTIS; INIS; GPO Dep.

The results of the latest high-heat-load studies made on the APS/CHESS prototype undulator are summarized. Four different crystals were tested: two slotted, symmetrically cut silicon crystals and a core-drilled, asymmetrically cut silicon crystal and a diamond crystal that was jet cooled using water. The purpose of the silicon crystal tests was to reevaluate the surface power loading at which appreciable degradation of the diffraction efficiency was observed. The diamond tests, allotted only a brief period of time during the testing period, were our first attempt at using diamonds for high-heat-flux x-ray monochromators and were performed primarily to gain first-hand experience with diamond monochromators. Measurements with the silicon crystal at 5 keV reconfirmed our previous measurements of performance degradation at around 4-6 watts/mm^2 using liquid gallium with slotted coolant channels. A value of only 2 watts/mm^2 was observed to cause a degradation of the diffraction performance at 15 keV with the same crystals due to the increased sensitivity to strain because of the reduced Darwin widths. The performance of the asymmetric crystal, with its core-drilled coolant channels, was not found to be as good as that of the slotted crystals. This was probably due to poorer heat transfer properties of the core-drilled geometry in combination with the narrowing of the rocking curves because of the asymmetric cut. Fabrication issues for construction of the gallium-cooled crystals is also discussed. Although the diamonds were only successfully tested at low total power the results were very encouraging and motivated us to accelerate our program on the use of diamonds for high-heat-load monochromators.

24277 (LS–239) **The effect of incident angle on the shielding thickness for secondary bremsstrahlung.** Haeffner, D.R.; Job, P.K. Argonne National Lab., IL (United States). 8 Dec 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015214. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper, the results of simulations will be given for secondary bremsstrahlung beams that are incident upon various thicknesses of Pb at several angles.

24278 (LS–240) **Identification of root cause of vibration of a liquid-gallium-cooled silicon monochromator and recommendations for abatement.** Chen, S.S.; Zhu, S.; Wambsganss, M.W.; Jendrzejczyk, J.A.; Lee, W.K. Argonne National Lab., IL (United States). Aug 1994. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015215. Source: OSTI; NTIS; INIS; GPO Dep.

Perfect single crystals of silicon are used to monochromate the high-intensity X-ray beams in the Advanced Photon Source at Argonne National Laboratory. Depending on the crystal geometry and the insertion device, the crystal may absorb anywhere from several hundred watts to in excess of a thousand watts. To minimize the thermal distortions in the crystal, this heat must be efficiently removed. Several approaches to this problem are being developed at the APSP including the use of inclined-crystal geometries, cryogenic cooling, liquid-gallium cooling, thin crystals, and the use of diamond. Most of these approaches require coolant flow within the crystals themselves. One issue of concern is the flow-induced vibrations. Two series of tests were performed earlier for a near-prototypical gallium-cooled crystal. This LS note describes a series of tests to measure the general vibration response characteristics of a complete liquid-gallium-cooled inclined-crystal monochromator system.

24279 (LS–243) **Dose rate estimates in the first optical enclosure due to particle beam loss in the insertion device transition region during injection.** Job, P.K.; Moe, H.J. Argonne National Lab., IL (United States). 9 May 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015822. Source: OSTI; NTIS; INIS; GPO Dep.

The particle beam, during injection into the storage ring, can be partly lost in one of the transition regions between the storage-ring vacuum chamber and the insertion-device (ID) straight section. The transition region is a copper interface between a standard aluminum vacuum chamber and an insertion-device vacuum chamber. This can be a problem, at least in the first few insertion devices where the injected beam is still unstable. It may create higher photon and neutron dose rates in the first optical enclosures of the upstream ID beamlines adjacent to this region. This report presents the results of the dose rate estimates for such an event and some recommendations for mitigation.

24280 (SLAC-PUB–95-6879) **Operation and performance of the PEP-II prototype longitudinal damping system at ALS.** Teytelman, D. (and others); Claus, R.; Fox, J. Stanford Linear Accelerator Center, Menlo Park, CA (United States). May 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–134: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013281. Source: OSTI; NTIS; INIS; GPO Dep.

A modular programmable longitudinal feedback system has been developed as a component of the PEP-II R+D program. This system is based on a family of VME and VXI packaged signal processing functions which implement a general purpose digital feedback controller for accelerators with bunch spacings of 2 ns. A complete PEP-II prototype system has been configured and installed for use at the LBL Advanced Light Source. The system configuration used for tests at the ALS is described and results are presented showing the action of the feedback system. Open and closed loop results showing the detection and calculation of feedback signals from bunch motion are presented and the system is shown to damp coupled-bunch instabilities in the ALS. Use of the system for accelerator diagnostics is illustrated via measurement of grow-damp transients which quantify growth rates without feedback, damping rates with feedback, and identify unstable modes.

24281 (SLAC-PUB–95-6894) **High-intensity single bunch instability behavior in the new SLC damping ring vacuum chamber.** Bane, K. (and others); Bowers, J.; Chao, A. Stanford Linear Accelerator Center, Menlo Park, CA (United States). May 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–252: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013397. Source: OSTI; NTIS; INIS; GPO Dep.

New low-impedance vacuum chambers were installed in the SLC damping rings for the 1994 run after finding a single bunch instability with the old chamber. Although the threshold is lower with the new vacuum chamber, the instability is less severe, and we are now routinely operating at intensities of 4.5 x 10^{10} particles per bunch (ppb) compared to 3 x 10^{10} ppb in 1993. The vacuum chamber upgrade is described, and measurements of the bunch length, energy spread, and frequency and time domain signatures of the instability are presented.

24282 (SLAC-PUB–95-6906) **Loaded delay lines for future RF pulse compression systems.** Jones, R.M. (Stanford Linear Accelerator Center, Menlo Park, CA (United States)); Wilson, P.B.; Kroll, N.M. Stanford Linear Accelerator Center, Menlo Park, CA (United States). May 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515 ;

FG03-93ER40759. (CONF-950512–132: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013283. Source: OSTI; NTIS; INIS; GPO Dep.

The peak power delivered by the klystrons in the NLCRA (Next Linear Collider Test Accelerator) now under construction at SLAC is enhanced by a factor of four in a SLED-II type of R.F. pulse compression system (pulse width compression ratio of six). To achieve the desired output pulse duration of 250 ns, a delay line constructed from a 36 m length of circular waveguide is used. Future colliders, however, will require even higher peak power and larger compression factors, which favors a more efficient binary pulse compression approach. Binary pulse compression, however, requires a line whose delay time is approximately proportional to the compression factor. To reduce the length of these lines to manageable proportions, periodically loaded delay lines are being analyzed using a generalized scattering matrix approach. One issue under study is the possibility of propagating two TE_o modes, one with a high group velocity and one with a group velocity of the order 0.05c, for use in a single-line binary pulse compression system. Particular attention is paid to time domain pulse degradation and to Ohmic losses.

24283 (SLAC-PUB–95-6907) **Investigation of the beam impedance of a slowly varying waveguide.** Jones, R.M.; Heifets, S.A. Stanford Linear Accelerator Center, Menlo Park, CA (United States). May 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–131: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013284. Source: OSTI; NTIS; INIS; GPO Dep.

A perturbation method is used to obtain analytic expressions for the multipole longitudinal and universe beam impedance for an arbitrary waveguide whose radius is slowly varying and for the specific case of a symmetric small-angle taper. This method is also applicable for a particle in a wiggler undergoing periodic motion.

24284 (SLAC-PUB–95-6908) **Nanometer resolution BPM using damped slot resonator.** Hartman, S.C. (Stanford Linear Accelerator Center, Menlo Park, CA (United States)); Shintake, T.; Akasaka, N. Stanford Linear Accelerator Center, Menlo Park, CA (United States). May 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–130: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013285. Source: OSTI; NTIS; INIS; GPO Dep.

A new type of high resolution beam position monitor called the damped slot resonator rf BPM has been installed at the focal point of the FFTB. It is comprised of a cylindrical resonant cavity with a tuned choke joint at the TM_{110} resonances. The BPM has a large dynamic range from the nm to mm range with a minimum resolution of 1 nm. We report on the rf cavity cold tests performance, processing electronics design, and some experimental results obtained in obtained in the high energy electron beam line.

24285 (SSC–100-Rev.A) **Superconducting Super Collider Magnet System requirements. Revision A.** Superconducting Super Collider Lab., Dallas, TX (United States). 23 Oct 1986. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011223. Source: OSTI; NTIS; GPO Dep.

This report discusses the Superconducting Super Collider magnet system requirements when the following categories: Functions; operational performance requirements; system configuration and essential features; structural requirements; availability/reliability; instrumentation and control requirements; design life; environment; maintenance requirements; interface systems; quality assurance; safety; and applicable codes and standards.

24286 (SSCL–671) **Impedance measurements of rf joint (Bellows shield) for collider.** Walling, L.; Spayd, N. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011189. Source: OSTI; NTIS; INIS; GPO Dep.

The collider ring for the Superconducting Super Collider (SSC) requires 6000 bellows to connect magnets and allow movement due to contraction of the magnets during cooling. Bellows have unacceptably high impedances in the collider ring and must be shielded. The original impedance budget (which was based on an older design) for 6000 rf joints was estimated at Z/n = 0.12 ohm for the longitudinal and Zt = 10 Mohn/m for the transverse impedance. With the new design it was hoped to lower these numbers to Z/n = 0 .075 ohm and Zt = 2.8 Mohm/m.

24287 (SSCL-Preprint–212) **Thermal and flow considerations for the 80 K shield of the SSC magnet cryostats.** Abramovich, S. (Superconducting Super Collider Lab., Dallas, TX (United States)); Yuecel, A.; Demko, J.; Thirumaleshwar, M. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–118: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE95011193. Source: OSTI; NTIS; INIS; GPO Dep.

The nominal temperatures in the SSC cryostat range between 4.2 K in the superconducting magnet and 300 K on the cryostat outer wall. To minimize the 4 K heat load, a thermal shield cooled by liquid and vapor nitrogen flows at 84 K and one a 20 K cooled by helium flow are incorporated in the cryostat. Tubes attached to the shields serve as conduits for cryogens. The liquid nitrogen tube in the cryostat is used for cryostat refrigeration and also for liquid distribution around the SSC rings. The second nitrogen line is used to return the vapor to the helium refrigerators for further processing. The nominal GN2 flow from a 4.3-km long cryogenic string (4 sections) to the surface is 64 g/s. The total liquid nitrogen consumption of approximately 5000 g/s will be supplied at one, two or more locations on the surface. The total heat load of the 80 K shield is estimated as 3.2 W/m. About 50% is composed of infrared radiation and remaining 50% by heat conduction through supports, vacuum barriers and other thermal connections between the shield and the 300 K outer wall. The required LN2 flow rate depends on the distribution and circulation schemes. The LN2 temperature will in turn vary depending on the flow rate and on the recooling methods used. For example, with a massflow of 400 g/s of LN2 the temperature rises from 82 K to 86 K between two compact recoolers 1 km apart. This temperature is higher thin desired. The temperature can be reduced by increasing the flow rate of the liquid or by using the continuous recooling. This paper discusses some thermal problems caused by certain mechanical designs of the 80 K shielding the possible improvement by using continuous recooling. In the following, we present results of the 80 K shield temperature distribution analysis, the 20 K shield heat load augmentation resulting from the increased 80 K shield temperatures, the continuous nitrogen recooling scheme and some flow timing related analysis.

24288 (SSCL-Preprint–221) **Low power RF beam control electronics for the LEB.** Mestha, L.K.; Mangino, J.; Brouk, V.; Uher, T.; Webber, R.C. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–119: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE95011194. Source: OSTI; NTIS; INIS; GPO Dep.

Beam Control Electronics for the Low Energy Booster (LEB) should provide a fine reference phase and frequency for the High Power RF System. Corrections applied on the frequency of the rf signal will reduce dipole synchrotron oscillations due to power supply regulation errors, errors in frequency source or errors in the cavity voltage. It will allow programmed beam radial position control throughout the LEB acceleration cycle. Furthermore the rf signal provides necessary connections during, adiabatic capture of the beam as injected into the LEB by the Linac and will guarantee LEB rf phase synchronism with the Medium Energy Booster (MEB) rf at a programmed time in the LEB cycle between a unique LEB bucket and a unique MEB bucket. We show in this paper a design and possible interfaces with other subsystems of the LEB such as the beam instrumentation, High Power RF Stations, global accelerator controls and the precision timing system. The outline of various components of the beam control system is also presented followed by some test results.

24289 (SSCL-Preprint–270) **Corrector magnets: Combined structural analysis of collider 50 mm aperture ordered wound sextupoles intedrior section.** Tran, V. Superconducting Super Collider Lab., Dallas, TX (United States). Apr 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930537–122: 5. annual international industrial symposium on the Super Collider and exhibition, San Francisco, CA (United States), 6-8 May 1993). Order Number DE95011196. Source: OSTI; NTIS; INIS; GPO Dep.

The 50mm aperture prototype collider ordered wound sextupole corrector magnets have been modeled with finite element techniques considering the individual and combined load cases of the preloading from keys, cooldown to 4 K and the effect of magnetic forces during energizing. Results of the analysis are presented as longitudinal, transverse and shear stresses for the ordered wound coils and as maximum von Mises stress for the carbon steel outer laminations, the stainless steel linear lamination, the carbon steel floating pole tips and the carbon steel keys.

24290 (SSCL-Preprint–430) **A high reliability oxygen deficiency monitoring system.** Parry, R.; Claborn, G.; Haas, A.; Landis, R.; Page, W.; Smith, J. Superconducting Super Collider Lab., Dallas, TX (United States). May 1993. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930511–525: PAC '93: international particle accelerator conference, Washington, DC (United States), 17-20 May 1993). Order Number DE95011198. Source: OSTI; NTIS; INIS; GPO Dep.

The escalating use of cryogens at national laboratories in general and accelerators in particular, along with the increased emphasis placed on personnel safety, mandates the development and installation of oxygen monitoring systems to insure personnel safety in the event of a cryogenic leak. Numerous vendors offer oxygen deficiency monitoring systems but fail to provide important features and/or flexibility. This paper describes a unique oxygen monitoring system developed for the Magnet Test Laboratory (MTL) at the Superconducting Super Collider Laboratory (SSCL). Features include: high reliability, oxygen cell redundancy, sensor longevity, simple calibration, multiple trip points, offending sensor audio and visual indication, global alarms for building evacuation, local and remote analog readout, event and analog data logging, EMAIL event notification, phone line voice status system, and multi-drop communications network capability for reduced cable runs. Of particular importance is the distributed topology of the system which allows it to operate in a stand-alone configuration or to communicate with a host computer. This flexibility makes it ideal for small applications such as a small room containing a cryogenic dewar, as well as larger systems which monitor many offices and labs in several buildings.

24291 (SSCL-Preprint–462) **Eddy current and quench loads and stress of SSC collider 4-K liner and the bore tube during magnet quench.** Leung, K.K.; Shu, Q.S. Superconducting Super Collider Lab., Dallas, TX (United States). Jul 1993. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-930703–47: International cryogenic materials conference (ICMC), Albuquerque, NM (United States), 12-16 Jul 1993). Order Number DE95011134. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the response of the eddy current and quench loads on a proposed Superconducting SuperCollider 4-K liner system. The liner within a bore tube is designed to remove the radiated power and the photodesorbed gas that impair the beam tube vacuum. The bimetallic liner tube is subjected to cooldown and eddy current loads. The square liner tube is a two-shell laminated Nitronic-40 steel is used for strength and a copper inner layer for low impedance to the image currents. Perforated holes are used to remove the photodesorbed gases for vacuum maintenance. The holes are located in a low-stress area of the liner. Rectangular holes in a four-pole symmetry pattern are required for beam dynamic stability. The liner is conductivity cooled by the round steel bore tube with a 2-mm wall. The copper layer must not be stressed over the yield strength limit because copper properties such as conductivity are known to change when the copper is stressed over yield strength. This analysis will address liner system response under thermal, eddy current, and vaporized liquid helium loads in a quenching dipole magnet.

24292 (SSCL-Preprint–540) **The SSCL framework software plans.** Frederiksen, S. Superconducting Super Collider Lab., Dallas, TX (United States). Dec 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011204. Source: OSTI; NTIS; INIS; GPO Dep.

In about ten years the Superconducting Super Collider Laboratory (SSCL) will be Producing 40 TeV proton-proton interactions. The size and scale of the effort demands new approaches to design and develop software used by the experimental collaborations. The Physics Research Division Computing Department (PRCD) of the SSCL is developing (in collaboration with the Solenoidal Detector Collaboration (SDC) and Gamma, Electron and Muon (GEM) collaborations a support system which will be used to build and run the collaboration software. It will be used for simulating the events needed for detector development and for the analysis of these complicated events. The plans status of this program will be discussed.

24293 (SSCL-Preprint–555) **Toward design of the Collider Beam Collimation System.** Drozhdin, A.; Mokhov, N.; Soundranayagam, R.; Tompkins, J. Superconducting Super Collider Lab., Dallas, TX (United States). Feb 1994. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011034. Source: OSTI; NTIS; INIS; GPO Dep.

A multi-component beam collimation system for the Superconducting Super Collider is described. System choice justification and design requirements are presented. System consists of targets, scrapers, and collimators with appropriate cooling and radiation shielding. Each component has an independent control for positioning and aligning with respect to the beam. Results of beam loss distribution, energy deposition calculations, and thermal analyses, as well as cost estimate, are presented.

24294 (SSCL-Preprint–556) **Accidental beam loss in superconducting accelerators: Simulations, consequences of accidents and protective measures.** Drozhdin, A.; Mokhov, N.; Parker, B. Superconducting Super Collider Lab., Dallas, TX (United States). Feb 1994. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011035. Source: OSTI; NTIS; INIS; GPO Dep.

The consequences of an accidental beam loss in superconducting accelerators and colliders of the next generation range from the mundane to rather dramatic, i.e., from superconducting magnet quench, to overheating of critical components, to a total destruction of some units via explosion. Specific measures are required to minimize and eliminate such events as much as practical. In this paper we study such accidents taking the Superconducting Supercollider complex as an example. Particle tracking, beam loss and energy deposition calculations were done using the realistic machine simulation with the Monte-Carlo codes MARS 12 and STRUCT. Protective measures for minimizing the damaging effects of prefire and misfire of injection and extraction kicker magnets are proposed here.

24295 (SSCL-SR–1211) **Workshop on data acquisition and trigger system simulations for high energy physics.** Superconducting Super Collider Lab., Dallas, TX (United States). [1992]. 578p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-9204304–: Workshop on data acquisition and trigger system simulations for high energy physics, Waxahachie, TX (United States), 23-25 Apr 1992). Order Number DE95011164. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the following topics: DAQSIM: A data acquisition system simulation tool; Front end and DCC Simulations for the SDC Straw Tube System; Simulation of Non-Blocking Data Acquisition Architectures; Simulation Studies of the SDC Data Collection Chip; Correlation Studies of the Data Collection Circuit & The Design of a Queue for this Circuit; Fast Data Compression & Transmission from a Silicon Strip Wafer; Simulation of SCI Protocols in Modsim; Visual Design with vVHDL; Stochastic Simulation of Asynchronous Buffers; SDC Trigger Simulations; Trigger Rates, DAQ & Online Processing at the SSC; Planned Enhancements to

MODSEM II & SIMOBJECT – an Overview – R.; DAGAR – A synthesis system; Proposed Silicon Compiler for Physics Applications; Timed – LOTOS in a PROLOG Environment: an Algebraic language for Simulation; Modeling and Simulation of an Event Builder for High Energy Physics Data Acquisition Systems; A Verilog Simulation for the CDF DAQ; Simulation to Design with Verilog; The DZero Data Acquisition System: Model and Measurements; DZero Trigger Level 1.5 Modeling; Strategies Optimizing Data Load in the DZero Triggers; Simulation of the DZero Level 2 Data Acquisition System; A Fast Method for Calculating DZero Level 1 Jet Trigger Properties and Physics Input to DAQ Studies.

24296 (SSC-SR–1004) **Superconducting Super Collider reference design magnets Style "D" cost design. Contents.** Yourd, R. Superconducting Super Collider Lab., Dallas, TX (United States). 1 Apr 1985. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011068. Source: OSTI; NTIS; GPO Dep.

This note describes a "Design D" style superconducting dipole magnet being studied for the SSC. This particular version of the design is being developed for initial manufacturing studies and reference cost estimate comparison. The main bending magnets are being considered in detail because they are the most costly elements of the machine and, therefore, require considerable R&D to verify performance and to develop the most economical design. Also to be described (but not in this note) are the quadrupole magnets, field correction magnets, and certain special magnets.

24297 (SSC-SR–1010) **Magnet Technical Review Panel. Final report.** Superconducting Super Collider Lab., Dallas, TX (United States). 25 Jul 1985. 133p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011074. Source: OSTI; NTIS; GPO Dep.

This report discusses the following topics on the Superconducting Super Collider: Present status of magnet technology; description of various magnet systems; development of superconducting wire and cable; and R&D program.

24298 (SSC-SR–1025) **Magnet measurement workshop.** Lawrence Berkeley Lab., CA (United States). SSC Central Design Group. Dec 1986. 126p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-8611319–Summ.: Superconducting Super Collider magnet measurement workshop, Berkeley, CA (United States), 18-20 Nov 1986). Order Number DE95011087. Source: OSTI; NTIS; GPO Dep.

This report covers the deliberations of the participants the workshop and some subsequent contributions. Section III, the report of the rotating coil group, includes a summary table of the major measuring systems in use today, with separate sections on each. Section IV is the summary report of the group that addressed other measuring techniques. Because one of the limits of all the techniques being considered is electronic data acquisition, Section V addresses this topic. A set of issues relevant to magnetic field measurements of SSC dipoles was raised and addressed during the workshop. These are included as Section VI. Section VII includes a complete list of attendees with their addresses and a separate list of the members of the two working groups.

24299 (ANL/APS/CP–84921) **Cooling the APS storage ring radio-frequency accelerating cavities: Thermal/stress/fatigue analysis and cavity cooling configuration.** Primdahl, K.; Kustom, R. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950512–198: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013405. Source: OSTI; NTIS; INIS; GPO Dep.

The 7-GeV Advanced Photon Source positron storage ring requires sixteen separate 352-MHz radio-frequency (rf) accelerating cavities. Cavities are installed as groups of four, in straight sections used elsewhere for insertion devices. They occupy the first such straight section after injection, along with the last three just before injection. Cooling is provided by a subsystem of the sitewide deionized water system. Pumping equipment is located in a building directly adjacent to the accelerator enclosure. A prototype cavity was fabricated and tested where cooling was via twelve 19-mm-diameter [3/4 in] brazed-on tubes in a series-parallel flow configuration. Unfortunately, the thermal contact to some tubes was poor due to inadequate braze filler. Here, heat transfer studies, including finite-element analysis and test results, of the Advanced Photon Source (APS) storage ring 352-MHz rf accelerating cavities are described. Stress and fatigue life of the copper are discussed. Configuration of water cooling is presented.

24300 (BNL–61191) **The RHIC accelerating cavity prototype tuner.** Ratti, A.; Brennan, J.M.; Brodowski, J.; Onillon, E.; Rose, J. Brookhaven National Lab., Upton, NY (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950512–139: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95011806. Source: OSTI; NTIS; INIS; GPO Dep.

The RHIC Accelerating System runs at 26.7 MHz and is required to have an operating range of 85 kHz during the acceleration cycle. Since it also must provide sufficient range to cover manufacturing errors and temperature variation, a requirement of 300 kHz has been specified. A mechanical approach acting on the cavity accelerating gap has been chosen for financial reasons over a ferrite approach. A prototype has been constructed and fully tested on the existing test cavity, using the tuning loop feedback circuitry developed for this task. Results from both the loop response and the power tests of the prototype indicate that this design will successfully meet the performance requirements for the RHIC Accelerating Cavity.

24301 (BNL–61848) **Orbit stability improvement at the NSLS x-ray ring.** Safranek, J.; Singh, O.; Solomon, L. Brookhaven National Lab., Upton, NY (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950512–166: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013234. Source: OSTI; NTIS; GPO Dep.

We describe recent improvements in both the short an long-term orbit stability at the NSLS X-Ray Ring. The short-term stability has been improved by increasing the gain and the bandwidth of the global harmonic feedback systems. The long-term horizontal orbit drift over the course of a fill has been reduced by including the rf-frequency in the orbit feedback. Work is in progress to further reduce orbit drift by compensating for thermally induced mechanical motions of the beam position monitors (BPMs).

24302 (BNL–61853) **Experimental determination of linear optics including quadrupole rotations.** Safranek, J. Brookhaven National Lab., Upton, NY (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950512–217: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013486. Source: OSTI; NTIS; INIS; GPO Dep.

The measured response matrix giving the change in orbit at beam position monitors (BPMs) with changes in steering magnet excitation can be used to accurately determine many important parameters in a storage ring. Using the NSLS X-Ray Ring measured response matrix we have determined the gradients in all 56 quadrupole magnets; the calibration of the steering magnets and BPMs; the rotational mis-alignments of the quadrupoles, steering magnets, and BPMs about the electron beam direction; the longitudinal magnetic centers of the orbit steering magnets; and the transverse mis-alignments of the sextupoles. Random orbit measurement error of the BPMs propagated to give 0.04% rms error in determination of individual quadrupole gradients and 0.4 mrad rms error in the determination of quadrupole rotational alignment. Small variations of a few parts in a thousand in the quadrupole gradients within an individual family were resolved. The improved understanding of the X-Ray Ring has enabled us to better control the electron beam size.

24303 (DOE/EA–0909) **Programmed improvements of the alternating gradient synchrotron complex at Brookhaven**

National Laboratory, Upton, New York. Environmental assessment. USDOE Assistant Secretary for Environmental Management, Washington, DC (United States). Mar 1994. 52p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95012130. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose and need for DOE to undertake the actions described in this document are to improve the efficiency of the Alternating Gradient Synchrotron (AGS) complex. Benefits would include optimization of the AGS scientific program, increased high-energy and nuclear physics experimentation, improved health and safety conditions for workers and users, reduced impact on the environment and the general public, energy conservation, decreased generation of hazardous and radioactive wastes, and completion of actions required to permit the AGS to be the injector to the Relativistic Heavy Ion Collider (RHIC)., Improved efficiency is defined as increasing the AGS's capabilities to capture and accelerate the proton intensity transferred to the AGS from the AGS booster. Improved capture of beam intensity would reduce the beam losses which equate to lost scientific opportunity for study and increased potential for radiation doses to workers and the general public. The action would also refurbish magnets used in the transfer tunnel which connects the AGS complex to RHIC to permit smooth injection of beam into the RHIC accelerator. These magnets were previously used to direct beam to fixed targets for high energy physics studies but have hot received proper maintenance to be reliable as injectors to RHIC. The document describes alternative actions, the affected environment, and environmental impacts.

24304 (JINR-D–9-92-455, pp. 43-50) **Status and development of UNK.** Myznikov, K.P. (Institut Fiziki Vysokikh Ehnergij, Protvino (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Present status of construction and development of the Serpukhov Tevatron is described. The construction of the 2.7 km long injection channel arranged between the U-70 and the UNK-1 is completed. The construction activities for the preparation of the extraction channel arranged between the U-70 and the injection channel are accomplished. The UNK 20.7 km long tunnel driving is completed. The vacuum chamber of the 16 km long ring regular section is produced. The 50% of waveguides are manufactured. The UNK-1 equipment is being tested. The batch of superconducting dipoles and correctors is being produced. 14 refs., 1 tab., 6 figs.

24305 (JINR-D–9-92-455, pp. 53-57) **Routine beam diagnostics with application of electrostatic beam monitors at VEPP-4 M storage ring.** Kalinin, A.S. (RAN Sibirskoe Otdelenie, Inst Yadernoj Fiziki im. G.I.Budkera, Novosibirsk (Russian Federation)); Simonov, E.A.; Shatilov, D.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The VEPP-4 M beam monitoring system comprising 54 beam monitors is described. The scheme of the pick-up station is given. The beam monitoring system is constructed in the CAMAC standard. One of the storage ring computer is used for beam monitoring. The accident short-circuit magnet was identified by means of the given beam monitoring system during beam transport. 4 refs., 1 fig.

24306 (JINR-D–9-92-455, pp. 78-81) **Suppression of resistive instability of a bunched beam in the UNK first stage using a digital recursive filter in the feedback circuit.** Zhabitskij, V.M. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Korenev, I.L.; Yudin, L.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Technique and new fast system of proton bunch beam coherent betatron oscillations suppression in the UNK first stage are suggested. The system comprises two beam monitors and two pushers. Differential equations are reduced to linear difference matrix equation which is investigated for stability using unilateral Z-transformation. 10 refs.

24307 (JINR-D–9-92-455, pp. 82-86) **Influence of errors in displacement of beam monitors and pushers on parameters of a system for suppression of resistive instability in the UNK first stage.** Zhabitskij, V.M. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Chernov, P.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Influence of errors in the displacement of beam monitors (BM) and magnetic pushers (MP) in the system of betatron oscillations suppression at the UNK first stage is investigated. The system comprises two beam monitors and two pushers. The analysis showed that difference in betatron oscillation phase carry-over from $\pi/2$ radian at short intervals between BM and MP having similar sign worsens the conditions of coherent betatron oscillation suppression stronger than at different sign errors. 9 refs.

24308 (JINR-D–9-92-455, pp. 87-88) **Organization of a control system of beam transverse motion in the UNK first stage.** Ganbat, G. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Glejbman, Eh.M.; Pilyar, N.V.; Rukoyatkina, T.V.; Koroleva, G.E. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

On-line system designed for controlling transversal beam motion in the UNK first stage is described. The system provides measurement of beam longitudinal part deflection from the center of vacuum chamber, operative data processing and generating correction signals. The system has the two-level structure. The lower level has three subsystems. Subsystems are based on the UNK CM 1810 programmable controllers and operate via the CM 1820 central computer. 3 refs.

24309 (JINR-D–9-92-455, pp. 89-92) **On the possibility of using the TMS 32010 and the TMS 32025 type signal processors in the feedback circuit for control of beam transverse motion in the UNK first stage.** Glejbman, Eh.M. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Problems of the application of the TMS 32010 and the TMS 32025 microprocessors in the UNK first stage beam feedback system are considered. These processors have a common bus of data reception (from analog-to-digital processor) and data transmission (to digital-to-analog processor) and are synchronized by a common clock generator. The number of used processors in a cascade depends on both algorithm (the number of command lines in a program) and on processor operating efficiency. 5 refs., 1 fig.

24310 (JINR-D–9-92-455, pp. 131-133) **Heavy Ion accelerating-storage complex (IYal, Kiev).** Val'kov, A.E. (Inst Yadernykh Issledovanij, Kiev (Ukraine)); Vishnevskij, I.N.; Dolinskij, A.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The description of the heavy-ion accelerating-storage complex (ASC) which is under development at the Kiev Institute for Nuclear Research is presented. ASC comprises the U-240 isochronous synchrotron as an injector into a fast booster and a synchrotron storage-ring. ASC will provide operation with nuclei and with ions in a wide range of masses (from protons to xenon) at the energy of up to 300 MeV/nucleon (A/Z = 2) at a high luminosity. The ASC scheme and parameters are presented. 1 tab., 2 figs.

24311 (JINR-D–9-92-455, pp. 265-268) **Results of calculation of thermoelastic deformations of UNK injection system 'URAL-60' linac accelerating structures.** Grushichev, I.A. (Institut Fiziki Vysokikh Ehnergij, Protvino (Russian Federation)); Popovkin, V.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Analysis of thermoelastic deformations due to thermal load of accelerating structure elements of the 'URAL-60' linear accelerator - the UNK injector is performed. Requirements for a cooling system of the accelerator operating in the pulse-train mode in the air temperature range of 15 - 20 deg C are formulated. 10 refs., 1 tab., 6 figs.

24312 (JINR-D–9-92-455, pp. 299-302) **Experimental study on high-voltage nanosecond generators of the 'Sibir'-2' storage ring injection system.** Kadnikov, A.A. (GosNII Fizicheskikh Problem im. F.V.Lukina, Moscow (Russian Federation)); Matveev, Yu.G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Results of the investigation of operating modes of pulse generators of the injection system of the 'Sibir'-2' storage ring the synchrotron radiation source are presented. Generators are constructed as coaxial type double-shaping lines with the control via the gas-filled three-electrode spark gaps. Test results revealed, that generators meet the requirements to output voltage of up to 60 kw, pulse rise time of about 3 ns and timing stability. 1 ref., 3 figs.

24313 (JINR-D–9-92-455, pp. 305-308) **Lenses magnetooptical stability to their geometry perturbations.** Bulyak, E.V. (Khar'kovskij Fiziko-Tekhnicheskij Inst, Kharkov (Ukraine)); Mytsykov, A.O. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The method of specifying tolerances of geometric sizes variation and the alignment of multiple lenses at storage rings is suggested and tested. The method is based on estimating multipole harmonics amplitudes mostly effecting beam dynamics at a storage ring. Amplitudes of the given harmonics are determined by the maximum likelihood method using the calculations. The computer code based on the suggested method is developed. Computer code test results are presented. 5 refs., 5 figs.

24314 (JINR-D–9-92-455, pp. 361-366) **Dipole and quadrupole magnets of the K4 ring of the K4 - K10 heavy ion storage complex.** Vakhromeev, Yu.M. (Nauchno-Issledovatel'skij Inst Ehlektrofizicheskoj Apparatury im. D.V.Efremova, Sankt-Peterburg (Russian Federation)); Edovin, I.V.; Kashikhin, V.S.; Myasnikov, Yu.A.; Popov, A.V.; Severgin, Yu.P.; Solames, A.A.; Stepin, E.P.; Shilkin, NJoint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The K4 facility is the fast storage ring with electron cooling designed for the acceleration and storage of practically all types of heavy ions. The U - 400M isochronous cyclotron is the injection of the storage ring. The ring electromagnetic system comprising dipole and quadrupole magnets creating 1.4 T field and 6.5 T/m gradient correspondingly is described. All magnets will be produced from blended cold-rolled electrolytic steel of 0.7 mm thick with surface insulation coating. Magnetic circuit sheets are stamped which allow one to obtain high accuracy of the production. 2 refs., 2 tabs., 2 figs.

24315 (JINR-D–9-92-455, pp. 369-374) **Present status at the VEPP - 4 M.** Anashin, V.V. (RAN Sibirskoe Otdelenie, Inst Yadernoj Fiziki im. G.I. Budkera, Novosibirsk (Russian Federation)); Anchugov, O.V.; Belomestnykh, S.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Present status of the VEPP - 4 upgrading is described. Non disturbing method of β-function measurement is worked out. The KEDR detector mounting is under way. The detector is designed for the solution of upsilon physics problems. The accelerator control system response is investigated. Orbit correction problems are being solved. 7 refs., 1 tab., 4 figs.

24316 (JINR-D–9-92-455, pp. 375-378) **Measurements of electron beam vertical vibrations and earth oscillations at the VEPP - 3 storage ring.** Lebedev, V.A. (RAN Sibirskoe Otdelenie, Inst Yadernoj Fiziki im. G.I. Budkera, Novosibirsk (Russian Federation)); Lebedev, P.K.; Parkhomchuk, V.V.; Chil'tsev, V.D. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Results of two-day measurements of electron beam oscillations and earth vertical vibrations at the VEPP - 3 are presented. Beam motion is shown to be connected and well correlated with accelerator magnetic elements vibrations at frequencies of lower than 40 - 50 Hz. At high frequencies, beam position fluctuations are determined mainly by instabilities of magnet and corrector supplying current. 4 refs., 5 figs.

24317 (JINR-D–9-92-455, pp. 379-382) **Study on seismic noise effect on electron beam parameters of the 'Zelenograd' specialized synchrotron radiation source.** Kuznetsov, S.I. (GosNII Fizicheskikh Problem im. F.V.Lukina, Moscow (Russian Federation)); Valentinov, A.G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Results of measurements of quadrupole lens mechanical vibrations and electron beam displacement at the Zelenograd specialized synchrotron radiation source are presented. 4 refs., 3 figs.

24318 (JINR-D–9-92-455, pp. 383-392) **C-tau factory of the JINR accelerating-storage complex.** Aleksandrov, V.S. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Antropov, V.K.; Arkhipov, O.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The description of the JINR accelerating-storage complex C-tau factory with the designed peak energy of 2.5 GeV is presented. The RF comprises four superconducting cavity resonators placed at the ends of long rectilinear gaps; the operation frequency is 4.76 MHz. Beam longitudinal size is 7 mm. Each arch comprises 12 cells of the FODO type periodicity. Wiggler magnets having 1.7 magnetic field and full length of 5.2 m designed for emittance

variation are placed at the regions of dispersion suppression. Parameters of the C-tau factory and some elements of the accelerating-storage complex are given. 5 refs., 2 tabs., 8 figs.

24319 (JINR-D–9-92-455, pp. 393-396) **Rearrangeable magnets structure of the C-tau factory with flat beam and monochromatization schemes.** Belovitskij, P.F. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The rearrangeable magnetic structure of the C-Tau factory is described and suggested. This magnetic structure provides the operation both with flat beam and electron-positron colliding beam energy monochromatization schemes. The rearrangement of magnetic structure is made at the expense of betatron oscillations phases overlapping in the FODO periodicity element and by means of wiggler magnets application. 7 refs., 1 tab., 2 figs.

24320 (JINR-D–9-92-455, pp. 397-400) **Storage-cooling ring for injection complex of F- and B-factories.** Anashin, V.I. (RAN Sibirskoe Otdelenie, Inst Yadernoj Fiziki im. G.I. Budkera, Novosibirsk (Russian Federation)); Belomestnykh, S.A.; Voroshilov, A.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The description of a magnetic structure of the cooling-storage ring of the F- and the B-factories is presented. The storage ring magnetic structure is a mirror-symmetrical about perpendicular axes crossing the centers of rectilinear gaps and comprises four quadrants. The storage ring admittances are chosen to be 10 mrad x cm and 4 mrad x cm to the horizontal and in the vertical planes correspondingly. The injection scheme suggested the usage of vertical septum-magnets with direct-current magnetic field and the radial bump of a kicker magnet. 1 ref., 2 tabs., 3 figs.

24321 (JINR-D–9-92-455, pp. 401-404) **HP - 2000. Present status.** Androsov, V.P. (UNTs Khar'kovskogo Fiziko-Tekhnicheskogo Instituta, Kharkov (Ukraine)); Bulyak, E.V.; Gladkikh, P.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Present status of the development and testing of the HP - 2000 stretcher separate systems is given. R and D project of the ring vacuum system is developed. The production of the equipment for dipole magnet chamber forming has begun. The 100 kw, 699.3 MHz klystron is produced and tested. The full-scale functional model of a five-resonator accelerating section is produced. Beam position monitors are produced too. 3 refs., 1 fig.

24322 (JINR-D–9-92-455, pp. 405-408) **Longitudinally polarized electron beam at the internal target of the pulse stretcher ring HP - 2000.** Zelinskij, A.Yu. (Khar'kovskij Fiziko-Tekhnicheskij Inst, Kharkov (Ukraine)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The scheme designed for the production of a linear-polarized electron beam in the interaction point with the internal target of the HP - 2000 stretcher ring in the range of electrons of 0.5 - 3 GeV is described. The designs of a solenoidal spin-rotator of the injection channel and the 'Siberian snake' are developed. 6 refs., 3 figs.

24323 (JINR-D–9-92-455, pp. 413-415) **Dynamic aperture measurement at the H-100 Kharkov storage ring.** Zelinskij, A.Yu. (Khar'kovskij Fiziko-Tekhnicheskij Inst, Kharkov (Ukraine)); Mocheshnikov, N.I.; Reprintsev, L.V.; Shcherbakov, A.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Results of measuring dynamic aperture of the Kharkov 100 - MeV H - 100 electron storage ring are presented. Beam lifetime depending on the variation of geometric aperture has been measured. The dynamic aperture is measured by means of incoherent betatron oscillation excitation induced by magnetic field pulses which repetition rate was chosen lesser than betatron oscillation frequency and the duration less than rotation period. Thus for radial plane the measured aperture is 7 mm which coincide well with measurements during shutters position variation. 4 refs., 2 figs.

24324 (JINR-D–9-92-455, pp. 416-418) **Status of the ROKK - 1 M facility at the VEPP - 4 M storage ring.** Kezerashvili, A.M. (RAN Sibirskoe Otdelenie, Inst Yadernoj Fiziki im. G.I.Budkera, Novosibirsk (Russian Federation)); Milov, A.M.; Muchnoj, N.Yu.; Usov, A.P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The description of the ROKK - 1 M facility (backscattered compton photons) which is under construction at the VEPP - 4 M and designed for experiments with using laser photons compton backscattering on high-energy electrons is presented. The ROKK - 1 M is designed for providing operative measurement of electron polarization at the storage ring with the accuracy of 10% during 30 s. The laser system comprises two Nd : YAG lasers operating at the fundamental wave length of 106 nm and at the double wave length of 532 nm. Laser radiation optical optical transport channel length is 40 m and 60 m -for electron and positron directions correspondingly. 1 fig.

24325 (JINR-D–9-92-455, pp. 427-430) **Experimental study on collective effects in the VEPP - 3 storage ring in centimeter length range of a bunch.** Belomestnykh, S.A. (RAN Sibirskoe Otdelenie, Inst Yadernoj Fiziki im. G.I.Budkera, Novosibirsk (Russian Federation)); Voroshilov, A.N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The behaviour of a charged particle bunch in the range of its length of several centimeters at the VEPP - 3 during high current accumulation is studied. The bunch length, its cross-section dimension and equilibrium phase shift depending on current at different energies have been measured. The measured bunch length to current ratio is well coincide with theoretical prediction of the elongation by solving the balance equation where real and imaginary parts of impedance are comparable between each other. The bunch heating with current increase was not observed. The value of wide-band longitudinal impedance having inductive and resistive components is determined. 7 refs., 1 tab., 6 fogs.

24326 (JINR-D–9-92-455, pp. 431-434) **Preparation to the experiment on two-beam acceleration at the JINR High-Energy Physics Laboratory.** Bulanov, V.A. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Golubev, I.I.; Kaminskij, A.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

The status of a two-beam accelerating facility basic elements is considered. The facility comprises the 1.5 MeV LIU - 3000 induction linac having the designed beam current of 75 A and beam

power of 10 MW, free-electron laser (FEL), an injector and a high-gradient accelerating structure. The results of first experiments at FEL in the mode of amplification and generation are presented. 6 refs., 1 tab.

24327 (JINR-D–9-92-455, pp. 460-463) **Ion drift in electron beams.** Bulyak, E.V. (Khar'kovskij Fiziko-Tekhnicheskij Inst, Kharkov (Ukraine)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 500p. (In Russian). (CONF-9210224–: 13. national particle accelerator conference, Dubna (Russian Federation), 13-15 Oct 1992). In *Proceedings of the 13. workshop on charged particle accelerators. Volume 1.* Order Number DE95633506. Source: OSTI; NTIS (US Sales Only); INIS.

Effects induced during intense electron beam interaction with accumulated positive ions of a residual gas at an electron storage ring are considered. Estimates of ion skeleton density depending on residual gas density at the presence of ion removal plates are presented. Ion density distribution in axial plane in respect to beam orbit is considered. 3 refs., 2 figs.

24328 (LBL–35890) **A design method for multiple tube gas-cooled electrical leads for the g-2 superconducting magnets.** Green, M.A. (Lawrence Berkeley Lab., CA (United States)); Jia, L.X.; Addessi, L.J.; Cullen, J.R. Jr.; Esper, A.J.; Meier, R.E. Lawrence Berkeley Lab., CA (United States). Dec 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016 ; AC03-76SF00098. (CONF-950722–2: Cryogenic engineering conference and international cryogenic materials conference, Columbus, OH (United States), 17-21 Jul 1995). Order Number DE95014787. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents a method for designing 5300 A gas cooled electrical leads for the g-2 solenoids and 2850 A leads for the g-2 self shielded inflector dipole magnet. Empirical design equations for annular tube gas cooled leads are presented. The leads are bundled tube leads which are cooled by helium flowing in annular cooling passages between tubes. Each tube in the bundle consists of nested circular copper tubes that can be cooled on both sides. Multiple current carrying tubes will increase the lead current capacity and cooling the tubes on both sides will increase lead efficiency for a given helium flow pressure drop. The design method presented here can applied to leads made from a variety of materials.

24329 (LS–109) **A positron accumulator ring for APS.** Crosbie, E.A. Argonne National Lab., IL (United States). Mar 1988. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95015571. Source: OSTI; NTIS; GPO Dep.

The new positron injection scheme is as follows. The cycle rate of the injector synchrotron is increased to 2 Hz. During 0.4 sec of each 0.5-sec synchrotron cycle, 24 linac pulses are injected into the horizontal phase space of the PAR at a 60-Hz rate. Each injected pulse occupies about 1/3 of the circumference of the accumulator ring. After 0.1 sec for longitudinal damping, the single accumulated bunch is transferred into one of the 352.96-MHz buckets of the injector synchrotron RF system. This single bunch is accelerated to 7 GeV and transferred into the storage ring while the PAR accumulates the next bunch of positrons. The injector synchrotron requires only the one high-frequency RF system.

24330 (LS–155) **3-D computer simulations of EM field sin the APS vacuum chamber. Part 2: Time-domain analysis.** Chou, W. Argonne National Lab., IL (United States). 20 Jan 1989. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95015572. Source: OSTI; NTIS; GPO Dep.

Our simulations suggest that the strong peak around 4 GHz in the narrow gap observed in the measurements is generated by TE modes. Therefore, one should not worry about this peak insofar as the coupling impedance is concerned. On the other hand, some discrepancies between our simulations and the measurements are noticed and remain to be resolved.

24331 (LS–177) **Loss parameter calculations.** Cook, J.M. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015497. Source: OSTI; NTIS; GPO Dep.

Sands and Rees propose an electronic bench measurement of the impulse energy loss of a stored particle bunch to vacuum-chamber components. The components act as the outer conductor of a coaxial line with a thin wire as center conductor. Short pulses are then transmitted through this coaxial system to simulate relativistic particle bunches. Their proposal has since been implemented by several investigators and has become a well-known technique. They derive a first-order approximation to the loss parameter κ for use in these measurements. The purpose of this note is to point out that exact expression for κ is as simple as its first-order approximation and to recommend its use even when κ is small.

24332 (LS–189) **Thermal and mechanical measurements of the prototype SR quadrupole.** Lopez, F. Argonne National Lab., IL (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015203. Source: OSTI; NTIS; INIS; GPO Dep.

The magnet warm-up time and motion of the alignment fiducials was investigated. Type K thermocouples were used to measure the temperature of the magnet steel, ambient, and supply and return H_2O. The vertical position of alignment targets was measured using optical levels. A laser position-sensitive laser detector was placed on top of the magnet, and the motion of the detector with respect to a laser (part of the Danfysik measurement bench) was recorded.

24333 (LS–214) **Fourth-integral resonance study on Aladin at SRC.** Liu, J. (Argonne National Lab., IL (United States)); Crosbie, E.; Teng, L.; Bridges, J.; Ciarlette, D.; Symon, K.; Trzeciak, W. Argonne National Lab., IL (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015393. Source: OSTI; NTIS; INIS; GPO Dep.

The fourth-integral betatron resonance driven by sextupoles was studied on the electron storage ring Aladdin at SRC. The resonance feature of capturing the phase space particles in the resonance islands was dearly demonstrated. In a computer simulation, the finite beam size is simulated by multi-particle tracking and the decoherence of the betatron oscillation was shown to agree well with experiment observation.

24334 (LS–220) **Survey and alignment report on the primary control network for the APS.** Friedsam, H.; Penicka, M.; Zhao, S. Argonne National Lab., IL (United States). Feb 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015211. Source: OSTI; NTIS; INIS; GPO Dep.

During November 1992 the survey and alignment team measured the entire primary control network for the APS. This task had to be finished before the enclosure of the EAA and the RF buildings were put in place, inhibiting several lines of sight necessary for the determination of the monument locations.

24335 (SLAC-PUB–95-6812) **Transport construction status and commissioning plans.** Fieguth, T. (and others); Bloom, E.; Donaldson, T. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jun 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515 ; AC03-76SF00098. (CONF-950512–188: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995; LBL–37045). Order Number DE95014650. Source: OSTI; NTIS; INIS; GPO Dep.

Installation of the PEP-II electron and positron Injection beamlines in the SLAC linac housing is now underway. Utilization of the existing high power, low emittance beams available at SLAC required that a great portion of the systems for pulsed extraction and transport of 9.0 GeV electrons and 3.1 GeV positrons for injection into the PEP-II rings will reside in the existing linac housing. Approximately 4.7 kilometers of these beamlines will be completed during the summer of 1995. All components, including orbit correctors and diagnostic instruments, required for extraction and transport of the electron beam will be in place and ready for commissioning as soon as this fall. The positron transport line in the

housing will also be complete except for the pulsed extraction system. These systems are described, along with the status of the construction and installation of the important subsystems such as magnets and power supplies, vacuum systems, instrumentation and controls. The plan for commissioning is discussed.

24336 (SLAC-PUB–95-6897) **High-power RF window and coupler development for the PEP-II B Factory.** Neubauer, M. (Stanford Linear Accelerator Center, Menlo Park, CA (United States)); Fant, K.; Hodgson, J.; Judkins, J.; Schwarz, H.; Rimmer, R.A. Stanford Linear Accelerator Center, Menlo Park, CA (United States). May 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515 ; AC03-76SF00098. (LBL–37250; CONF-950512–174: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013377. Source: OSTI; NTIS; INIS; GPO Dep.

We describe the fabrication and testing of the RF windows designed to transmit power to the PEP-II 476 MHz cavities. Design choices to maximize the reliability of the window are discussed. Fabrication technologies for the window are described and finite-element analysis of the assembly process is presented. Conditioning and high-power testing of the window are discussed. Design of the coupler assembly including the integration of the window and other components is reported.

24337 (SLAC-PUB–95-6901) **Design of traveling wave windows for the PEP-II RF coupling network.** Kroll, N.M.; Ng, C.K.; Judkins, J.; Neubauer, M. Stanford Linear Accelerator Center, Menlo Park, CA (United States). May 1995. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515 ; FG03-93ER40759. (CONF-950512–168: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013369. Source: OSTI; NTIS; INIS; GPO Dep.

The waveguide windows in the PEP-II RF coupling network have to withstand high power of 500 kW. Traveling wave windows have lower power dissipation than conventional self-matched windows, thus rendering the possibility of less stringent mechanical design. The traveling wave behavior is achieved by providing a reflecting iris on each side of the window, and depending on the configuration of the irises, traveling wave windows are characterized as inductive or capacitive types. A numerical design procedure using MAFIA has been developed for traveling wave windows. The relative advantages of inductive and capacitive windows are discussed. Furthermore, the issues of bandwidth and multipactoring are also addressed.

24338 (SLAC-PUB–95-6902) **Impedance spectrum for the PEP-II RF cavity.** Lin, X.E.; Ko, K.; Ng, C.K. Stanford Linear Accelerator Center, Menlo Park, CA (United States). May 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-950512–173: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013376. Source: OSTI; NTIS; INIS; GPO Dep.

The impedance spectrum presented by the PEP-II RF cavity to the beam is calculated using a 3D MAFIA model which includes the damping waveguides and the input coupler. The simulation assumes that all the ports leading out of the cavity, including the beam Pipes, are terminated in matched loads. The effect of the external loading on the longitudinal impedances will be examined. This study takes into account the input coupler damping which has not been considered in previous calculations.

24339 (UCRL-JC–119407) **Test results of a combined distributed ion pump/non-evaporable getter pump design developed as a proposed alternative pumping system for the PEP-II asymmetric B-Factory collider.** Holdener, F. (Lawrence Livermore National Lab., CA (United States)); Behne, D.; Hathaway, D. Lawrence Livermore National Lab., CA (United States); Stanford Linear Accelerator Center, Menlo Park, CA (United States). 24 Apr 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ; AC03-76SF00515. (CONF-950512–249: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95014389. Source: OSTI; NTIS; INIS; GPO Dep.

The authors have built and tested an all-in-one combination plate-type distributed ion pump/non-evaporable getter pump design (DIP/NEG) considered as a proposed alternative pumping system for the PEP-II B-Factory High Energy Ring (HER). The DIP portion of the design used a Penning cell hole size of 12 mm in a mostly uniform magnetic field of 0.18 T. The NEG portion of the design used commercially available non-evaporable getter material type St-707™. A detailed description of the design is presented along with results of pumping speed measurements.

24340 (UCRL-JC–119408) **Test results of pre-production prototype distributed ion pump design for the PEP-II Asymmetric B-Factory collider.** Holdener, F.R. (and others); Behne, D.; Hathaway, D. Lawrence Livermore National Lab., CA (United States). 24 Apr 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950512–213: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013265. Source: OSTI; NTIS; INIS; GPO Dep.

We have built and tested a plate-type pre-production distributed Ion Pump (DIP) for the PEP-II B-Factory High Energy Ring (HER). The design has been an earlier design to use less materials and to costs. Penning cell hole sizes of 15, 18, and 21 mm have been tested in a uniform magnetic field of 0.18 T to optimize pumping speed. The resulting final DIP design consisting of a 7-plate, 15 mm basic cell size anode was magnetic field of the HER dipole. A description of the final optimized DIP design will be presented along with the test results of the pumping speed measurements.

24341 (UCRL-JC–120158) **PEP-III magnet power conversion systems: Power supplies for large magnet strings.** Jackson, T. (Lawrence Berkeley Lab., CA (United States)); Saab, A.; Shimer, D. Lawrence Livermore National Lab., CA (United States); Stanford Linear Accelerator Center, Menlo Park, CA (United States); Lawrence Berkeley Lab., CA (United States). May 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ; AC03-76SF00098 ; AC03-76SF00515. (CONF-950512–178: Particle accelerator conference, Dallas, TX (United States), 1-5 May 1995). Order Number DE95013425. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents the cooperative design efforts of LBL, SLAC, and LLNL on the magnet power conversion systems for PEP-II. The systems include 900 channels of correction magnet bipolar supplies and 400 unipolar supplies in the range of 5 to 500 kW. We show the decision process and technical considerations influencing the choice of power supply technologies employed. We also show the development of specifications that take maximum advantage of both the resources available and existing facilities while at the same time satisfying tight constraints for cost control, scheduling and coordination of different working groups. Switch-mode power conversion techniques will be used extensively in these systems, from the corrector supplies to the largest units if the dynamic performance specifications demand it. General system descriptions for each of the power supply ranges and for a new common control system interface and regulator are included.

24342 (ANL-HEP-TR–94-04) **A possible level 0 trigger scheme for the STAR EMC.** Underwood, D. Argonne National Lab., IL (United States). May 1994. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95013384. Source: OSTI; NTIS; INIS; GPO Dep.

We propose a level 0 trigger for the STAR Electromagnetic Calorimeter, EMC, which provides a global energy sum and sums over cells appropriate for triggering on direct gammas and jets. It is implemented in analog at low level and digitally with FPGA's at higher level. It will provide trigger information in less than 800 nanoseconds.

24343 (ANL-HEP-TR-95-39) **Technical specification for plate fabrication for the ATLAS Tile Hadron Calorimeter.** Hill, N.F. Argonne National Lab., IL (United States). 13 Jun 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95015824. Source: OSTI; NTIS; INIS; GPO Dep.

The Atlas Collaboration, at the European Organization for Nuclear Research (CERN), proposes to build a general purpose proton-proton detector for the Large Hadron Collider (LHC), located in Geneva, Switzerland. The ATLAS collaboration consists of approximately 100 international institutions (universities and research laboratories) with a worldwide distribution. The ATLAS detector includes a large scintillating tile calorimeter using iron as the absorber material. This detector will be used to identify and measure the by-products of proton-proton collisions that occur at the symmetric center. The design of this detector is unique in that the absorber plates are oriented perpendicular to the colliding beam axis, rather than parallel, as is done in most other similar detectors to date. A simplified view of the detector is shown in the figure below.

24344 (ANL/IPNS/CP–86627) **Gas detectors for neutrons.** Crawford, R.K. Argonne National Lab., IL (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. (CONF-9506185–2: New tools for neutron instrumentation workshop, Les Houches (France), 6-10 Jun 1995). Order Number DE95013738. Source: OSTI; NTIS; INIS; GPO Dep.

The principles involved in gas detectors for neutrons and the techniques for position encoding in such detectors are reviewed. This forms the basis for a discussion of the limitations on gas detector position resolution and maximum data rates, and of the aging effects in such detectors. Current capabilities and possible areas for improvement are noted.

24345 (BNL–61687) **Temperature stimulated reverse annealing of neutron induced damage in high resistivity silicon detectors.** Li, Z. (Brookhaven National Lab., Upton, NY (United States)); Li, C.J.; Verbitskaya, E.; Eremin, V. Brookhaven National Lab., Upton, NY (United States). Mar 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-951073–1: IEEE nuclear science symposium and medical imaging conference, San Francisco, CA (United States), 21-28 Oct 1995). Order Number DE95012086. Source: OSTI; NTIS; INIS; GPO Dep.

Neutron irradiated high resistivity silicon detectors have been subjected to elevated temperature annealings (ETA). It has been found that both detector full depletion voltage and leakage current exhibit reverse annealing behavior for highly irradiated detectors: increase with ETA. Laser induced current shapes have indicated a net increase of acceptor type space charges associated with the full depletion voltage increase after ETA. Data of current deep level transient spectroscopy (I-DLTS) have shown that the dominant microscopic effect is the increase of a level at 0.39 eV. This level is tentatively identified as the V-V^- level at E_c-0.39 eV and/or the C_i-O_i level at E_v + 0.36 eV. Data of thermally stimulated current (TSC) have shown increases of levels at 0.26 eV and 0.40 eV with ETA, suggesting that the level responsible for the reverse annealing effects be the V-V center (V-V^- at E_c-0.25 eV and V-V^- at E_c-0.39 eV). Some local, non-uniform trappings of laser induced electrons and holes have been observed near the pt contact at low voltages after ETA at intermediate temperatures (110–150 °C).

24346 (CIEMAT–758) **Background characterization in a liquid scintillation spectrometer.** Rodriguez Barquero, L.; Los arcos, J.M.; Jimenez de Mingo, A. No corporate text available. 1995. 26p. (In Spanish). Order Number DE95780845. Source: OSTI; NTIS; INIS.

An alternate procedure for background count rate estimation in a liquid scintillation spectrometer is presented, which does not require to measure a blank with similar composition, volume and quench, to the problem sample. The procedure is based on a double linear parameterization which was obtained from a systematic study of the background observed with glass vials, in three different windows, 0-20 KeV, 0-800 KeV and 0-2 MeV, for volume between 2 and 20 ml of three commercial scintillators, Hisafe II, Ultima-gold and Instagel, and quenching degree in the interval equivalent to 50%-3% tritium efficiency. This procedure was tested with standard samples of ^{3}H, and led to average discrepancies less than 10% for activity => 0,6 Bq, against conventional methods for which the discrepancies are twice on average.

24347 (CONF-950209–10) **Non-conventional passive sensors for monitoring tritium on surfaces.** Gammage, R.B. (Oak Ridge National Lab., TN (United States). Health Sciences Research Div.); Brock, J.L.; Meyer, K.E. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 4. international symposium on field screening methods for hazardous wastes and toxic chemicals; Las Vegas, NV (United States); 22-24 Feb 1995. Order Number DE95013356. Source: OSTI; NTIS; INIS; GPO Dep. TTP/OR158102.

The authors describe development of small passive, solid-state detectors for in-situ measurements of tritium, or other weak beta-emitting radionuclides, on surfaces. One form of detector operates on the principle of thermally stimulated exoelectron emission (TSEE), the other by discharge of an electret ion chamber (EIC). There are currently two specific types of commercially available detector systems that lend themselves to making surface measurements. One is the thin-film BeO on a graphite disc, and the other is the Teflon EIC. Two other types of TSEE dosimeters (ceramic BeO and carbon doped alumina) are described but lack either a suitable commercially available reader or standardized methods of fabrication. The small size of these detectors allows deployment in locations difficult to access with conventional windowless gas-flow proportional counters. Preliminary testing shows that quantitative measurements are realized with exposure times of 1–10 hours for the TSEE dosimeters (at the DOE release guideline of 5,000 dpm/100 cm^2 for fixed beta contamination). The EIC detectors exhibit an MDA of 26,000 dpm/100 cm^2 for a 24 hour exposure. Both types of integrating device are inexpensive and reusable. Measurements can, therefore, be made that are faster, cheaper, safer, and better than those possible with baseline monitoring technology.

24348 (CONF-951073–2) **A flexible analog memory address list manager/controller for PHENIX.** Ericson, M.N.; Walker, J.W.; Britton, C.L.; Wintenberg, A.L.; Young, G.R. Oak Ridge National Lab., TN (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From IEEE nuclear science symposium and medical imaging conference; San Francisco, CA (United States); 21-28 Oct 1995. Order Number DE95012875. Source: OSTI; NTIS; INIS; GPO Dep.

A programmable analog memory address list manager/controller has been developed for use with all analog memory-based detector subsystems of PHENIX. The unit provides simultaneous read/write control, cell write-over protection for both a Level-1 trigger decision delay and digitization latency, and re-ordering of AMU addresses following conversion, at a beam crossing rate of 112 ns. Addresses are handled such that up to 5 Level-1 events can be maintained in the AMU without write-over. Data tagging is implemented for handling overlapping and shared beam event data packets. Full usage in all PHENIX analog memory-based detector sub-systems is accomplished by the use of detector-specific programmable parameters – the number of data samples per Level-1 trigger valid and the swnple spacing. Architectural candidates for the system are discussed with emphasis on implementation implications. Details of the design are presented including design simulations, timing information, and test results from a full implementation using programmable logic devices.

24349 (CONF-951073–4) **Post-radiation memory correction using differential subtraction for Phenix.** Britton, C.L. Jr.; Wintenberg, A.L.; Womac, M.; Kennedy, E.J.; Smith, R.S.; Young, G.R.; Awes, T.C. Oak Ridge National Lab., TN (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From IEEE nuclear science symposium and medical imaging conference; San Francisco, CA (United States); 21-28 Oct 1995. Order Number DE95012878. Source: OSTI; NTIS; INIS; GPO Dep.

In colliders such as RHIC, the radiation levels are well below those of colliders such as LHC. The problem is that there can be enough radiation at the inner detector (Multiplicity-Vertex Detector or MVD) to significantly affect a low-priced, nonradiation-hard

CMOS process. If the radiation affects the entire analog memory in a uniform fashion, then a real-time correction should be able to be performed to correct any changes seen in the memory and also the induced correlated noise from detector pickup thus precluding the need for a more expensive rad-hard process. This paper will present testing on memories fabricated in a 'soft' process and exposed to ionizing radiation. We used a single pipeline as a reference to be subtracted in a cell-by-cell basis from each pipe during read out and investigated the spatial effects of using different pipes for the reference. Use of this method reduced the noise which was common to all pipes (common-mode noise) and thus reduced both common-mode input noise and pattern noise generated from address lines being exercised on the AMU. The correlation across the memories (6-, 8-, and 16-channel AMUs fabricated in the Orbit 1.2μ CMOS process) vs. radiation dose was found to be quite good. Both pre-and post-radiation results are presented on systems designed for PHENIX and WA98 at CERN as well as measured results on the minimization of the effects of injected systematic noise.

24350 (CTH-RF–109) **Utilization of low voltage D-T neutron generators in neutron physics studies.** Singkarat, S. Chalmers Univ. of Technology, Goeteborg (Sweden). Dept. of Reactor Physics. 1995. 98p. Order Number DE95632454. Source: OSTI; NTIS; INIS.

In a small nuclear laboratory of a developing country a low voltage D-T neutron generator can be a very useful scientific apparatus. Such machines have been used successfully for more than 40 years in teaching and scientific research. The original continuous mode 150-kV D-T neutron generator has been modified to have also a capability of producing 2-ns pulsed neutrons. Together with a carefully designed 10 m long flight path collimator and shielding of a 25 cm diameter · 10 cm thick BC-501 neutron detector, the pulsing system was successfully used for measuring the double differential cross-section (DDX) of natural iron for 14.1-MeV neutron from the angle of 30 deg to 150 deg in 10 deg steps. In order to extend the utility of the generator, two methods for converting the almost monoenergetic 14-MeV neutrons to monoenergetic neutrons of lower energy were proposed and tested. The first method uses a pulsed neutron generator and the second method uses an ordinary continuous mode generator. The latter method was successfully used to measure the scintillation light output of a 1.4 cm diameter spherical NE-213 scintillation detector. The neutron generator has also been used in the continuous search for improved neutron detection techniques. There is a proposal, based on Monte Carlo calculations, of using a scintillation fiber for a fast neutron spectrometer. Due to the slender shape of the fiber, the pattern of produced light gives a peak in the pulse height spectrum instead of the well-known rectangular-like distribution, when the fiber is bombarded end-on by a beam of 14-MeV neutrons. Experimental investigations were undertaken. Detailed investigations on the light transportation property of a short fiber were performed. The predicted peak has not yet been found but the fiber detector may be developed as a directional discrimination fast neutron detector. 18 refs.

24351 (DOE/ER/40678–T2) **Pressurized drift tubes scintillating fiber hadron calorimetry. Final report.** Bromberg, C. (and others); Huston, J.; Miller, R. Michigan State Univ., East Lansing, MI (United States). 22 Mar 1995. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER40678. Order Number DE95014541. Source: OSTI; NTIS; GPO Dep.

Under this contract members of the MSU high energy physics group constructed a full-scale Pressurized Drift Tube Chamber intended for the GEM muon system at the SSC. They achieved a position resolution of <90 μ over the full 5 m^2 area of the detector. This resolution satisfied the GEM resolution requirements of <100 μ by a comfortable margin. Based on their SSC work they developed a new technique for creating wire supports in drift tubes with an overall placement accuracy of <20 μ. This technique requires only simple jigging and can be duplicated and operated at low cost. Also, they participated in the design and testing of a hadron calorimeter prototype for GEM. This work lead the authors to develop a semi-automatic welding machine to fuse together two plastic optical fibers. Copies of this machine are currently in use in the CDF endplug upgrade at Fermilab and additional copies are used widely in calorimeter and fiber-tracker construction.

24352 (ENEA-RT-AMB–94-19) **Field parameters and operational quantities for ICRU sphere with reference photon beams: Monte Carlo and experimental evaluation of angular dependence of dose equivalent quantities. Part 4.** Morelli, B. (Bologna Univ. (Italy). Dipt. di Fisica); Gualdrini, G.F.; Monteventi, F. ENEA, Bologna (Italy). Area Energia Ambiente e Salute. Jul 1994. 150p. CEE F13P-CT920064H. Order Number DE95789775. Source: OSTI; NTIS (US Sales Only).

The present report is the last of four technical reports dealing with the characterization of photon radiation fields for the calibration of personal dosemeters. The analyses, carried out up to now on the ICRU sphere for five different x-ray reference series as stated by ISO (International Standard Organization) and by BIPM (Bureau International des Poids et Mesures), are concerned with a comprehensive study of air kerma backscatter factors for the ICRU sphere; the characterization of backscattered radiation field in terms of backscattered fluence spectrum and mean energy, with an additional study of the dependence on the incident angle; the theoretical and experimental study of the RS-1 tissue substitute material developed at the University of Gottingen; finally a study of the air kerma to directional dose equivalent conversion factors at the three depths of 0.07, 3 and 10 mm in the ICRU sphere, that are summarised in the present report. The results of the analysis in each specific case have been discussed by comparing them with the results obtained in analogous conditions in other European research laboratories and, whereas possible, with experimental data. The present work has been carried out under the CEC contract F13P-CT920064H and is connected with the activities of the EURADOS WG-4 (Numerical Dosimetry).

24353 (ENEA-RT-AMB–94-35) **Absolute measurement of radionuclide activity by sum-peak method: Standard procedures used at ENEA.** De Felice, P. (ENEA, Casaccia (Italy). Area Energia Ambiente e Salute). ENEA, Casaccia (Italy). Area Energia Ambiente e Salute. Dec 1994. 26p. Order Number DE95789742. Source: OSTI; NTIS (US Sales Only).

The sum-peak method is used at ENEA (Italian Agency for New Technologies, Energy and Environment) for the standardization of several radionuclides. The experimental apparatus, based on a NaI(Tl) well type detector, is described and the measurement procedure, for the particular case of the standardization of ^{125}I, is delineated.

24354 (FNAL/C–177-E) **The D0 Upgrade.** Abachi, S. D0 Collaboration. Fermi National Accelerator Lab., Batavia, IL (United States). Jul 1995. 54p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States);CEA, 75 - Paris (France);Russian Atomic Energy Commission, Moscow (Russian Federation);Conselho Nacional de Desenvolvimento Cientifico e Tecnolo DOE Contract AC02-76CH03000. (CONF-950705–1: HEP 95: international Europhysics conference on high-energy physics, Brussels (Belgium), 21-27 Jul 1995). Order Number DE95015356. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper we describe the approved DO Upgrade detector, and its physics capabilities. The DO Upgrade is under construction and will run during the next Fermilab collider running period in early 1999 (Run II). The upgrade is designed to work at the higher luminosities and shorter bunch spacings expected during this run. The major elements of t he upgrade are: a new tracking system with a silicon tracker, scintillating fiber tracker, a 2T solenoid, and a central preshower detector; new calorimeter electronics; new muon trigger and tracking detectors with new muon system electronics; a forward preshower detector; new trigger electronics and DAQ improvements to handle the higher rates.

24355 (FNAL-TM–1943) **Some tests of avalanche photodiodes produced by Advanced Photonix, Inc.** Foster, G.W. (Fermi National Accelerator Lab., Batavia, IL (United States)); Ronzhin, A.; Rusack, R. Fermi National Accelerator Lab., Batavia, IL (United States). Aug 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. Order Number DE95016647. Source: OSTI; NTIS; INIS; GPO Dep.

The goal of the measurements presented here is to check some parameters of the high gain avalanche photodiodes (APD's) produced by Advanced Photonix, Inc. Samples with 16 mm and 5 mm diameter sensitive areas were tested. The tests were performed at FNAL. The new photomultiplier testing facility were used for gain measurements, linearity, and nonuniformity studies. The setup consists of laser with shifted wavelength of 440 nm, 10 Hz repetition rate and a pulse duration of 15 nsec. The laser light was transported to the APD by 1 mm diameter clear fiber. An amount of laser light was adjusted by rotating wheels of fixed light attenuation. The dynamic range of the APD, an amplifier (AMP) and an ADC was about 1000. To get the nonuniformity data the APD was mounted on a moveable stage under management and control of computer. The positioning of the fiber along sensitive surface of the APD was better than 100 microns.

24356 (HW–56696) **Application of neutron monitors to process control in Recuplex. Status report.** Kelly, P.R.; Hildreth, N.T. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 14 Jul 1958. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95014113. Source: OSTI; NTIS; GPO Dep.

A program was. initiated early in 1957 to develop a neutron monitor capable of detecting plutonium (Pu) concentration in process vessels in Recuplex. This followed an earlier application by Finished Products Operation and Research and Engineering of neutron monitoring to powder counting which had been successful and was being regularly used. The process vessel monitoring was to be done by the "in tank probe" method, utilizing the monitored solution as its own-moderator, and detecting the resulting slow and thermal neutrons with boron trifluoride (BF_3) type proportional counters. This report is intended to present the history of the Recuplex program; a summary of the development work to date; the current status of the monitoring system; and the immediate plans for future installations and work. This report is intended as a design guide for presently scheduled and future monitor installations in Recuplex and elsewhere of the types herein described. The report also includes calibration curves for both D-11 tank and H-3 column monitors, schematic representation of all installations, manual switching panel circuit diagram, pre-amplifier circuit diagram, probe well designs, and KI-2 instrument tank design.

24357 (JINR-D–13-92-581) **15. International symposium on nuclear electronics and International seminar CAMAC-92.** Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 290p. (In Russian). (CONF-9209499–: 15. international symposium on nuclear electronics, Warsaw (Poland), 29 Sep - 2 oct 1992). Order Number DE95633648. Source: OSTI; NTIS (US Sales Only); INIS.

The proceedings of the 25. International symposium on nuclear electronics and the CAMAC-92 seminar are presented. The problems on creation of new effective systems for acquisition and processing the information in the field of high energies, spectroscopy and by radiation control at reactors are considered in the reports. Equipment interfaces, analogue-numerical converters, programmed controllers, etc, accomplished relative to the CAMAC and FASTBUS standards are described.

24358 (JINR-D–13-92-581, pp. 111-123) **Position sensitive neutron scintillation detectors for use at various european neutron sources.** Mueller, K.D. (Kernforschungsanlage Juelich GmbH (Germany)); Reinartz, R.; Reinhart, P.; Schaefer, W.; Tenten, W.; Schelten, J. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 290p. (CONF-9209499–: 15. international symposium on nuclear electronics, Warsaw (Poland), 29 Sep - 2 oct 1992). In *15. International symposium on nuclear electronics and International seminar CAMAC-92.* Order Number DE95633648. Source: OSTI; NTIS (US Sales Only); INIS.

Position-sensitive neutron-scintillation detectors of various arrangement and corresponding systems for data acquisition and processing are considered. The IBM computers compatible with EI SA PC, applied as pulse amplitude analyzer with $2x10^6$ channels, are used for the final data memorization. Brief description of multichannel pulse analyzer is given. Problems on application of the EI SA PC bus are considered. 8 refs.; 21 figs.

24359 (JINR-D–13-92-581, pp. 167-171) **Fast coder of analog signals.** Pilyar, A.V. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 290p. (In Russian). (CONF-9209499–: 15. international symposium on nuclear electronics, Warsaw (Poland), 29 Sep - 2 oct 1992). In *15. International symposium on nuclear electronics and International seminar CAMAC-92.* Order Number DE95633648. Source: OSTI; NTIS (US Sales Only); INIS.

The basic characteristics of the fast analogue-to-digital converters and microschemes, on the basis whereof they are assembled, are presented. The eight-channel analogue-to-digital converter is developed in the FASTBus standard for measuring the fast-changing analogue signals. The fast coder is provided for the memory capacity of 256 four-digit words and access time not more than 10 ns. 9 refs.; 1 fig.; 1 tab.

24360 (JINR-D–13-92-581, pp. 188-192) **Application of VME bus for automation of high energy physics experimental installations in JINR.** Bazylev, S.N. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Smirnov, V.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 290p. (In Russian). (CONF-9209499–: 15. international symposium on nuclear electronics, Warsaw (Poland), 29 Sep - 2 oct 1992). In *15. International symposium on nuclear electronics and International seminar CAMAC-92.* Order Number DE95633648. Source: OSTI; NTIS (US Sales Only); INIS.

The SPHERE spectrometer data acquisition system with application of the system kreit in the VME standard is considered. Unification of the recording electronics, data readout processors, processing, memory and interface processors into uniform system is accomplished on the basis of the 32-digit VME bus. Description and basic characteristics of single-play computers, used for the data processing, are presented. 6 refs.; 2 figs.

24361 (JINR-D–13-92-581, pp. 241-247) **The Event Builder module for the NORDBALL multidetector system.** Forycki, A. (Niels Bohr Inst., Copenhagen (Denmark)); Hoy-Christensen, P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 290p. (CONF-9209499–: 15. international symposium on nuclear electronics, Warsaw (Poland), 29 Sep - 2 oct 1992). In *15. International symposium on nuclear electronics and International seminar CAMAC-92.* Order Number DE95633648. Source: OSTI; NTIS (US Sales Only); INIS.

A new Event Builder hardware module has been developed in order to increase the throughput, decrease the dead time, simplify extensions and improve testability and maintainability of the NORDBALL data acquisition system. The module allows an easy implementation of multiple level trigger schemes. When triggered, the device concurrently reads event data through its three input ports (from NIM ADCs, CAMAC modules and multiple FERA-compatible subsystems), merges the data read into one event, adds the event and subevent headers and transmits the complete event to the triple port ECL/VME/VSB memory for subsequent preprocessing in a 32 bit multiprocessor VMEbus subsystem. Due to its parallel and pipelined architecture the hardware Event Builder is capable of collecting from the NORDBALL present electronics up to 50 000 160-byte events/sec. 16 refs.; 2 figs.

24362 (JINR-D–13-92-581, pp. 248-253) **Multidimensional spectrometric data acquisition system on the PC/AT base.** Bogdzel', A.A. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Nguen Chung Tuan. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 290p. (In Russian). (CONF-9209499–: 15. international symposium on nuclear electronics, Warsaw (Poland), 29 Sep - 2 oct 1992). In *15. International symposium on nuclear electronics and International seminar CAMAC-92.* Order Number DE95633648. Source: OSTI; NTIS (US Sales Only); INIS.

Inexpensive system for conducting multiparametric analysis in the nuclear physics experiments is developed on the basis of the PC-AT computer. The maximum number of registered parameters equals 8. The dimensionality of one makes it possible to accomplish the data equisition in multidimensional, unidimensional and combined modes. The time of recording one n-dimensional event constitutes $[1.3+1.1(n-1)]$ μs. 6 refs.; 4 figs.

24363 (JINR-D–13-92-581, pp. 254-258) **Multidetector system for spectrometric data recording and acquisition on the basis of the 64 k * 24 bit memory device.** Bran'kovski, E. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Ermakov, V.A.; Sirotin, A.P.; Chelnokov, M.L.; Shirokov, V.K. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 290p. (In Russian). (CONF-9209499–: 15. international symposium on nuclear electronics, Warsaw (Poland), 29 Sep - 2 oct 1992). In *15. International symposium on nuclear electronics and International seminar CAMAC-92.* Order Number DE95633648. Source: OSTI; NTIS (US Sales Only); INIS.

The programmed detector device (PDD) for multidetector system of spectrometric information recording and acquisition on the basis of the 64 k * 24 bit memory is proposed. The PDD possibilities are considered and its flowsheet is also presented. The spectrometric information storage unit is able to operate with not more than 16 detectors. The maximum number of the time channels is equal to 4096. The pulse width from detectors is not less than 150 ns. The number of events recorded in one time channel for one detector equals not more than 255. 5 refs.; 3 figs.

24364 (JINR-D–13-92-581, pp. 259-262) **Data acquisition system for positron emission tomograph.** Borejko, V.F. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Grebenyuk, V.M.; Mar'in, N.A.; Mitsyn, G.V.; Sidorov, V.T. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 290p. (In Russian). (CONF-9209499–: 15. international symposium on nuclear electronics, Warsaw (Poland), 29 Sep - 2 oct 1992). In *15. International symposium on nuclear electronics and International seminar CAMAC-92.* Order Number DE95633648. Source: OSTI; NTIS (US Sales Only); INIS.

The data acquisition system for positron emission tomograph, containing 512 organic scintillators, is described. The system consists of sixteen 16-channel shaping amplifiers, one unit for useful events selection and buffer storage device with capacity of 2x4 K 16-digit words. The shaping amplifiers are accomplished in the CAMAC standard and the buffer storage device in the IBM PC standard. The processing time for one event is equal to 500 ns. 1 ref.; 3 figs.

24365 (JINR-D–13-92-581, pp. 263-268) **Apparatus method for correction of the ballistic deficit and charge losses on impurities into germanium detectors.** Kalinin, A.I. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 290p. (In Russian). (CONF-9209499–: 15. international symposium on nuclear electronics, Warsaw (Poland), 29 Sep - 2 oct 1992). In *15. International symposium on nuclear electronics and International seminar CAMAC-92.* Order Number DE95633648. Source: OSTI; NTIS (US Sales Only); INIS.

The existing apparatus methods for correction of ballistic deficit and charge losses on impurities in germanium detectors are considered. The correction of ballistic deficit through the Goulding-Landis method, the Hinshaw method and the correction method for triangular form signals is most efficient for improving energy resolution of gamma-spectrometers with large germanium detectors. The flowsheets for correction of the carrier capture effect are based on the information from the fast spectrometric channel. 8 refs.; 4 figs.

24366 (JINR-D–13-92-581, pp. 273-276) **Control system for a programmable multichannel high-voltage source.** Belosludtsev, D.A. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Karzhavin, V.Yu.; Khabarov, V.S.; Khabarov, S.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 290p. (In Russian). (CONF-9209499–: 15. international symposium on nuclear electronics, Warsaw (Poland), 29 Sep - 2 oct 1992). In *15. International symposium on nuclear electronics and International seminar CAMAC-92.* Order Number DE95633648. Source: OSTI; NTIS (US Sales Only); INIS.

The control system for programmable multichannel high-voltage sources, utilized in the high-energy physics for various detectors power supply is presented. The system is based on the modular principle. The high-voltage channels control is accomplished either from the control board through a keyboard or by a program from one computer connected with the control board. The basic functions, which are performed by the control board, developed on the basis of a single-crystal microcontroller, are enumerated. The system provides for control of up to 4096 high-voltage channels. 4 refs.; 3 figs.

24367 (JINR-D–13-92-581, pp. 282-286) **Control by some operating mechanisms in experimental installations TEXT, DVR on the IBR-2, IBR-30 reactors.** Vladimirov, V.A. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Georgiev, D.; Zen En Ken; Lazin, V.I.; Ostrovnoj, A.I.; Petukhova, T.B.; Salamatin, I.M.; Sirotin, A.P.; Trepalin, V.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 290p. (In Russian). (CONF-9209499–: 15. international symposium on nuclear electronics, Warsaw (Poland), 29 Sep - 2 oct 1992). In *15. International symposium on nuclear electronics and International seminar CAMAC-92.* Order Number DE95633648. Source: OSTI; NTIS (US Sales Only); INIS.

Control units for pitch engines and operating mechanisms, applied in high-resolution diffractometers and MURN spectrometers installed in the IBR-2 and IBR-30 reactors are described. The program interfaces and adapters for the operating mechanisms control are considered. The control units are created on the basis of the PC in the CAMAC standard. 5 refs.; 2 figs.

24368 (JINR-D–13-92-581, pp. 287-290) **Automation of radiation monitoring on JINR reactors.** Arkhipov, V.A. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Ishmukhametov, M.Z.; Solodilov, A.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 290p. (In Russian). (CONF-9209499–: 15. international symposium on nuclear electronics, Warsaw (Poland), 29 Sep - 2 oct 1992). In *15. International symposium on nuclear electronics and International seminar CAMAC-92.* Order Number DE95633648. Source: OSTI; NTIS (US Sales Only); INIS.

The system for radiation and dosimetric monitoring on the IBR-30 and IBR-2 reactors (JINR) reactors is described. The radiation monitoring system is developed on the basis of the PRAVETs-16 personal computer and contains two kreits in the CAMAC standard. The maximum distance between the computer and the kreit is equal to 500 m. The number of controlled information channels equals 150. The information exchange speed is 2400 bands. 6 refs.; 1 fig.

24369 (KURRI-TR–388) **Improvements and applications of multilayer neutron interferometer. 1. Precise neutron optics.** Otake, Yoshie (Ibaraki National Coll. of Technology, Hitachinaka (Japan)); Ebisawa, Toru (eds.). Kyoto Univ., Kumatori, Osaka (Japan). Research Reactor Inst. Apr 1994. 89p. (In Japanese, English). (CONF-9311320–: Workshop on high precision neutron optics, Kumatori (Japan), 10 Nov 1993). Order Number DE95789430. Source: OSTI; NTIS; INIS.

This issue is the collection of the papers presented at the title meeting. The 11 of the presented papers are indexed individually. (J.P.N.).

24370 (LA–12893-C, pp. 315-323) **GHz nuclear magnetic resonance.** Cross, T.A.; Drobny, G.; Trewhella, J. Los Alamos National Lab., NM (United States). Dec 1994. (CONF-9403228–: Stable isotope applications in biomolecular structure and mechanisms, Santa Fe, NM (United States), 27-31 Mar 1994). In *Stable isotope applications in biomolecular structure and mechanisms. A meeting to bring together producers and users of stable-isotope-labeled compounds to assess current and future needs.* 382p. Order Number DE95012795. Source: OSTI; NTIS; INIS; GPO Dep.

For the past dozen years, 500- and 600-MHz spectrometers have become available in many laboratories. The first 600-MHz NMR spectrometer (at Carnegie Mellon University) was commissioned more than 15 years ago and, until 1994, represented the highest field available for high-resolution NMR. This year, we have witnessed unprecedented progress in the development of very high field magnets for NMR spectroscopy, including the delivery of the first commercial 750-MHz NMR spectrometers. In addition, NMR signals have been obtained from 20-Tesla magnets (850 MHz for ^1H's) at both Los Alamos National Laboratory and Florida State University in the NHMFL (National High Magnetic Field Laboratory). These preliminary experiments have been performed in magnets with 100-ppm homogeneity, but a 20-Tesla magnet developed for the NHMFL will be brought to field this year with a projected homogeneity of 0.1 ppm over a 1-cm-diam spherical volume.

24371 Apparatus and method for detecting gamma radiation. Sigg, R.A. 1993. Filed date 25 May 1993. U.S. Patent Application 8-066,235. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95015047. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of a high efficiency radiation detector for measuring X-ray and gamma radiation from small-volume, low-activity liquid samples with an overall uncertainty better than 0.7% (one sigma SD). The radiation detector includes a hyperpure germanium well detector, a collimator, and a reference source. The well detector monitors gamma radiation emitted by the reference source and a radioactive isotope or isotopes in a sample source. The radiation from the reference source is collimated to avoid,attenuation of reference source gamma radiation by the sample. Signals from the well detector are processed and stored, and the stored data is analyzed to determine the radioactive isotope(s) content of the sample. Minor self-attenuation corrections are calculated from chemical composition data.

24372 (PNL-SA–26104) **A variety of neutron sensors based on scintillating glass waveguides.** Bliss, M.; Craig, R.A. Pacific Northwest Lab., Richland, WA (United States). May 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9505240–1: Pacific NW fiber optic sensor conference, Troutdale, OR (United States), 3-4 May 1995). Order Number DE95014632. Source: OSTI; NTIS; INIS; GPO Dep.

Pacific Northwest Laboratory (PNL) has fabricated cerium-activated, lithium-silicate glass scintillating fiber neutron sensors via a hot-downdraw process. These fibers typically have a transmission length (e^{-1} length) of greater than 2 meters. The underlying physics of, the properties of, and selected devices incorporating these fibers are described. These fibers constitute an enabling technology for a wide variety of neutron sensors.

24373 (SSCL-Preprint–553) **Vertex detectors.** Lueth, V. Superconducting Super Collider Lab., Dallas, TX (United States). Jul 1992. 81p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-9207140–8: Stanford Linear Accelerator Center (SLAC) summer institute on particle accelerators: third family and the physics of flavor, Stanford, CA (United States), 13-24 Jul 1992). Order Number DE95011156. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of a vertex detector is to measure position and angles of charged particle tracks to sufficient precision so as to be able to separate tracks originating from decay vertices from those produced at the interaction vertex. Such measurements are interesting because they permit the detection of weakly decaying particles with lifetimes down to 10^{-13} s, among them the τ lepton and charm and beauty hadrons. These two lectures are intended to introduce the reader to the different techniques for the detection of secondary vertices that have been developed over the past decades. The first lecture includes a brief introduction to the methods used to detect secondary vertices and to estimate particle lifetimes. It describes the traditional technologies, based on photographic recording in emulsions and on film of bubble chambers, and introduces fast electronic registration of signals derived from scintillating fibers, drift chambers and gaseous micro-strip chambers. The second lecture is devoted to solid state detectors. It begins with a brief introduction into semiconductor devices, and then describes the application of large arrays of strip and pixel diodes for charged particle tracking. These lectures can only serve as an introduction the topic of vertex detectors. Time and space do not allow for an in-depth coverage of many of the interesting aspects of vertex detector design and operation.

24374 (SSC-SR–1021) **Report of the Task Force on detector Research and Development for the Superconducting Super Collider.** Lawrence Berkeley Lab., CA (United States). SSC Central Design Group. Jun 1986. 315p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE95011083. Source: OSTI; NTIS; GPO Dep.

This report contains a: Report of the working group on tracking devices; report of the working group on calorimetry; report of the working group on muon, electron and hadron identification; report of the working group on electronics, triggering, data acquisition and computing; report of the working group on superconducting magnets; and report of the working group on Monte Carlo development.

24375 (UCRL-ID–120286) **Monte Carlo study of a high-sensitivity gamma-ray detection system.** Decman, D.J.; Namboodiri, M.N. Lawrence Livermore National Lab., CA (United States). Mar 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015417. Source: OSTI; NTIS; INIS; GPO Dep.

The authors use Monte Carlo calculations to study a new design for a high-sensitivity gamma-ray detection system. The system uses an array of high-purity germanium detectors operating with an event-mode data acquisition system. The calculations show that the proposed design could produce a factor of 10 increase in the sensitivity of these measurements compared to currently employed systems.

24376 (UCRL-ID–120307) **Interim cryo-cooler/detector report.** Neufeld, K. (Lawrence Livermore National Lab., CA (United States)); Ruhter, W.; Anderson, E. Lawrence Livermore National Lab., CA (United States). 19 Apr 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015850. Source: OSTI; NTIS; GPO Dep.

This report describes development of an electronic system designed to reduce vibration generated by a cryocooler. The diminished vibration makes it practical to use the active cooler to extract heat from a portable gamma ray detector instrument. The system was developed for a Sunpower cryocooler with an integrated counterbalance mass. The overall momentum cancellation approach is also applicable to other similar cryocoolers. The cancellation system is an assembly of several components tailored to accomplish the required vibration reduction with minimum power consumption and volume. It is designed to be powered by a 18–32 Volt battery. Up to ten harmonics of the 58.65 Hz drive frequency are controlled. In addition to the vibration cancellation, the electronic system produces the drive signal for the cryocooler and regulates the cooler temperature. The system employs a sinusoidal drive to reduce the amount of higher harmonic vibration. A digital signal processor (DSP) is used to perform the high speed vibration control. The Texas Instruments TMS320C31 processor is housed on a third-party board. A second board has analog-to-digital (A/D) and digital-to-analog (D/A) converters. The DSP was programmed in C. The physical system consists of two sets of electronics. The first is housed in a case that is separate from the detector unit.

24377 (UCRL-ID–121571) **Physics with the collider detectors at RHIC and the LHC.** Thomas, J.; Hallman, T. (eds.). Lawrence Berkeley Lab., CA (United States). 15 Jul 1995. 212p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950198–: Physics with the collider detectors at Relavitistic Heavy Ion Collider (RHIC) and the LHC, Livermore, CA (United States), 8 Jan 1995). Order Number DE95015976. Source: OSTI; NTIS; INIS; GPO Dep.

On January 8, 1995, over 180 participants gathered to hear the QM95 preconference workshop on 'Physics with the Collider Detectors at RHIC and the LHC'. The goal was to bring together the experimentalists from a wide community of hadron and heavy ion collider detector collaborations. The speakers were encouraged to present the current status of their detectors, with all the blemishes, and the audience was encouraged to share their successes and failures in approaching similar detector design issues. The presentations were excellent and the discussions were lively and stimulating. The editors hope that the reader will find these proceedings to be equally stimulating. Separate abstracts have been submitted to the energy database from articles in this report.

24378 (UCRL-JC–118290) **MID-IR detection: Detector circuitry and noise.** Blum, A. (and others); Gates, A.; Montoya, M. Lawrence Livermore National Lab., CA (United States). Jul 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9404162–21: 1994 chemical analysis by laser interrogation of proliferation effluents (CALIOPE ITR) interim technical review, Livermore, CA (United States), 26-28 Apr 1994). Order Number DE95014159. Source: OSTI; NTIS; GPO Dep.

Our ability to measure the spectral transmission of the atmosphere is limited in two ways. First, by noise that is added to the returning signal by random processes such as electronic noise and the random emission of IR photons. Second, by speckle that acts as a wavelength dependent multiplier of the returning signal amplitude. In this paper we report our estimates of the effects of added random noise on the measurements planned for the October field tests. We do not consider speckle which is fundamentally different from "additive noise" and is being separately considered by others. The system which will be fielded by LLNL in October '94 will transmit on and off resonance wave-lengths $\lambda 1$ and $\lambda 2$. The integral of the returning signal as well as an integral of the transmitted signal will be recorded at each wavelength. From these the transmission can be calculated. The two returning wavelengths are separated in a spectrograph and sent to detectors in a 16-element array. Each detector is followed by an amplifier. To maintain good system linearity, nominally constant detector voltage, and large dynamic range, it is desirable that the amplifier input be a virtual ground. Either a linear transimpedance amplifier or negative feedback charge sensitive can satisfy this requirement. Two of the 16 amplifier outputs are selected by a multiplexer and passed to data processing and/or recording hardware. The charge sensitive amplifier integrates the arriving current and we need only record its output. The digital sampling (waveform capture) hardware can be used in a mode in which it records the integrated outputs.

24379 (UCRL-JC–119320) **The BaBar cesium iodide electromagnetic calorimeter.** Wuest, C.R. Lawrence Livermore National Lab., CA (United States). Dec 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9410317–4: IHEP: 1994 Beijing calorimetry symposium, Beijing (China), 25-27 Oct 1994). Order Number DE95011755. Source: OSTI; NTIS; GPO Dep.

The BABAR Cesium Iodide Electromagnetic Calorimeter is currently in the technical design stage. The calorimeter consists of approximately 10,000 individual thallium-doped cesium iodide crystals arranged in a near-hermetic barrel and endcap structure. Taking previous cesium iodide calorimeters as a benchmark, we hope to build a system with roughly two times better energy resolution. This will be achieved by a combination of high quality crystal growing, precision mechanical processing of crystals and support structure, highly efficient light collection and low noise readout electronics. The calorimeter described here represents the current state of the design and we are undertaking an active period of optimization before this design is finalized. We discuss here the physics motivation, the current design and options for optimization.

New developments in 2-D, wide-bandwidth HgCdTe (MCT) and GaAs quantum-well infrared photodetectors (QWIP) coupled with Monolithic Microwave Integrated Circuit (MMIC) technology are now making focal plane array coherent infrared (IR) cameras viable. Unlike conventional IR cameras which provide only thermal data about a scene or target, a coherent camera based on optical heterodyne interferometry will also provide spectral and range information. Each pixel of the camera, consisting of a single photosensitive heterodyne mixer followed by an intermediate frequency amplifier and illuminated by a separate local oscillator beam, constitutes a complete optical heterodyne receiver. Applications of coherent IR cameras are numerous and include target surveillance, range detection, chemical plume evolution, monitoring stack plume emissions, and wind shear detection.

A prototype 10 inch flat panel Planar Optic display, (POD), screen has been constructed and tested. This display screen is comprised of hundreds of planar optic glass sheets bonded together with a cladding layer between each sheet where each glass sheet represents a vertical line of resolution. The display is 9 inches wide by 5 inches high and approximately 1 inch thick. A 3 milliwatt HeNe laser is used as the illumination source and a vector scanning technique is employed.

Source: OSTI; NTIS; GPO Dep.

The University of Wisconsin High Spectral Resolution Lidar (HSRL) has been recently redesigned for operation in an electronics semitrailer van. The HSRL can now be deployed in support of field experiments. This paper presents initial observations with the new configuration along with an analysis of measurement accuracy. New measurement capabilities have been added. These include: observation of the signal variation with angular field of view, and observation of depolarization in all data channels. Depolarization measurements have been implemented by transmitting orthogonal linear polarizations on alternate laser pulses. Pulses are transmitted at 250 μs intervals such that the lidar observes the same ensemble of particles for both polarizations. Orthogonal polarizations are measured with a single detector per channel. Since the optical components and detector gains are identical for the two polarizations the measured depolarization ratios are independent of these factors and the system delivers very precise depolarizations. A new data channel with a computer controlled aperture allows measurements of multiple scattering as a function of receiver field of view. Since the field of view variation is dependent on the size of the scattering particles it is expected that this will allow remote measurements of cloud particle size. Other technical improvements in the new system include active control of spectrometer temperatures, greatly increased mechanical stability, an increased receiver aperture, injection of calibration signals into the signal profiles to allow continuous monitoring of system calibration drifts, and extensive computer control of system operations.

24383 (DOE/METC/C–95/7186) **Single port access holographic particle image velocimetry.** Woodruff, S.D. (USDOE Morgantown Energy Technology Center, WV (United States)); Richards, G.A.; Cha, D.J. USDOE Morgantown Energy Technology Center, WV (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). (CONF-950853–6: ASME/JSME annual summer meeting of the Fluids Engineering conference, Hilton Head, SC (United States), 13-17 Aug 1995). Order Number DE95014564. Source: OSTI; NTIS; GPO Dep.

An optical system, which requires only a single optical window mounted on a test volume, is proposed for holographic particle image velocimetry (HPIV). The optical system is a derivative of the double-exposure, double-reference-beam, off-axis HPIV system, but the innovative idea behind the system is to use back scattered light from the particles as the object wave. A 45° beam splitter inserted in front of the window serves to admit the illuminating beam and extract the back scattered light. This concept can be of great engineering interest because optical access is often limited to one window in practical devices. The preliminary results of the technique appear quite promising, with current studies aimed at defining the optical resolution capabilities.

24384 (ENEA-RT-AMB–93-23) **In situ laser scattering for analysis of spherical aerosol particles.** Neri, E. (ENEA, Casaccia (Italy). Area Energia Ambiente e Salute). ENEA, Casaccia (Italy). Area Energia Ambiente e Salute. Mar 1994. 31p. (In Italian). Order Number DE95789706. Source: OSTI; NTIS (US Sales Only).

The operation features of an in situ laser light scattering spectrometer that performs the analysis of spherical aerosol particles without sampling them out of the main stream, are described. The spectrometer is conceived to the purpose of examining individual particles, primarily within the 0.1 - 3.0 μm size range, whatever the refractive index is. The issue is attained by the simultaneous measurement and analysis of the angular intensity distribution of the laser radiation (lamda = 514.5 nm) scattered by each particle. The proper selection of the collection angles, in the scattering plane, has been made to the end of optimizing the size spectral resolution of the instrument, in relation to the size range of interest. The use of a set of different slits allows to finely adjust the size of the scattering volume (Vs). In this way, it can afford the handling of up to 10^6 part/cm^3, in single particle mode. The control over the quality of the angular sampling of the radiation scattered by the particles is based upon the analysis of the signal shape, continuously monitored at the 90^0 PMT output. The results obtained by performing the realistic simulation of the optical system, showed us that the convergence of the fitting procedure (X^2 minimization program) can be attained, provided that the data collected at the selected angles are affected by a percentage error of the order of 10%.

24385 (ORNL/TM–12978) **The least squares fit of a hyperplane to uncertain data.** Reister, D.B. Oak Ridge National Lab., TN (United States). May 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95013508. Source: OSTI; NTIS; GPO Dep.

The authors became interested in this problem because they wanted to calibrate their laser range cameras. Laser range cameras are powerful tools for defining the Cartesian coordinates of surfaces of objects in an environment. The camera scans a laser beam over a scene and determines the distance (τ) by the time required for the beam to reach an object and return. The beam is directed back and forth (ϕ) and up and down θ by two rotating mirrors. Thus, the data measured by the camera has the form (τ, ϕ, θ). The geometry of the camera can be used to map the measured data to Cartesian coordinates (x, y, z). Since the geometry of the camera may not be known precisely, the cameras can be calibrated by comparing the calculated surface shapes to the known surface shapes. The most simple surface is a plane and many physical objects have planar surfaces. Thus, an important problem in the calibration of range cameras is to find the best (least squares) fit of a plane to a set of 3D points. For many least squares problems, the uncertainty is in one of the variables [for example, y = f(x) or z = f(xy)]. However, for some problems, the uncertainty is in the geometric transformation from measured data to Cartesian coordinates and all of the calculated variables are uncertain. The authors have formulated a constrained optimization problem to determine the least squares fit of a hyperplane to uncertain data. The first order necessary conditions require the solution of an eigenvalue problem. They have shown that the solution satisfies the second order conditions (the Hessian matrix is positive definite). Thus, the solution satisfies the sufficient conditions for a local minimum. They have performed numerical experiments that demonstrate that the solution is superior to alternative methods.

24386 Fiber optic probe having fibers with endfaces formed for improved coupling efficiency. O'Rourke, P.E.; Livingston, R.R. 1993. Filed date 4 May 1993. U.S. Patent Application 8-056,390. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95015102. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of a fiber optic probe for detecting scattered light, with transmitting and receiving fibers having slanted ends and bundled together to form a bevel within the tip of the probe. The probe comprises a housing with a transparent window across its tip for protecting the transmitting and receiving fibers held therein. The endfaces of the fibers are slanted, by cutting, polishing and the like, so that they lie in a plane that is not perpendicular to the longitudinal axis of the respective fiber. The fibers are held in the tip of the probe using an epoxy and oriented so that lines normal to the slanted endfaces are divergent with respect to one another. The epoxy, which is positioned substantially between the transmitting and receiving fibers, is tapered so that the transmitting fiber, the epoxy and the receiving fiber form a bevel of not more than 20 degrees. The angled fiber endfaces cause directing of the light cones toward each other, resulting in improved light coupling efficiency. A light absorber, such as carbon black, is contained in the epoxy to reduce crosstalk between the transmitting and receiving fibers.

24387 Magnetron cathodes in plasma electrode pockets cells. Rhodes, M.A. 1993. Filed date 10 May 1993. U.S. Patent Application 8-058,844. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015101. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of Magnetron cathodes, which produce high current discharges and form greatly improved plasma electrodes on each side of an electro-optic crystal. The plasma electrode comprises a low pressure gas region on both sides of the crystal. When the gas is ionized, e.g., by a glow discharge in the low pressure gas, the plasma formed is a good conductor. The gas electrode acts as a highly uniform conducting electrode. Since the plasma is transparent to a high energy laser beam passing through the crystal, the plasma is transparent. A crystal exposed from two sides to such a plasma can be charged up uniformly to any desired voltage. A typical configuration utilizes helium at 50 millitorr operating pressure and 2kA discharge current. The magnetron cathode produces a more uniform plasma and allows a reduced operating pressure which leads to lower plasma resistivity and a more uniform charge on the crystal.

24388 An analog edge detector with simultaneous background suppression. Munroe, J.L. 1993. Filed date 27 May 1993. U.S. Patent Application 8-067,912. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95015043. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of an analog edge detector that utilizes masking techniques to provide modulation of spatial frequencies of interest, while suppressing other frequencies. A mask defining two or more subapertures is placed in close proximity to one or more apertures. The placement of the subapertures within the mask determines the frequency range to be modulated. In order to scan all directions, the mask can be rotated about the optical axis of the one or more apertures. As the subapertures are placed sparsely within the mask, the completely covered portions of the one or more apertures could be discarded, greatly reducing the weight of the apparatus. Subsequent image processing can include transform lenses to provide a Fourier transform of the image, and a spatially filtered image. A dc block can be used to block the near zero frequencies. A neural network or an optical correlometer can be connected to receive the Fourier transform image or the spatially filtered image for processing and output.

24389 (PNL-SA–26103) **Large-area fiber-optic chemical sensors.** Bliss, M.; Craig, R.A. Pacific Northwest Lab., Richland, WA (United States). May 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9505240–2: Pacific NW fiber optic sensor conference, Troutdale, OR (United States), 3-4 May 1995). Order Number DE95014633. Source: OSTI; NTIS; GPO Dep.

Pacific Northwest Laboratory is developing a large-area chemical sensor that combines chemically selective coatings and optical

spectroscopy to detect target compounds. The chemically selective material is incorporated into the cladding of an optical fiber waveguide. The material is interrogated using optical spectroscopic techniques to determine the concentration of target compounds. The optical interrogation method includes two spectroscopies: visible-near infrared absorption spectroscopy and Raman spectroscopy. This work develops the physical and mathematical models of such a sensor and provides a set of tools with which to make design predictions for the large-area chemical sensors. The theoretical relationships derived herein allow the use of bulk absorption parameters and bulk Raman coefficients to predict sensor performance.

24390 (PNL-SA–26254) **Pacific Northwest Laboratory CALIOPE overview.** McDowell, R.S.; Kelly, J.F.; Sharpe, S.W. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9503149–6: 2. chemical analysis by laser interrogation of proliferation effluents (CALIOPE) meeting, Albuquerque, NM (United States), 28-30 Mar 1995). Order Number DE95014174. Source: OSTI; NTIS; GPO Dep.

This overview covers progress in the following areas in which Pacific Northwest Laboratory contributes to the CALIOPE Program: (1) Fabrication of electro-optic modulators to generate FM-coding on IR lasers in the 8-12 and 3-5 μm regions. (2) IR spectroscopy of signature species, abnormal isotopic distributions, hydrolysis and kinetics of effluents interacting with the atmosphere, and reflectance measurements of natural surfaces. (3) Systems analysis of FM-DIAL concepts, including lateral phase coherence and MTF measurements, and laboratory tests of detector technology and demodulation methods. (4) Field tests of FM-DIAL, covering field validation of portable diode laser concepts, FM-CO_2 interrogation of Hanford sites, and signal returns from natural specular surfaces. (5) Ancillary matters: ground-truthing at Hanford (and RSTR?), countermeasures, and new laser design concepts.

24391 (SAND–95-1306C) **Phosphors for flat panel emissive displays.** Anderson, M.T.; Walko, R.J.; Phillips, M.L.F. Sandia National Labs., Albuquerque, NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950401–14: 97. annual meeting of the American Ceramic Society, Cincinnati, OH (United States), 30 Apr - 1 may 1995). Order Number DE95014218. Source: OSTI; NTIS; GPO Dep.

An overview of emissive display technologies is presented. Display types briefly described include: cathode ray tubes (CRTs), field emission displays (FEDs), electroluminescent displays (ELDs), and plasma display panels (PDPs). The critical role of phosphors in further development of the latter three flat panel emissive display technologies is outlined. The need for stable, efficient red, green, and blue phosphors for RGB fall color displays is emphasized.

24392 (UCRL-CR–119635) **Fatigue expectations in a molybdenum/silicon multilayer under pulsed soft X-ray radiation.** Weber, F.J. (Oregon State Univ., Corvallis, OR (United States)); Kassner, M.E.; Stearns, D.G. Lawrence Livermore National Lab., CA (United States). 19 Jan 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95014123. Source: OSTI; NTIS; INIS; GPO Dep.

The temperature rise in a Mo/a-Si multilayer x-ray reflective film due to radiation absorption is modeled for the first condenser mirror in a projection lithography system such as the one designed by the Advanced Microtechnology Program at LLNL. The radiation load is pulsed at 1000 Hz with a time average intensity of 500mW/cm^2. This intensity is the expected maximum on the first condenser mirror. The temperature rise is calculated using the integral transform technique. The film is assumed to have the thermal properties of its poorly conducting substrate, yielding a more conservative (higher) temperature estimate. The surface temperature rise is found to range between 35.6°C and 76.3°C. The stress due to this rise is greatest in the molybdenum film and ranges between 73MPa and 166MPa compressive. This fluctuating stress level, however, is believed to be insufficient, by a factor of five or so, to cause fatigue failure of the film.

24393 (UCRL-ID–119254) **An expanded porphyrin approach toward transactinium chelation and the development of porphyrin-coated optical fibers as potential actinide sensors.** Klunder, G. (Lawrence Berkeley Lab., CA (United States)); Silva, R. Lawrence Livermore National Lab., CA (United States). Dec 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015847. Source: OSTI; NTIS; GPO Dep.

Characterization of the contamination at DOE waste sites and facilities is necessary during environmental restoration. Characterization of toxic waste in containers and storage tanks is needed for effective waste management. Therefore, analytical and monitoring systems are needed for real-time analysis and feedback. The development of in-situ methods to measure chemical properties by specialized instrumentation capable of real-time analysis, without sacrificing sensitivity, has been identified as an area of needed development. Absorption spectroscopy is widely used and considered to be one of the most reliable techniques available for the qualitative and quantitative determination of sample composition. With the advancements in fiber optic technology, using light for remote in-situ sensing of groundwater contaminants has become practical. Significant progress has been made in the area of fiber-optic chemical sensors as can be seen by the number of recent review articles. The objective of this work is to develop a remote sensor for real-time measurement of actinides and concentrations in environmental or process waters based on absorption spectroscopy using internal reflection spectroscopy. Porphyrin coated silica wafers were prepared and the sensitivity and selectivity to actinides was determined.

24394 (UCRL-JC–118195) **Spectroscopy and decay kinetics of Pr^{3+}-doped chloride crystals for 1300-nm optical amplifiers.** Page, R.H. (and others); Schaffers, K.I.; Wilke, G.D. Lawrence Livermore National Lab., CA (United States). 9 Mar 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950101–6: Advanced solid-state laser conference, Memphis, TN (United States), 29 Jan - 1 feb 1995). Order Number DE95014369. Source: OSTI; NTIS; INIS; GPO Dep.

Several Pr^{3+}-doped chloride crystals have been tested spectroscopically for suitability as 1300-nm optical amplifiers operating on the $^1G_4$ - $^3H_5$ transition. $^1G_4$ lifetimes are much longer than in fluoride hosts, ranging up to 1300 μsec and suggesting a near-unity luminescence quantum yield. Emission spectra are typically broad (FWHM $\sim$ 70 nm) and include the 1310-nm zero-dispersion wavelength of standard telecommunications fiber.

24395 (UCRL-JC–119165) **Infrared hyperspectral imaging results from vapor plume experiments.** Bennett, C.L. (and others); Carter, M.R.; Fields, D.J. Lawrence Livermore National Lab., CA (United States). 17 Apr 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950472–12: SPIE international symposium on aerospace/defense sensing and dual-use photonics, Orlando, FL (United States), 17-21 Apr 1995). Order Number DE95014392. Source: OSTI; NTIS; GPO Dep.

In this article, recent measurements made with LIFTIRS, the Livermore Imaging Fourier Transform InfraRed Spectrometer, are presented. The experience gained with this instrument has produced a variety of insights into the tradeoffs between signal to noise ratio (SNR), spectral resolution and temporal resolution for time multiplexed Fourier transform imaging spectrometers. This experience has also clarified the practical advantages and disadvantages of Fourier transform hyperspectral imaging spectrometers regarding adaptation to varying measurement requirements on SNR vs. spectral resolution, spatial resolution and temporal resolution.

24396 (UCRL-JC–119627) **Advanced source studies on laser produced plasmas for EUV lithography.** Spitzer, R.C.; Gaines, D.P. Lawrence Livermore National Lab., CA (United States). 19 Jan 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9409177–15: Optical Society of America conference on extreme ultraviolet lithography, Monterey, CA (United States), 19-21 Sep 1994). Order Number DE95014677. Source: OSTI; NTIS; GPO Dep.

Laser-produced plasmas are source candidates for EUV lithography. The radiation angular distribution for several target materials is investigated and source debris is characterized.

24397 (UCRL-ID–120168) **A qualitative study of internal wave ship wakes: Dependence on environmental conditions and experimental parameters.** Mullenhoff, C.J.; Brase, J.M. Lawrence Livermore National Lab., CA (United States). 24 Apr 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95015849. Source: OSTI; NTIS; GPO Dep.

For the past several years the UK-US Radar Ocean Imaging Program has conducted a series of field experiments with the primary purpose of gathering real aperture radar (RAR) imagery at low grazing angle of ship-generated internal wave (IW) wakes. The first observations with RAR's were made in the 1989 Loch Linnhe experiment where it was observed that radar images at low grazing angles (LGA) of approximately six degrees had significantly higher modulation levels than SAR images made at higher grazing angles of 35 - 65 degrees. These initial observations have led to several more experiments designed to verify the phenomenon and to test its dependence on experimental and environmental conditions. A parallel effort began to develop theoretical models of the LGA imaging process. Through this series of experiments we have developed an extensive database of radar imagery and supporting environmental data. The objective of this report is twofold: (1) To describe the database and the associated space of parameters. We will look at the coverage of the parameter space within the database and at areas which should be covered. (2) To take an initial look at the dependence of qualitative modulation strength on the experimental and environmental parameters. This first look will indicate the strongest dependencies which can then be studied in more detail. Section 2 describes the experimental database and Section 3 discusses the parameter space, image quality, and their relationships based on the images in the database. In Section 4 we summarize our conclusions and make recommendations for both future analyses and experiments.

A system is being designed for the inspection of turbine blades. This report describes progress made with the hardware and software for the system.

24399 Method and apparatus for analyzing eddy-current test measurements. Levy, A.J. 1993. Filed date 10 May 1993. U.S. Patent Application 8-058,850. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC12-76SN00052. Order Number DE95015050. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Eddy-current response voltages, generated during inspection of metallic structures for anomalies, are often replete with noise. Therefore, analysis of the inspection data and results is difficult or near impossible, resulting in inconsistent or unreliable evaluation of the structure. This invention processes the eddy-current response voltage, removing the effect of random noise, to allow proper identification of anomalies within and associated with the structure.

24400 Ion cyclotron resonance cell. Weller, R.R. 1993. Filed date 4 May 1993. U.S. Patent Application 8-064,887. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95015049. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of an ion cyclotron resonance cell having two adjacent sections separated by a center trapping plate. The first section is defined by the center trapping plate, a first end trapping plate, and excitation and detector electrodes. The second section includes a second end trapping plate spaced apart from the center plate, a mirror, and an analyzer. The analyzer includes a wavelength-selective light detector, such as a detector incorporating an acousto-optical device (AOD) and a photodetector. One or more ion guides, grounded plates with holes for the ion beam, are positioned within the vacuum chamber of the mass spectrometer between the ion source and the cell. After ions are trapped and analyzed by ion cyclotron resonance techniques in the first section, the ions of interest are selected according to their mass and passed into the second section for optical spectroscopic studies. The trapped ions are excited by light from a laser and caused thereby to fluoresce. The fluorescent light emitted by the excited ions is reflected by the mirror and directed onto the detector. The AOD is scanned, and the photodetector output is recorded and analyzed. The ions remain in the second section for an extended period, enabling multiple studies to be carried out on the same ensemble of ions.

24401 Monitoring probe for groundwater flow. Looney, B.B.; Ballard, S. 1993. Filed date 25 May 1993. U.S. Patent Application 8-066,236. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95015046. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of a monitoring probe for detecting groundwater migration. The monitor features a cylinder made of a permeable membrane carrying an array of electrical conductivity sensors on its outer surface. The cylinder is filled with a fluid that has a conductivity different than the groundwater. The probe is placed in the ground at an area of interest to be monitored. The fluid, typically saltwater, diffuses through the permeable membrane into the groundwater. The flow of groundwater passing around the permeable membrane walls of the cylinder carries the conductive fluid in the same general direction and distorts the conductivity field measured by the sensors. The degree of distortion from top to bottom and around the probe is precisely related to the vertical and horizontal flow rates, respectively. The electrical conductivities measured by the sensors about the outer surface of the probe are analyzed to determine the rate and direction of the groundwater flow.
